1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 1-33

No. 1-18

THURSDAY, FEBRUARY 17, 1966

THURSDAY, APRIL 21, 1966

Respecting the subject-matter of

- Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles)
Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles)
Bill C-87, An Act to amend the Criminal Code (Impaired Driving)
Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and
Private Members' Notices of Motions Numbers 26 and 31.

WITNESS:

Mr. Yves Forest, M.P., Sponsor of Bill C-118.

ROGER DUHAMEL, F.R.S.C.

STANDING COMMITTEE

ON

STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS

*Chairman: Mr. A. J. P. Cameron**Vice-Chairman: Mr. Yves Forest*

and

Mr. Aiken,	Mr. Goyer,	Mr. Nielsen,
Mr. Asselin (Charlevoix),	Mr. Honey,	Mr. Otto,
Mr. Bell (Carleton),	Mr. Laflamme,	Mr. Ryan,
Mr. Cantin,	Mr. Langlois (Mégantic),	Mr. Scott (Danforth),
Mr. Choquette,	Mr. Mather,	Mr. Stanbury,
Mr. Chrétien,	Mr. MacEwan,	Mr. Trudeau,
Mr. Fulton	Mr. McQuaid,	Mr. Wahn,
		Mr. Woolliams—(24).

Gabrielle Savard,

Clerk of the Committee.

(Quorum 13)

NOTE: Mr. Scott (Danforth) replaced Mr. Lewis and Mr. Mather replaced Mr. Brewin on April 20, 1966.

ORDERS OF REFERENCE

Monday, February 7, 1966.

Resolved,—That the following Members do compose the Standing Committee on Justice and Legal Affairs:

Messrs.

Aiken,	Forest,	McQuaid,
Asselin (Charlevoix),	Fulton,	Nielsen,
Bell (Carleton),	Goyer,	Otto,
Brewin,	Honey,	Ryan,
Cameron (High Park),	Laflamme,	Stanbury,
Cantin,	Langlois (Mégantic),	Trudeau,
Choquette,	Lewis,	Wahn,
Chrétien,	MacEwan,	Woolliams—(24)

MONDAY, February 21, 1966.

Ordered,—That the subject-matter of each of the following bills be referred to the Standing Committee on Justice and Legal Affairs:

Bill C-16, An Act to provide in Canada for the Dissolution of Marriage (Additional Grounds for Divorce).

Bill C-19, An Act to provide in Canada for the Dissolution and the Annulment of Marriage.

Bill C-41, An Act to amend the British North America Acts, 1867 to 1965, (Provincial Marriage and Divorce Laws).

Bill C-44, An Act to provide in Canada for the Dissolution of Marriage.

Bill C-55, An Act to provide in Canada for the Dissolution of Marriage.

Bill C-58, An Act respecting Marriage and Divorce.

Bill C-79, An Act to amend the Dissolution and Annulment of Marriages Act (Additional Grounds for Divorce).

TUESDAY, March 15, 1966.

Ordered,—That the Order of the House of Monday, February 21, 1966 referring the subject-matter of the following bills to the Standing Committee on Justice and Legal Affairs be discharged:

Bill C-16, An Act to provide in Canada for the Dissolution of Marriage (Additional Grounds for Divorce).

Bill C-19, An Act to provide in Canada for the Dissolution and the Annulment of Marriage.

Bill C-41, An Act to amend the British North America Acts, 1867 to 1965, (Provincial Marriage and Divorce Laws).

Bill C-44, An Act to provide in Canada for the Dissolution of Marriage.

Bill C-55, An Act to provide in Canada for the Dissolution of Marriage.

Bill C-58, An Act respecting Marriage and Divorce.

Bill C-79, An Act to amend the Dissolution and Annulment of Marriages Act (Additional Grounds for Divorce).

WEDNESDAY, March 30, 1966.

Ordered,—That the subject-matter of the following Private Members' Bills, be referred to the Standing Committee on Justice and Legal Affairs:

Bill C-26, An Act to amend the Criminal Code (Safety Devices for Vehicles).

Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).

Bill C-87, An Act to amend the Criminal Code (Impaired Driving).

Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles).

Ordered,—That the subject-matter of Private Members' Notices of Motions Numbers 26 and 31, be referred to the Standing Committee on Justice and Legal Affairs.

WEDNESDAY, April 20, 1966.

Ordered,—That the name of Mr. Scott (Danforth) be substituted for that of Mr. Lewis on the Standing Committee on Justice and Legal Affairs.

Ordered,—That the name of Mr. Mather be substituted for that of Mr. Brewin on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House.

MINUTES OF PROCEEDINGS

THURSDAY, February 17, 1966.

(1)

The Standing Committee on Justice and Legal Affairs met this day at 11.30 a.m. for organization purposes.

Members present: Messrs. Aiken, Asselin (*Charlevoix*), Brewin, Cameron (*High Park*), Choquette, Chrétien, Forest, Fulton, Goyer, Laflamme, Lewis, McQuaid, Otto, Ryan, Stanbury, Trudeau, Wahn (17).

The Clerk attending and having called for nominations, Mr. Otto moved, seconded by Mr. Ryan, That Mr. Cameron be elected Chairman of this Committee.

There being no other nominations, the Clerk declared Mr. Cameron elected Chairman and invited him to take the Chair.

Mr. Cameron thanked the Committee for the honour bestowed upon him and then invited nominations for Vice-Chairman.

Mr. Asselin, seconded by Mr. Trudeau, moved that Mr. Fulton be elected Vice-Chairman of this Committee.

Mr. Chrétien, seconded by Mr. Ryan, moved that Mr. Forest be elected Vice-Chairman of this Committee.

Mr. Fulton asked permission to withdraw his name and by unanimous consent the mover and the seconder nominating Mr. Fulton withdrew their motion.

Mr. Choquette, seconded by Mr. Wahn, moved that nominations be closed. The Chairman declared Mr. Forest elected Vice-Chairman of the Committee.

On motion of Mr. Wahn, seconded by Mr. Choquette,

Resolved,—That a subcommittee on Agenda and Procedure comprised of the Chairman, the Vice-Chairman and three members to be named by the Chairman upon consultation with the Whips of the parties, be appointed.

Mr. Brewin moved, seconded by Mr. Wahn,

That the Chairman be requested (a) to inquire into whether the estimates of the Minister of Justice and of the Solicitor General are automatically referred to this committee, or whether a further motion in the House is required for this purpose, and if this latter (b) to request the appropriate authority to introduce the motion as soon as possible.

After discussion, Mr. Fulton moved in amendment that all the words after *That* be deleted and the following substituted:

The matter of the items and subjects to be referred to this Committee be taken up urgently by the Steering Subcommittee and a report thereon be made by them to the next meeting of this Committee.

The amendment was defeated on the following division: Yeas, 7; Nays, 8.

The question being put on the main motion, it was negatived on the following division: Yeas, 7; Nays, 8.

There being no other business before the Committee, at 11.25 a.m., on motion of Mr. Stanbury, seconded by Mr. Trudeau, the Committee adjourned to the call of the Chair.

Gabrielle Savard
Clerk of the Committee.

THURSDAY, April 21, 1966.

(2)

The Standing Committee on Justice and Legal Affairs met at 11:10 a.m. this day. The Chairman, Mr. A. J. P. Cameron, presided.

Members present: Messrs. Aiken, Bell (*Carleton*), Cameron (*High Park*), Cantin, Choquette, Chrétien, Forest, Laflamme, MacEwan, Mather, McQuaid, Nielsen, Otto, Scott (*Danforth*), Stanbury (15).

In attendance: Mr. Yves Forest, M.P., sponsor of Bill C-118 (An Act to amend the Criminal Code: Negligence in operation of motor vehicle), and Mr. R. R. Southam, M.P., sponsor of Bill C-26 (An Act to amend the Criminal Code: Safety Devices for Automotive Vehicles).

The Chairman read the Committee's Orders of Reference dated March 30, 1966. He then announced the names of the Members who have been designated to act with him on the *Subcommittee on Agenda and Procedure*, namely Messrs. Forest, Brewin, Wahn and Woolliams. He added that Mr. Brewin will be replaced since he is no longer a member of the Committee.

The Chairman then presented the *First Report of the Subcommittee* as follows:

The Subcommittee on Agenda and Procedure recommends:

1. That the Committee meet twice a week, on Thursdays and Fridays at 9:30 a.m., subject to the approval of the Coordinator of Committees.

2. That the Committee hold its next meeting on Thursday, April 21.

3. That the Committee proceed to hear:

- (a) Mr. Forest on Bill C-118; and Mr. Mather on Bill C-87 and on Notice of Motion No. 26 under his name;

- (b) Mr. Southam on Bill C-26 and Mr. Wahn on Bill C-49.

4. That the Committee print 750 copies in English and 500 copies in French of its Minutes of Proceedings and Evidence.

On motion of Mr. Bell (*Carleton*), seconded by Mr. Chrétien,
Resolved,—That the First Report of the Subcommittee on Agenda and Procedure presented this day be adopted.

The Committee proceeded to the consideration of the subject-matter of
Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).

Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).

Bill C-87, An Act to amend the Criminal Code (Impaired Driving).

Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and

of Private Members' Notices of Motions Nos. 26 and 31, which read as follows:

No. 26—"That, in the opinion of this House, the government should consider early action to provide or promote legislation having as its aim the inclusion, at the manufacturer's level, of new and effective safety features in motor vehicles produced in or imported into Canada."

No. 31—"That, in the opinion of this House, the government should, as soon as possible, create a Commission or Committee to enquire into the manufacturing of safer motor vehicles and that, subsequently, on production of the report of such Commission or Committee, it should take immediate steps towards the implementation thereof in order to assure that all scientifically proven safety features are incorporated on vehicles produced or imported for use in Canada and in order to halt the senseless and unnecessary slaughter of thousands of Canadians each year on our highways."

The Chairman invited Mr. Forest to explain Bill C-118. Following his remarks, Mr. Forest was questioned.

After discussion, Mr. Scott (*Danforth*) moved, seconded by Mr. MacEwan,

That a copy of Bill C-118 together with a copy of the Minutes of today's Proceedings be forwarded to the Attorneys General of the Provinces and the Attorneys General of the Yukon and the Northwest Territories with a request that they let the Committee have their views upon same.

The motion was adopted on the following division: Yeas—9; Nays—1; Abstentions—3.

At 12.10 p.m. on motion of Mr. Nielsen, seconded by Mr. Bell (*Carleton*), the Committee adjourned to the call of the Chair.

Fernand Despatie,
Clerk of the Committee ad hoc.

EVIDENCE

THURSDAY, April 21, 1966.

(Recorded by Electronic Apparatus)

● (11.10 a.m.)

The CHAIRMAN: We now have a quorum, as early in the morning as we have got it. The order of reference, gentlemen, is dated the 30th day of March of this year. It reads:

Ordered—That the subject-matter of the following Private Members' Bills, be referred to the Standing Committee on Justice and Legal Affairs.

Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).

Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).

Bill C-87, An Act to amend the Criminal Code (Impaired Driving).

Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles).

It was also ordered:

That the subject-matter of Private Members' Notices of Motions Nos. 26 and 31, be referred to the Standing Committee on Justice and Legal Affairs.

The members of the steering committee as selected in conjunction with the whips of the respective parties are as follows: Myself as Chairman, Mr. Forest, Mr. Brewin, Mr. Wahn and Mr. Woolliams. Mr. Brewin, I take it, will have to be replaced because he is no longer a member of the Committee and Mr. Mather has been appointed in his place; we also have Mr. Scott here this morning who is taking the place of Mr. David Lewis.

The steering committee met and I will read their recommendations. The steering committee recommends:

1. That the Committee meet twice a week on Thursdays and Fridays at 9.30 a.m., subject to the approval of the co-ordinator of committees.

2. That the Committee hold its next meeting on Thursday, April 21.

3. That the Committee proceed to hear: (a) Mr. Forest on Bill C-118, Mr. Mather on Bill C-87 and on Notice of Motion 26 under his name. (b) Mr. Southam on Bill C-26 and Mr. Wahn on Bill C-49.

4. That the Committee print 750 copies in English and 500 copies in French of its Minutes of Proceedings and Evidence.

May I have a motion for the adoption of the report of the steering committee?

Mr. BELL (Carleton): I so move.

Moved by Mr. Bell, seconded by Mr. Chrétien.

Mr. CHRÉTIEN: I second the motion.

Motion agreed to.

The CHAIRMAN: Mr. Forest, we will be very glad to hear from you an explanation of your Bill C-118.

Mr. AIKEN: Mr. Chairman, I wonder if I might ask for a clarification, do we intend to clear up one subject before proceeding to another. I particularly refer to Bill C-118. It is rather a simple bill. The others are rather tied together. Are we going to have a general discussion of all these matters at once, or are we going to try to finish this bill of Mr. Forest's before going on to another group of subjects?

The CHAIRMAN: I have given that the consideration that it is entitled to, Mr. Aiken. The clerk is just directing to my attention to the fact that Bill C-49 relates to dangerous motor vehicles which is relevant to Mr. Forest's bill. My own thought on the matter would be that it would be well to hear Mr. Forest and let him make himself available for questions and explanations of his bill and then reserve our decision on what we want to recommend as to the subject matter of the bill. But that, of course, is in the hands of the Committee.

Mr. AIKEN: Mr. Chairman, I do not think that any of the other bills relate to Bill C-118, which is a very simple matter. It merely relates to the onus of the owner of the motor vehicle involved in a collision and leaving it. I do not think it relates to any of the other matters.

The CHAIRMAN: Well, it is up to the Committee to decide. I can see no reason why we should not deal with it and settle it now, if the Committee can come to an agreement on what they want to do about it.

Mr. SCOTT (*Danforth*): In looking over the bills, I agree with Mr. Aiken that Bill C-118 does not really touch the big subject into which we are heading, which is the full problem of automobile safety in Canada, which is quickly becoming one of the major issues in North America. I was wondering what the view of the Chair was; perhaps I should reserve comments until after you have dealt with Bill C-118. It seems to me that the subject matter is so wide and so important that just hearing the sponsors of the bill is not going to get anywhere near catching the real essence of the problem with which we are faced. If the steering committee has not considered that, maybe I can reserve my remarks until after Bill C-118 has been dealt with.

The CHAIRMAN: As you say, it is a very big subject. The question of safety appliances and the law in relation to them in the manufacture of automobiles is a very wide subject. Just how far we should get into them as a Committee I do not know. There have been a lot of hearings going on in different parts of Canada. I notice in the *Globe and Mail* this morning that the government have some plan regarding safety factors in their automobiles, and I am sure Mr. Grafftey, Mr. Mather and the other witnesses will have a lot to say about it. Just how far are we going to go in the matter? We can go into the safety appliances on automobiles and the law to be applied to manufacturers who fail to instal such appliances.

You are opening up a very, very big subject, and I think the steering committee should consider it and decide just what they recommend to the Committee as a whole to do.

Mr. SCOTT (*Danforth*): I would hope that yourself and the Committee would take as wide a view as possible of the activities of the Committee itself in this area; because it is important and it is something that we are going to have to look into pretty thoroughly and come up with some recommendations, notwithstanding the fact that the press release you have referred to seems to indicate that the government is going to go ahead on its own hook even while we are meeting.

The CHAIRMAN: That applied only so far as I read, the press release, to motor vehicles owned by the government. It was not a general application, although other people might follow it.

Mr. SCOTT (*Danforth*): And so interpret the report; but we can comment on it later.

The CHAIRMAN: Are there any further comments on this matter we are discussing?

Mr. FOREST: Bill C-87 is the same; it does not concern safety of motor vehicles; it is impaired driving, blood count, and Bill C-118 is the same. It does not concern, the general matters; the other bills concerns safety in motor vehicles.

The CHAIRMAN: Well, I think, Mr. Forest, we will just deal with yours now, if you will tell the Committee what you would like to say about it.

Mr. FOREST: Mr. Chairman, gentlemen, Bill C-118 is not very complicated, it is quite simple. It proposes an amendment to Section 221 of the Criminal Code, paragraph 2, which deals with what we generally call hit and run cases. Its purpose is to strengthen the law and to remove what I would call the inadequacy of the existing legislation to deal with the appalling and growing number of hit and run cases in recent years.

I have no exact statistics right now to give to you; I put a question on the order paper a few weeks ago, in March, asking for the number of such offences in Canada, in the Province of Quebec, et cetera, and the number of persons that were killed or injured during such accidents, and the average number of sentences in relation to the total number of such accidents during the period of 1960 to date. I have had no reply up to now. The information I have indicates that in the city of Montreal alone, during 1964, there were over 4,000 hit and run cases that were reported to the police and prosecutions could be taken only in about 700 cases owing to the difficulty of identifying the guilty persons.

I think in your own experience, and mine also, as a lawyer, we have had quite a few of these cases and we are aware of the evil done, the misery of the victims who have often been left, and the difficulty of presenting evidence against the guilty motorist.

In recent years, as far as civil damages are concerned, especially in the provinces of Quebec and Ontario where they have the Unsatisfied Judgment Fund, and in the province of Quebec the Motor Vehicle Victim Indemnity Fund,

it has not been so bad, since they can claim most of their damages, but I do not think that this applies all through Canada, nor have all the provinces such provisions in their statutes.

At any rate, I do not think it is sufficient reason, to let the guilty person go unpunished, or scot free. As the law stands now, there can be no action taken against the driver unless he can be positively identified as the driver of the vehicle at the time of the mishap. This may happen, and even if, for example, an eye-witness, or a person saw the incident take place and reported the registration number of the car, it is not sufficient.

The terms of this amendment as drafted may not be quite satisfactory. My own amendment was not quite like this, but after discussion with Dr. Ollivier, the Law Clerk, he suggested that it be drafted this way. In the first part it provided that in any case where it has not already been established who has the care, charge, or control of such vehicle, we should add the person who is registered as the owner. He added that proviso which I thought was not necessary. Naturally if the Crown knows who it is, they will sue the person; otherwise they could sue the owner of the vehicle and then there would be a presumption that could be rebutted, what we call a *juris tantum* presumption that could be rebutted by the owner of the vehicle.

Maybe the eminent lawyers of this Committee would have a better suggestion of how exactly to draft this amendment to render this section of the Criminal Code more binding and more effective in order to have a better chance of convicting those guilty persons.

I am personally convinced that if the Criminal Code were amended to make the ownership *prima facie* evidence that this person had the care, charge or control of the vehicle, the work of the police would be much more effective.

Now, the question that it raises is—

Mr. AIKEN: I do not like to interrupt, but the one point that I do not like about the bill is the use of the word deemed. Now you have just finished using the words *prima facie* evidence and there is a good deal of difference. I wonder if you could explain it.

Mr. FOREST: *Prima facie* would be going a bit too far. It is just to create a simple presumption, we deem, that can be rebutted by the owner of the vehicle. This is the question: would it impose undue hardship on the owner in such cases? I think this is what we have to worry about.

Mr. BELL (Carleton): It is not, with respect, what the bill says. If the bill simply created a presumption, I think we could go along with it. But this creates an absolute obligation which the owner has no power to overcome.

Mr. FOREST: But suppose he were sued, he could naturally rebut the presumption.

Mr. BELL (Carleton): He is not under this draft; I think that is the problem.

Mr. NIELSEN: The bill says shall be presumed to have been.

Mr. FOREST: The intention was to create the simple presumption. That is the way I understood Dr. Ollivier. In this way it would create a simple presumption. Maybe you are not of the same opinion. Perhaps we could change

the words to go not quite so far as this intends to, or seems to be construed. But the intention is to create a simple presumption against the owner who could rebut it. Generally he is the driver of the vehicle, but if he was not driving it at the time of the accident, he could always produce witnesses, or even one witness for his own evidence, and the case would be dismissed. For example, even if his car were stolen, he would naturally have reported it to the police, and presumably there would be no charge. Or if he had lent it to somebody, he could always give the name of the person who had the car at the time of the incident. The way it is supposed to be construed it would be an easy rebuttable presumption. Maybe the terms go a bit too far; maybe we could change that if the Committee is of the opinion that we are creating a too strict presumption against the owner. We do not wish to put him in an awkward position, or to cause undue hardship to the owner because that might be one weakness of this bill.

Mr. BELL (*Carleton*): I am sympathetic with the explanation, but very unsympathetic with the draft of the bill.

Mr. FOREST: I thought maybe the lawyers of this Committee could improve on the amendment, but the intention of the bill is to deal with those growing numbers of cases; my opinion is that the innocent motorist would be protected and the victim would be the guilty motorist who does not care to stop or to render assistance after causing an accident or hitting a person on the road. This is the purpose of the bill. At the moment it goes too far, but I think there is some inadequacy in the law which results from the fact that most people go scot free after having caused a hit and run accident. This would strengthen or remedy the inadequacy of the existing legislation.

Now, I am quite ready to accept another drafting, as Mr. Bell has suggested, to render this presumption more easily rebuttable.

Mr. LAFLAMME: Mr. Forest, is it not a fact that when there is an accident, when they do not know who was driving the car, policemen go after the owner first? In fact, it does not change it at all. But I really think that it is a matter for the Criminal Code, not civil rights and I really think it is quite hard to put on anyone the presumption of being responsible for an accident. I think this principle goes very far. It is quite hard enough to defend when there is a charge made against anyone; the police do their work, but I do not see what is the purpose of the bill, to aid the presumption of a criminal offence? What is the purpose?

Mr. FOREST: But the Crown, the police have to prove who had the care, charge, and control of a vehicle. If the driver has disappeared, they have no proof, usually, at all. This would force the owner to reveal who was driving at the time.

(*Translation*)

Mr. CHOQUETTE: They are presumed innocent, not presumed guilty.

(*English*)

Mr. OTTO: Mr. Chairman, I am rather amazed that Mr. Forest does not consider what we are doing here. First, to rebut even a presumption is a very expensive business. In other words, you are putting an individual who happens

to own a car to two tests; first, to provide an alibi and to prove his innocence and to pay a fantastic amount of money these days to prove himself innocent. The onus, now, you are putting on the people instead of on law or on the law enforcement agencies. Consider also that the police are like other individuals; if there is an easier road, they will take it, and if it is quite easy to find someone who owns a vehicle who does not have an alibi, to charge him and let him prove, let him find the guilty party. If you are talking about statistics, I am sure if you compare the statistics of the number of vehicles stolen to the number of accidents where they cannot find the guilty party, you will find that a fantastic number of vehicles are stolen and a good portion of those incidents will wind up with the owner having to prove himself innocent.

Mr. FOREST: In such a case like the owner usually reports his car stolen. Naturally, then, he would not be charged at all.

Mr. CHOQUETTE: It happens at times that some people, some kids take the car from the owner, then they take it back and the owner did not even know about it.

Mr. FOREST: I admit, Mr. Otto, it would impose some burden on the owner to prove his innocence rather than having the Crown prove him guilty, but it is due to the difficulty of these hit and run cases.

● (11.30 a.m.)

Mr. MACEWAN: Under this proposed amendment an immediate charge could be laid, an information laid against the owner of the car; I do not think that is fair at all.

Mr. FOREST: Naturally you have to rely on some good faith on the part of the Crown. If they know who it is they will charge the guilty person but—

Mr. MACEWAN: —sometimes the Crown is reasonable and sometimes it is not.

Mr. SCOTT (*Danforth*): I just have a few objections and maybe the witness will satisfy them. I think one of them has already been made, namely, that what you are suggesting, and I am sure you do not mean it, is you are seeking to reverse the whole basic philosophy of the Criminal Code which is that an accused is presumed innocent and that the onus to prove him guilty beyond a reasonable doubt is on the Crown and never shifts throughout the trial.

What you are doing by this bill is really reversing it and I think you do not want to do this; but it certainly is a very dangerous principle because, as Mr. Otto has pointed out, the difficulty of reversing an onus, once it is erected certainly by statute, would be very very hard.

The other thing is, have you given any consideration to the real ingredient of the offence? The real ingredient of the offence is not leaving the scene, or being in control, but leaving it with the intent to escape civil or criminal liability. This is the real ingredient of the offence under this new section of the Code and it is in the difficulty of proving this that a lot of the trouble arises in getting convictions. Have you given any consideration, whether some amendments might be necessary?

Thirdly, if you are going to even erect a slight presumption, it seems to me you have to write into it very very carefully all that is required to reverse the

presumption, because it should not have to be very much under the Code. I think it is a very dangerous principle you are suggesting, although I realize you are not putting it forward in that way but that certainly is how the bill reads.

Mr. AIKEN: I would like to make a couple of comments. We do not have it here, but is there not another presumption in this section in connection with the very matter that Mr. Scott raised, namely, the intent of escape civil or criminal liability. It seems to me that that presumption in a subsequent subclause is raised against the accused; that if he does leave, it is presumed he left with an attempt to escape civil or criminal liability, unless he proves otherwise. So perhaps he has got two or three people.

Mr. FOREST: This is paragraph three: If he has left it is *prima facie* evidence that he had intention to leave. It would be hard to prove in any case, if he left, because he wanted to prevent civil or criminal responsibility but that is usually the main reason why people do not stop after an accident.

Mr. SCOTT (*Danforth*): Having defended some of these people, I know just how difficult it is to reverse that presumption which is erected by statute. If you now go further and raise another presumption against the accused, I think it is hopeless.

Mr. OTTO: Well, Mr. Forest there is just one other thing I would like to add, I can see your sense of injustice here, but you will recall, or some of the lawyers will, that motor vehicle accidents, or negligence in regard thereto, are not classed by some very famous decisions as the equivalent of a criminal act, In other words, there is the principle involved that when a person takes to the highway, he must give up some of the right, some of the securities that he would normally have, and he takes on himself a certain amount of risk by just the very fact of using the highways and using motor cars. So I can see your anxiety to cure an injustice where some people have negligently caused the loss of life and yet get away with it. But this is part of the whole principle of law that no one as yet has thrown out. There is a difference between criminal acts, according to our criminal law, and quasi-criminal acts on a highway.

Mr. FOREST: I understand. It is difficult to find an effective way with which to strengthen the hold as it is. This is one way, I thought of. I do not know if there would be another way to render it more effective but as it is, it is a fact that most people who are guilty of these offences go scot free. They never can be identified and the proof for the Crown, is difficult to secure even if they have taken his registration they cannot prove it against the driver, it is very difficult. Pardon?

Mr. LAFLAMME: The owner of the car in those circumstances, is liable for civil damages. It is just as hard for him.

I just would like to give a simple example of what could happen. Suppose I have a son and I lend the car to him. He goes to a party with two other friends of his. They get the car, they have an accident. They escape. The owner of the car will have to explain what happened during the night. I do not think we would assent to the principle of creating a presumption of convicting people by presumption in criminal offences. I just would like to know where this bill would go if it were passed. Would it improve the law? Would it improve

something? Or will it put on anyone the burden of defending himself and having a lot of trouble at the courts any time those circumstances occur, and if the owner of the car cannot find who was driving the car, he will be responsible? He will be convicted?

Mr. FOREST: Not necessarily. He could always present witnesses that he was somewhere else or that he was not driving the car.

Mr. CHOQUETTE: It is a principle of the Criminal Code.

Mr. FOREST: Well, that is what I said. What is worrying me is the balance of inconvenience to the owner, considering the advantage to improving the law. That is the main point.

Mr. NIELSEN: Mr. Chairman, Mr. Forest seems to be alone in his arguments here. I want to advance some on his side and I do so not with the intention howsoever of endorsing the principle that he is trying to establish through his bill. I simply advance these observations, hoping to stimulate further discussions. Presumptions in criminal law are not new. They are rare. There is, for instance, the presumption that Mr. Forest has already pointed out contained in sub-section three of the section which he seeks to amend, Section 21. There is also an even more familiar presumption which is an extremely difficult one to rebut in defence of accused persons, and that is the one relative to recent possession of stolen goods; so it is not entirely against the principles of Canadian justice that presumptions should be acceptable in the design of our criminal law.

Mr. LAFLAMME: Not only to finally convict someone but it is the consequences of a conviction by presumption in those circumstances because the action involves some other responsibilities, civil and other things which do not occur in the other cases where you say there are presumptions. It is not a simple fact, an accident.

Mr. NIELSEN: Well, let us leave for a moment the possibility of a presumption arising as to the attempt to escape civil liability, and just dealing with the criminal content of what Mr. Forest is trying to accomplish here. You can conceive of certain situations where it would not be unusual that a person would be in possession, for instance recent possession, of stolen goods quite innocently and yet be brought to liability.

Mr. OTTO: The chances are that if one is in possession of stolen goods, he has had something to do with it; whereas in this case I believe the probability is much further removed. Mind you, I do not agree with the original part of the code in connection with stolen goods but it is, and I think you will agree, something that is not a pleasant thing to defend oneself against and to add a further presumption will be just another nail in that same coffin, as one might say.

Mr. NIELSEN: Well, I merely have advanced some arguments on Mr. Forest's side, again not for the purpose of endorsing the principles he is trying to get across, but there is nothing, in essence, wrong mechanically with his suggestion. Whether or not it is an acceptable principle is quite another thing but the presumption that he is trying to create is certainly nothing new to criminal law.

Mr. BELL (*Carleton*). Oh, there are scores of presumptions of this type in the Code. I have in front of me the index to the Code showing in at least 20 cases that there are presumption of the type which Mr. Forest explained, not the type that is in the draftsmanship of the bill.

The CHAIRMAN: Well, in answer to certain comments, Mr. Forest indicated his willingness to change paragraph (b) by substituting the word, I take it, "presumed" for "deemed" and I was wondering if we wanted to discuss the principle on the basis of the words should be "shall then be presumed to be the person having had charged" and that, to a degree, eliminates some of the curse that is on it that we have been talking about. But it does not get right down to the principle of whether or not we want to recommend this.

Mr. BELL (*Carleton*) May I ask, Mr. Chairman, Mr. Forest whether he has discussed this matter with the director of the criminal law division of the Department of Justice or with the Attorney General of his own or any other province?

Mr. FOREST: I wrote to the Minister of Justice.

Mr. SCOTT (*Danforth*): Mr. Chairman, we should hear some of these people as to their experience with this section of the Code and what difficulties they have encountered, and any ideas they may have as to the way in which it could be safely strengthened.

Mr. BELL (*Carleton*): I would be quite interested in knowing what the views of the Attorneys General of the provinces were in a matter of this sort. Has there been a real problem encountered by the police and what suggestions would they have, if such a problem has been encountered, of meeting it.

Mr. MACEWAN: Was it discussed at the last federal-provincial conference on crime?

Mr. NIELSEN: Another question, too, that I would want to ask, Mr. Chairman, is whether the bill had gone through the mechanics of being cleared under the requirements in that regard with respect to its constitutionality, and so on.

Mr. FOREST: No. It was just presented because of my own experience in some similar cases and I know for a fact that there have been a rash of hit-and-run cases in the last few years. I know that there are very seldom convictions in these cases. It was introduced for the purpose of strengthening the law, though I was myself worried about the implication on the inconvenience and the awkward position it might put some owners, naturally and especially if the Crown was not prudent in laying charges.

The CHAIRMAN: What is in your mind, Mr. Nielsen, in regard to constitutionality? Is it property and civil rights that you have in mind, or what?

Mr. NIELSEN: No, no, there is a requirement that all private members bills submitted have to be vetted by the Minister of Justice for their correctness—

The CHAIRMAN: All I can say is that I wrote to the Minister of Justice and told him that these bills would be considered by the committee, and asked him

if he wanted to be represented either in person or by a member from his department. I have a letter this morning saying that they do not intend to appear. Whatever inference you can draw from that, I do not know.

Mr. SCOTT (*Danforth*): I presume you had no right to ask them to do so. I was wondering whether the committee would welcome the suggestion that the clerk send a text of the bill to the various Attorneys General and tell them we are looking at it and ask for comment and reply, and we might get some response that would be useful to us.

The CHAIRMAN: Is that a motion?

Mr. SCOTT (*Danforth*): I will make it a motion.

Mr. MATHER: I will second it.

The CHAIRMAN: You have all heard the motion that the Clerk of the Committee be asked to write to the various provincial Attorneys General asking for their comments on the principle in Mr. Forest's bill.

Mr. AIKEN: Mr. Chairman, may I speak to the motion. I think probably we should concern ourselves with whether or not—the committee intends to submit the identical wording that is here. It seems pretty general but if the committee feels that the proviso was too strong, that is the presumption, we may get nothing more back than the suggestion that the word “deemed” is too strong. Is the motion that we submit the bill exactly as drafted together with a copy of the minutes of these proceedings.

Mr. FOREST: I have no objection if you believe that the English term “shall then be deemed” as going too far. As explained in the note, it is only to create a simple presumption, I have no objection to substituting “shall then be presumed to having been the person having the care, charge, control of such vehicle,” if you think that is better.

Mr. SCOTT (*Danforth*): Yes, I think it is a good one that the minutes this morning indicate our qualms about the bill as it stands, and it might be useful if they were annexed to the bill when you send it out.

Mr. NIELSEN: Would you also include the Attorneys General for the Yukon Territories?

Mr. SCOTT (*Danforth*): I would be delighted to. We would not want to overlook them.

(Translation)

Mr. CANTIN: I have two remarks to make here. I think that the very principle of the Bill, I object to because of extending the presumption which might exist because whether we like it or not I was born in an area where, in Quebec perhaps we have the best laws in the world, we have the civil code, the Napoleonic code, and with the English Criminal Code, which has established the principle that any person or persons are innocent until proven guilty. Now secondly, I doubt of the very usefulness of a change in the law from a practical point of view solely and that is that if an accident like this occurs either we catch up with the vehicle or we don't. If we don't then of course no case can be

made. If we do catch up with the vehicle it seems to me that it is always easy then to establish who might have been the driver of that vehicle and therefore not just establish the presumption against the person who is registered as the owner. He can easily defend himself by saying that he was not there.

Mr. FOREST: It is precisely because we could catch those who were not identified in most cases that is to say, the owner could easily defend himself if he is not the one. He could then find the person who was driving the vehicle.

Mr. CANTIN: The Code as drafted does not prevent laying a complaint or any information against the owner of the vehicle. If there is no evidence as to the identity of the owner and he cannot be forced to give evidence, it would not be worthwhile for the Crown to proceed.

Mr. CHOQUETTE: The onus is then on the person who is in no way involved, this is what is implied here and that is unfair.

Mr. FOREST: I understand that this can go as far as that and cause inconveniences.

Mr. CHOQUETTE: My car might be at my door, there might be a young man who temporarily steals the car, goes and kills someone and then brings the car back. With fingerprints we can see that it was this particular car that killed the person but the owner would then be accused of criminal negligence.

Mr. FOREST: Of course if you reported the theft of the vehicle to the police, there would be no complaint. We have to have some good faith in the Crown which would not lay charges indiscriminately. But of course, if there is no identification, then the complaint would be laid against the owner to discover who was driving the vehicle.

Mr. CHOQUETTE: Are we discussing a motion, or what?

(English)

The CHAIRMAN: As I understand it, the Attorney General of the Yukon and the Attorneys General of the provinces, if the motion is passed, are to be advised of this particular bill and the change suggested is that the word "deemed" be changed to "presumed" and we ask for their comments on the principle of the bill. Now, is that the intent of the motion, Mr. Scott?

Mr. SCOTT (*Danforth*): The intent of the motion is that a copy of the bill as it stands, plus the minutes, will go to these officials. I am not too happy about putting in words about presumptions. I think the discussion makes clear our objections.

The CHAIRMAN: Any further comments?

Mr. CHRÉTIEN: Yes, Mr. Chairman, I oppose the motion because I am opposed to the principle involved here in the bill.

The CHAIRMAN: Maybe we are wasting time in writing to the Attorneys General, but on the other hand we may not. We may get back some very valuable information.

Mr. BELL (*Carleton*): We are not committing ourselves in any way by doing so, and when we send out the text of the minutes of the proceedings of today, the Attorneys General will see the reservations and the qualms which members of the committee have, and they will undoubtedly take that into consideration and, I think, will as well be prepared perhaps to suggest some alternatives. I think we want to know from them how serious is the problem in their provinces. If it is serious, then we should see whether there is some other technique of dealing with it, perhaps something quite different from what Mr. Forest has proposed.

Mr. NIELSEN: At most, it is a fine example of cooperative federalism.

Mr. FOREST: Well that is right. If there is an alternative, I would like to know it.

The CHAIRMAN: Mr. McQuaid, would you go over next door and see if you can get one more body in here because we are minus one for a quorum.

Mr. FOREST: That is what I would like to know, if there is an alternative. I have not thought of one but maybe somebody would have one.

Mr. LAFLAMME: I just would like to put in the record some presumptions which still exist in the Criminal Code actually and which are quite different from this one, in this new bill. Sub-section two of section 224 of the Criminal Code reads:

For the purpose of section 222 and 223, where a person occupies the seat ordinarily occupied by the driver of a motor vehicle he shall be deemed to have the care or control of the vehicle unless he establishes that he did not enter or mount the vehicle for the purpose of setting it in motion.

This is a presumption quite different from this one.

Mr. FOREST: That is the impaired driving section—224.

Mr. AIKEN: There is a technical problem. You have officially noted that we lack a quorum. I do not see how we can go ahead until we have one. Unfortunately it has been officially noted.

Mr. CHAIRMAN: No part of what we are doing now will be recorded in the minutes until we have a quorum back. It has only been in the last couple of minutes that we lack a quorum.

Mr. CHOQUETTE: How do you get a bill studied by the committee? How can we study that bill?

Mr. FOREST: You will remember the bill was referred by the house to this committee.

Mr. MACEWAN: Mr. Chairman, since the minutes of these proceedings are going to be sent to the Attorneys General, I wonder if we should not have some discussion on the words in the second line of subsection (b): "Provided that in any case where it has not already been established"—I am just wondering if these words should not be changed to "these cases where it cannot be established" rather than "where it has not been established". As they are set out

there, there might be a tendency for the Crown not to try to establish who was actually driving the car when all he has to do is charge the owner. I think if we change these words to "where it cannot be established" that would at least put a burden on the Crown to attempt to establish—

Mr. NIELSEN: I do not think they should be there at all.

Mr. CHAIRMAN: I think that Mr. Forest would agree with that change. I know that I would, simply as a member of the committee.

Mr. FOREST: There might then be a discussion then as to whether the Crown could or could not establish at the time what had happened.

Mr. AIKEN: The only thing I can feel for the argument is that the Crown may not make any reasonable effort to try to establish who the driver is when they can just say "well, we charge the owner".

Mr. SCOTT (*Danforth*): Lay an immediate charge against the owner.

Mr. AIKEN: That is right.

Mr. SCOTT (*Danforth*): That is what I would be afraid of.

● (12 noon)

Mr. AIKEN: Mr. Chairman, I am not too clear on how our proceedings are being recorded. When we talk about the minutes will this mean a summary of the remarks made or is it a transcript?

The CHAIRMAN: The minutes are being recorded, yes.

Mr. AIKEN: Good.

The CHAIRMAN: We have a motion moved by Mr. Scott and seconded by Mr. MacEwan that a copy of Bill C-118 together with a copy of the minutes of today's proceedings be forwarded to the Attorneys-General of the provinces and the Attorneys-General of the Yukon and the Northwest Territories, with a request that they let us have their views on the same. Those in favour of the motion please signify.

Mr. CHOQUETTE: Is this subject to debate?

The CHAIRMAN: Pardon. Well we have debated it. Mr. Mather and Mr. Stanbury do you have any further comments?

Mr. STANBURY: Mr. Chairman, I would like to add briefly that not having had the benefit of the discussion—I do not want to prolong it—I should like to know the reason behind it.

The CHAIRMAN: The reason behind it, I think, turned around the word "deemed" in clause B, whether that should not have been a lesser word such as "presumed", and also the question as to what onus we are putting on the owner of an automobile, by saying that he was presumed to have been the person who had the care, or charge, or control of the vehicle at the time of the incident. It was felt that it would be valuable to obtain the opinion of various Attorneys-General as to their thinking along those lines, and for that purpose a copy of the minutes be sent to them and also a copy of the bill.

Mr. NIELSEN: I think it is fair to say Mr. Chairman, that the committee has not committed itself to the principle or to the wording. All we are seeking is advice from the Attorneys-General to the extent of the problem and whether they have any advice to offer this committee.

Mr. CANTIN: It is our responsibility.

The CHAIRMAN: Are we ready for the motion now. All those in favour of the motion, please signify.

Motion agreed to.

The CHAIRMAN: Thank you very much. We will have to wait until we hear from the Attorneys-General now. Do you want to adjourn? Mr. Southam is here prepared to go on.

The Chair will entertain a motion that we adjourn. Moved by Mr. Nielsen and seconded by Mr. Bell.

Motion agreed.

Thank you very much gentlemen.

OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 2

TUESDAY, APRIL 26, 1966

Respecting the subject-matter of

- Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).
Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).
Bill C-87, An Act to amend the Criminal Code (Impaired Driving).
Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and
Private Members' Notices of Motions Numbers 26 and 31.

WITNESS:

Mr. Barry Mather, M.P., Sponsor of Bill C-87.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Goyer,	Mr. Otto,
Mr. Asselin	Mr. Honey,	Mr. Ryan,
(<i>Charlevoix</i>),	Mr. Laflamme,	Mr. Scott (<i>Danforth</i>),
Mr. Bell (<i>Carleton</i>),	Mr. Langlois (<i>Mégantic</i>),	Mr. Stanbury,
Mr. Cantin,	Mr. MacEwan,	Mr. Trudeau,
Mr. Choquette,	Mr. Mather,	Mr. Wahn,
Mr. Chrétien,	Mr. McQuaid,	Mr. Woolliams—(24).
Mr. Fulton,	Mr. Nielsen,	

(Quorum 13)

Gabrielle Savard,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

TUESDAY, April 26, 1966.

(3)

The Standing Committee on Justice and Legal Affairs met at 11:30 a.m. this day. The Chairman, Mr. A. J. P. Cameron, presided.

Members present: Messrs. Bell (*Carleton*), Cameron (*High Park*), Cantin, Goyer, Laflamme, MacEwan, Mather, Nielsen, Ryan, Scott (*Danforth*), Stanbury, Trudeau, Woolliams (13).

In attendance: Mr. Barry Mather, M.P., sponsor of Bill C-87, An Act to amend the Criminal Code (Impaired Driving); also Mr. Gérald Beaudoin, Assistant Law Clerk.

The Chairman announced that Mr. Mather would replace Mr. Brewin on the Subcommittee on Agenda and Procedure.

On Motion of Mr. Bell, seconded by Mr. Laflamme,

Resolved,—That the Committee recommend to the House that its quorum be reduced from 13 to 10 members.

The Chairman invited Mr. Mather to explain Bill C-87.

Following his statement, Mr. Mather was questioned and a discussion took place. Mr. Scott registered his objection to the breathalyzer test.

Mr. Nielsen moved, seconded by Mr. Scott (*Danforth*),

That the Steering Subcommittee, based upon the views expressed by members today, call such expert testimony to be given to the Committee—at a time at which the Steering Subcommittee may advise—including expert testimony on the mechanical means by which the various tests are applied.

Carried on division.

At 12:30 p.m. the Committee adjourned to the call of the Chair.

Gabrielle Savard,
Clerk of the Committee.

EVIDENCE

Recorded by Electronic Apparatus

TUESDAY, April 26, 1966.

● (11:25 a.m.)

The CHAIRMAN: Gentlemen, we have a quorum and I will call the meeting to order. I have one announcement to make. Mr. Brewin has been replaced on the Committee by Mr. Mather. Mr. Brewin was on the steering committee and, in consultation with the Whip of Mr. Mather's party, the New Democratic Party, he suggested that Mr. Mather replace Mr. Brewin on the steering committee. Is that agreeable?

Agreed.

Mr. BELL (*Carleton*): Before you go on with the agenda, Mr. Chairman, I wonder if we might consider the problem of a quorum? Perhaps it is because of my Irish background that I am superstitious about sitting around a table as one of 13 and, consequently, I would like to move that we request the House to reduce the quorum of the committee to 10.

Mr. SCOTT (*Danforth*): I second the motion.

The CHAIRMAN: Well you have heard the motion. May I say I was at the Public Accounts committee this morning and they had the same problem; they are presenting a report this afternoon to the House asking that their quorum be reduced to 10. I had in the back of my mind—and I do not know whether it is good strategy or bad—that we wait and see what happens to their report before we deal with ours, but if you would rather go ahead with it, it is quite all right with me.

Mr. SCOTT (*Danforth*): If the quorum for the House is 20 out of 265 I do not think it is unreasonable to ask for 10 out of 24.

The CHAIRMAN: Well, the matter is under discussion. Before I put this matter forward I would like to know all those who are in favour of submitting a report asking that we ask the House to give us leave to reduce the quorum to 10.

Motion agreed to unanimously.

Mr. SCOTT (*Danforth*): Mr. Chairman, may I raise a second point of order before we get on to the Bill this morning? Is the Chair in a position to advise members of the committee when it is anticipated we will get to the bills and the subject of automobile safety?

The CHAIRMAN: I was going to ask if the steering committee would meet after this meeting and discuss that.

Mr. SCOTT (*Danforth*): Because the Chair will understand there is a lot of preparation involved and I would like to have some idea when we will reach the subject.

The CHAIRMAN: Then I will present the report and I will ask for unanimous consent to have it dealt with by the House. If we do not get it, then, of course, it will go on the Order Paper for debate after 48 hours.

Mr. Mather, you have the floor, to explain your bill.

Mr. MATHER: I have prepared a statement in support of my bill but, first of all, I think the fact that a number of members of the House have agreed to have their bills and resolutions, all dealing with one aspect or another of traffic safety, come before this committee at once, is indicative of the concern over the growing toll of traffic accidents and the members are so well acquainted with that toll that I need only take a moment to put it on paper.

The latest figures show that a traffic death occurs in Canada every 100 minutes, one traffic injury is recorded in Canada every three and a half minutes. For every person killed in this way—and there were close to 5,000 killed last year in Canada—there are 30 persons injured and the total charge against our economy, as the result of all these casualties and property damages from traffic accidents, is estimated to be about \$600,000,000 a year. So this, in round figures, is the problem that we, in one bill or resolution or another concerning traffic safety, are seeking to grapple with.

As we know, there are various aspects to traffic safety; safety features in cars is one; better signing, uniform signing of traffic laws is another; driver training, and so on, and the Bill No. C-87 which I am presenting this morning or the subject matter of it, rather, deals particularly with the traffic problem caused by the drinking driver.

Estimates of the toll taken by that particular contributor to traffic carnage vary greatly but I think it would be safe to say that the drinking driver is held to be responsible or involved in some one third to one half of all the fatal traffic accidents in North America.

The purpose of the bill is to amend the Criminal Code in relation to the offence of driving while intoxicated and the offence known as impaired driving and also to recognize the breathalyzer test, carried out by properly trained technicians, as an accurate method of determining blood alcohol levels.

I will quote very briefly from the explanatory notes of the bill on this point:

In the present legislation two offences are provided for intoxication and impaired driving. Both are degrees of the same thing. Those expressions are not defined and most of the time the prosecutions are made under the charge of impaired driving.

It is suggested to retain only the offence of impaired driving.

Concurrent with that, we would also provide in this bill for a compulsory test, the breathalyzer test, and the refusal to provide such a sample when required by a law enforcement officer would constitute an offence. It is suggested that the penalty for this additional offence should be the same as for impaired driving, as any lesser penalty would be in the circumstances an inducement to refuse.

To protect the individual the law enforcement officer who requires that a sample of breath be provided must have reasonable and probable

grounds for believing that the accused has committed an offence and the refusal to provide the sample must be without cause.

It is suggested that the refusal to take a test or give a sample is not admissible in impaired driving proceedings and evidence of such refusal should be admissible only in support of a charge of refusing to give the sample.

Mr. Chairman, before you come to consideration of detailed proposals in the bill, I thought it might be useful for you to consider how many other countries and states now have similar legislation in effect. These countries, which I will now name, have mandatory tests of a similar nature to the one which this bill proposes: Belgium, Finland, Western Germany, Iceland, Luxembourg, New Zealand, Norway, Peru, South Africa, Sweden and Switzerland. In the United States this or similar legislation is mandatory in five of their states and implied consent is present in, I think, 12 or 14 other of their states. This implied consent law in the United States is a law which provides that if you drive an automobile on a public street you have implied that you have given your consent to a chemical test for alcohol if placed under arrest for a driving while intoxicated offence and refusal to take that test in those states results in a loss of the driving privilege for a specified period.

We know also that the province of Saskatchewan has legislation providing for suspension of the licence of a driver suspected of driving while under the influence of alcohol if that driver refuses to give a sample of his breath and this legislation has been ruled valid by the Supreme Court of Canada. I thought that that information might be useful in giving us perspective of the growth of acceptance of this kind of legislation which the bill proposes.

Now, Mr. Chairman, I think there are two major criticisms against mandatory breathalyzer tests. I would like to say something on each of those points. It is, for example, argued that there is an interference with the civil right in the making of a compulsory breathalyzer test. Might I quote from one or two authorities against that contention? This is what the Canada Highway Safety Council says on that point, and I quote:

Driving an automobile is a privilege accorded by provincial governments and it is not a right. Like any other privilege this one carries certain obligations such as obeying the laws of the province and the country; producing registration and operator's permit when required by the police to do so; submitting to a check of brakes or lights as required. It is the consensus in police circles that submitting to a breathalyzer test should be one of the obligations.

Further to that point, Mr. Chairman, quoting briefly on the statements by Mr. Justice E. L. Haines, he says:

Today a motorist must identify himself by producing his operators licence, produce evidence of ownership of the vehicle so that all may know it is not stolen, prove his financial responsibility, permit a mechanical inspection of the vehicle as to its fitness, report any accident involving personal injury or property damage over \$100, remain at the scene of an accident and offer assistance to the injured. These are all exceptions to the so called right to remain silent, and they were created

in the interest of public safety. Identity of the driver and owner, proof of financial responsibility, safety of the vehicle, these are secondary compared to the physical fitness of the driver. Why should not we take the step to ensure true disclosure of that fitness when it has been affected by alcohol? Our duty to ourselves, the potential victims of that driver, demands nothing less.

If one more brief quotation would be permitted under this heading, Mr. Chairman, I have one from a distinguished source. I quote the Leader of the official Opposition in this Parliament, Mr. Diefenbaker. At page 4401 of *Hansard* which, for the information of those who do not have that particular volume handy, is the *Hansard* of June 29th, 1950, Mr. Diefenbaker said:

I am not going into the chemical arguments now although I am in a position to do so. There are those who will say that it means some invasion of one's liberty. Looking at it from the point of view of one who, with few exceptions, has invariably been engaged on the defence side, my answer is that I do not believe any question of the liberties of the subject arises when a person who has been in an accident which was obviously due to his negligence, and who apparently is under the influence of liquor, is asked to breathe into a balloon with a view to determining once and for all the question whether or not the degree of his intoxication was such as made it dangerous for him to be on the highway.

From Mr. Diefenbaker. Mr. Chairman, to come to the other area of opposition to this type of proposed legislation is the argument advanced by some that impairment varies among humans to such a degree that one person, for example, who might have had four drinks may be less impaired than another person who might have had, say, two drinks. In answer to this argument I would quote again from the Canada Highway Safety Council and it says—and this is an organization, as we all know, which has given a great deal of impartial thought to such problems as this:

Since the accident hazard begins to rise with blood alcohol concentrations in the neighborhood of .05 per cent it is clear that the ability to drive safely is impaired before driving becomes noticeably erratic to police officers and long before universal agreement could be expected on a driver being intoxicated. Measures to reduce the number of motor vehicle accidents caused in whole or in part by alcohol must be related to the demonstrable hazard associated with alcohol rather than to a driver's state of impairment or intoxication as judged clinically. The assumption that a driver who is demonstrably impaired or intoxicated is unsafe to drive is valid. The converse assumption that a driver who is not so demonstrably impaired or intoxicated is safe to drive is not valid. The Canadian Medical Association, the American Medical Association, the British Medical Association and many other organizations competent to express an opinion have stated that the highest level of blood alcohol that can be regarded as entirely consistent with safe driving is .05 per cent. There is variation in the effect of alcohol from person to person and from time to time in the same person, but administrative measures to prevent persons driving when their ability to do so has been compromised by alcohol cannot be framed on an individual basis, for the same reason that

speed limits cannot be individually determined according to a driver's competence. Rules must be made which will apply to all members of the driving population equally, regardless of individual variation and tolerance to alcohol and based on the results of experience and experiment on average members of society.

Mr. Chairman, this pretty well concludes my presentation in support of my bill. I should say that it has the support of the Canada Highway Safety Council and has the support of the Committee of the Canadian Medical Association which is concerned with the relationship between drinking and driving.

Before I conclude, I would point out though, Mr. Chairman, that while I have been speaking, statistics on the average would indicate that 20 people have been injured, one person has been killed and something like \$75,000 of property damage has taken place during the presentation of this support for the bill. And a proportion of all that toll, of course, has to do with impairment.

Personally, I believe that it is time that our country moved with many other countries to protect the public's rights rather than to preserve the drinking driver's privileges.

The CHAIRMAN: Thank you very much, Mr. Mather, for your very interesting, very informative statement. The committee is now open to ask questions and express its opinion on the subject matter of your bill.

Mr. SCOTT (*Danforth*): First of all, I want to congratulate Mr. Mather on bringing forward this important matter. I wondered how and on what basis you arrived at the .08 per cent.

Mr. MATHER: I believe that the figure of .05 per cent is the generally accepted one as being the level where impairment begins. The .08 per cent would be that supported by some authorities, including, I believe, the Canadian Medical Association.

Mr. SCOTT (*Danforth*): There is a danger, then, that if we accepted this figure we would almost be legalizing impaired driving. My information is that every available study indicates that impairment begins at .04 per cent and, at .05 per cent, the degree of impairment is rising very rapidly. I just wondered why you wanted to extend it to an upper limit.

Mr. NIELSEN: Whose figure is the .08 per cent?

Mr. MATHER: I believe it is the Canadian Medical Association's figure.

Mr. WOOLLIAMS: If I might ask a supplementary question, Mr. Chairman, what does that spell in ounces of alcohol? I know it is going to vary but have you any idea?

Mr. NIELSEN: About two ounces, I would think.

Mr. SCOTT (*Danforth*): No, no, .05 per cent is three drinks of an ounce and a half each.

Mr. MATHER: That was my understanding.

Mr. NIELSEN: You say you think that the .08 per cent is that given by C.M.A. Do you know that it is?

Mr. MATHER: No, I cannot say definitely that I know but I know that my bill has the support of that group, the committee on this type of legislation, and they know that the bill calls for .08 per cent. If the members of the committee think that that is too high a figure, I would be happy in having the bill amended.

Mr. BELL (*Carleton*): Well, am I correct in understanding you, Mr. Mather, that you are saying that .08 is conclusive evidence but that other evidence could be given that there was impairment at a considerably lower content than .08 and a person would be convicted on that evidence.

Mr. MATHER: I agree.

Mr. SCOTT (*Danforth*): Mr. Chairman, I wanted, at some stage in our hearings to make a submission to the committee in opposition to the whole principle of breathalyzer and suggest an alternative. What would be the appropriate way to handle this?

The CHAIRMAN: I think you had better tell us what you have in mind.

Mr. SCOTT (*Danforth*): My main objection to the bill is the actual use of the breathalyzer itself. I think everybody in the committee is intensely worried about the whole problem of drinking driving and wants to get the best possible method of dealing with the problem. But my main objection is based on the growing belief, in the increasingly large body of evidence, that disputes both the accuracy and the reliability of the breathalyzer test itself and perhaps I could put some material on the record.

Numerous agencies in various countries have conducted tests into this aspect. Very extensive studies in the field have been carried out by one of the best known figures in the field of body metabolism, namely, Dr. I. M. Rabinowitch, who is a retired associate Professor of Medicine at McGill University.

Professor Rabinowitch argues that the breathalyzer accurately records the amount of alcohol in the breath but states that the breath is a very poor gauge of how much alcohol a person has actually consumed. He states examples in his studies where the amount of alcohol in the breath was as much as 250 per cent more than that in the blood. In some of his studies as high as 10 per cent of the cases have variations and he asserts that after a meal, for example, a man may have from 50 per cent to 300 per cent more alcohol in his breath than in his blood. As everyone on the committee is aware, the reliance of the breathalyzer is based upon the supposition that the amount of alcohol on the breath will be the same amount as that in a person's blood. If this is shown not to be so, the whole validity of the breathalyzer test can be called into question.

I might say I talked to Dr. Rabinowitch over the weekend at his home in Hamilton, Ontario, and I know that he is extremely interested in the bill and would be interested in testifying before the committee.

When we realise—most of us who defend impaired driving charges—that most courts will almost inevitably convict an accused when a breathalyzer reading of 1.5 is entered as evidence then, if Dr. Rabinowitch is correct, the dangers of this test are glaringly apparent. This would be all the more so if we legislated into law that a certain breathalyzer reading is, in fact, conclusive evidence of impaired driving. Dr. Rabinowitch in his evidence, Mr. Chairman,

asks us what would happen if 10 per cent of our fingerprint tests were inaccurate in our Criminal Code and yet, in the case of breathalizers, the courts are increasingly accepting this test as conclusive, and when tests which have been extensively canvassed all over the world indicate that it is inaccurate in up to 10 per cent of the cases. What we would be doing, it seems to me, would be erecting a very formidable legal structure on a very shaky medical foundation.

And it is perhaps not without significance that the Canadian Bar Association, at its convention last September, withdrew its support from the principle of compulsory breathalyzer tests and has ordered a year long study into the whole problem. I assure you this is not out of our desire to make it easier to get our clients off when they are charged with impaired driving, but is resulting from the growing feeling that the breathalyzer test itself is unreliable and unrealistic in the present circumstances.

What is happening, Mr. Chairman, and something the committee might be interested in taking into account, is the growing feeling among people that, rather than rely on this type of test, which is open to serious question, we legislate a new offence in effect under the act, of driving while not sober, and ruling that anybody who drives a motor vehicle where his alcoholic content is .05 is deemed to be not sober and the offence is then punishable. This would, it seems to me, remove a lot of the problems. First of all, it would remove all the stigma that goes with impaired driving and drunk driving. It would make it much more enforceable. For example, in Ontario 25 per cent of all the drunk driving charges are dismissed because they cannot really prove them and in Toronto up to 30 per cent. And there have been suggestions that we should think in terms of an absolute offence where a person, whose blood content or blood analysis shows him to have .05 per cent alcohol, is deemed to be not sober.

Mr. RYAN: How would you establish this?

Mr. SCOTT (*Danforth*): Well, in Norway, to which Mr. Mather referred today, they passed a law of this kind in 1926. The Norwegian Motor Vehicle Act defines anyone with .05 per cent alcohol in his bloodstream as "not sober" and then goes on to provide as follows:

Any person who operates a motor vehicle or is close to a motor vehicle he has just been using or is intending to start can be taken by the police for examination to a physician who will make a blood test, when it can reasonably be assumed that the operator is under the influence of liquor.

I might say that when I first looked at the bill I took the view that the mandatory nature of the test was an invasion of a person's rights and was almost a form of self-incrimination. But the more I looked into the problem and the more you realise the extreme seriousness of it, you realise that what you have to balance out is the right of a person to refuse a test as balanced against the right of the public to be protected against somebody who operates a motor vehicle when he is clearly not in a position so to do and I think that the public interest wins out. So that, under the Norwegian Act, a blood test is taken. The accused person can be taken before a physician who conducts a blood test which is accurate, and, on the basis of that, a charge can be laid. It seems to me that

under this arrangement you could have a graduated system of penalties. It could start with a fine and be progressively increased to suspension of licence for repeated offences, jail terms and, eventually, permanent suspension of the licence.

I just feel that the breathalyzer is an inaccurate method of handling the problem. All of the medical associations that have done tests, for example, state that .05 per cent constitutes three drinks of one and a half ounces each, taken within an hour of driving. Tests by Dr. Ward Smith, the Director of the Ontario Crime Laboratory, showed that at this figure responsibility for accidents rises sharply. A Swedish study shows the danger signs begin at .04 per cent. The American Medical Association says .05 per cent and Dr. Rabinowich who is one of the leading experts, claims .04 per cent is the correct figure. But somewhere in that general area is the danger point from the point of view of operating a motor vehicle and, rather than rely on tests, it seems to me we might consider something along this line.

MR. TRUDEAU: Could I ask, Mr. Scott, when you quote Dr. Rabinowich as saying there is a margin of error of 10 per cent does this mean that in 10 per cent of the times we have inaccurate results or does it mean that there is a 10 per cent difference between the point where the breath can incriminate one and the blood would not incriminate one?

MR. SCOTT (*Danforth*): Yes, in the article that I drew the material from, he was restricting his investigation to the relationship between the showing by a breathalyzer of the amount of alcohol on your breath as related to the true amount of alcohol in the blood stream, which is the only real test of impairment. And he found, in that case, there were variations of up to 10 per cent, which is a tremendous margin when you are dealing with the Criminal Code.

MR. TRUDEAU: A 10 per cent difference between the breath and the blood or a 10 per cent difference between the number of cases where you have accurate readings and non-accurate readings?

MR. SCOTT (*Danforth*): Ten per cent of the number of cases, I think. He said, for example, that if a man, say, has a meal at which he has a couple of drinks before, wine with it and a brandy afterwards, that he can have up to 300 per cent more alcohol on his breath than would show in his blood.

MR. RYAN: Mr. Scott, I take it that the variation is mainly with individuals.

MR. SCOTT (*Danforth*): Well, that is a second area; that is a second objection to the breathalyzer which I have not gone into, where, depending upon the time the alcohol is consumed, the person's physical make-up, his addiction to alcohol, his experience with drinking, all these can show quite a variation. But that deals, Mr. Ryan, with the effect of the limit itself. For example, at .05 per cent an inexperienced drinker could be completely intoxicated whereas a person who has been drinking over a long period of time and has built up a tolerance has a greater degree of control over the motor vehicle he is operating.

MR. RYAN: But the contents in the stomach make that a variation between the blood level and the breathalyzer level.

Mr. SCOTT (*Danforth*): I am told not really. It delays the transmission of the alcohol into the blood, but that is about its only effect.

Mr. MATHER: Mr. Chairman, if I could say a word on this, first of all I want to say I am very glad that my colleague has come around to the point of view that mandatory tests of one type or another are acceptable.

Mr. SCOTT (*Danforth*): You are very persuasive, in fact.

Mr. MATHER: Secondly, in connection with what he says about the questions raised by Dr. Rabinowich, it should be pointed out, I think, to the Committee that Dr. Rabinowich and the Canadian Medical Association differ very sharply in their findings or beliefs as to the efficiency of the breathalyzer test and also that his views are not those of an organization such as the British Medical Association.

However, as Mr. Scott has suggested, it might be interesting if the committee were willing to hear from the doctor and, if that were done, I would ask the committee if I might bring witnesses from the Canadian Medical Association. I think that most people would rather from the point of view of—I do not know how to say it exactly—violence done to the body or interference of civil liberties, accept the breathalyzer test than a blood sample test.

Mr. SCOTT (*Danforth*): Why? Why? What is the difference in terms of the invasion of privacy?

Mr. MATHER: Well, this is not my argument but this has been argued by people who oppose this type of test from the point of view of civil liberties. They think to take the blood test is an invasion of the body. This is not my view at all but I put it forward from the idea that I have that it would be easier for the public to accept the breathalyzer test.

Mr. TRUDEAU: I think you will find it is on a religious basis that some people have the conviction that you cannot draw blood but that you can draw breath.

Mr. MATHER: That is right.

Mr. RYAN: And, Mr. Chairman, in law, actually puncturing a vein to draw blood would be battery, I believe; whereas that taking of breath would not be battery but may be an assault, in the sense if it were forced, but I do not think it would be battery.

Mr. MATHER: My point of view was, as I think you can sense, that I would like to get some legislation through this parliament, eventually, which would provide for a mandatory test of drinking drivers. I put forward the breathalyzer test because I think that it has been found acceptable in many countries, many states. However, the principle of the bill is what we are discussing and, from my point of view, the principle is getting some action on a mandatory basis. If the committee were interested enough to hear the doctor or doctors I might call or suggest any other step that we might take, I would be very happy to co-operate with this basis.

Mr. TRUDEAU: I would think, Mr. Chairman, the interesting part in Mr. Mather's approach is that by using the .08 per cent figure he has provided for a margin or error. It might very well be possible to use this .08 per cent figure

and to say that if any accused wants to claim—I suppose this would require some slight amendment—that the .08 per cent in his breath did not correspond to, shall we say .04 per cent in his blood, then he would have the onus of having a blood test taken at his choice, if he so wished. But I think your approach, to me, appears to be the best one because it is the beginning of a stand by the legislature that anyone who takes a considerable amount of alcohol is in suspicion of the law and if he wants to prove in some way that he is not impaired, let him prove it. In Norway I think the legislation is that if you have taken any alcohol at all you are presumed to be guilty of impaired driving and people will not take so much as one drink if they are driving a car. They will have somebody else do their drinking or their driving.

The CHAIRMAN: Mr. Woolliams wanted to interject here too.

Mr. WOOLLIAMS: I have always taken the position to oppose these kind of tests but I may have an open mind—I hope I have—and I would like to hear evidence on it. I think that if we could hear the doctor or other witnesses it would be very good for the committee and would give us a greater appreciation of the problem which we are studying in reference to the bill. That would be a suggestion I make at this time.

Mr. RYAN: Mr. Chairman, as you very well know, there is a rule of law which states that the best evidence is what should be obtained, not the second best evidence, and therefore it would be better to have the evidence obtained directly from the venous blood stream rather than have this indirect evidence of the breathalyzer. But, against that, as Mr. Scott has pointed out, you have the necessity to commit assault and battery upon the person in order to get at the venous blood directly.

Now, I think that is part of the problem. Whether it is in the public interest that we can determine that there should be such a direct taking for the best possible evidence is what we will have to decide when we make our recommendations.

In respect to Dr. Rabinowich, it is some years now since I have been defending cases of this kind but I remember, going back a few years, that a man was considered impaired if he had 1.5 parts per thousand in his bloodstream. At that time I believe .02 per cent was regarded as the equivalent of roughly one ounce of alcohol and that if a man—the ordinary average individual—had about half a mickey in his system, or the equivalent of it in alcohol, he was deemed to be impaired.

Now, that is a considerably higher point than the .08 per cent that we are considering today. I believe that there has been an improvement in scientific techniques and understandings of this problem, in fact there is now recommended a drastic reduction in the level that scientists consider make the average individual impaired.

But I would be very anxious—and personally, I think it would be in the interests of the committee—to hear Dr. Rabinowich's evidence. Today, he may have amended his views considerably over the years or he may not have. I think his evidence would be relevant to what Mr. Scott has had to say earlier I would also like to see that the committee have before it the witnesses that Mr.

Mather suggested and I think we can get more precise details and know better where we are going after we have had the assistance of such witnesses.

Mr. BELL (*Carleton*): I would like to say that I would not be ready, personally, to make up my mind on this without hearing professional evidence. I think that evidence should be medical evidence and I think there should also be legal evidence. I would like to suggest that the steering committee take into consideration which of these are the best qualified persons and arrange to have them attend before the committee.

I do know that a committee of the Canadian Bar Association headed by its past President, Hazen Hansard, has given this very detailed study and I believe has made a presentation to the government on the subject. I think the steering committee should communicate with the Secretary of the Canadian Bar Association, Mr. Merriam, find out exactly what the status is and who might attend from that association to represent such consensus of views, if any, as the committee has been able to achieve.

Mr. SCOTT (*Danforth*): The other suggestion I wanted the committee to consider—and I make it hesitantly—is this; I have always wondered if it would not be beneficial to see a controlled test in this area and I wonder if the steering committee would consider consulting, for example, with the police for the obtaining of a representative group of citizens so that a scientifically controlled test could be conducted on the various levels at which a person's ability is impaired.

Mr. NIELSEN: I would like to volunteer for that, Mr. Scott.

Mr. SCOTT (*Danforth*): I was going to suggest that the committee be the subject but I thought it would get unfavourable publicity. But I think, if we are really going to get into the area of trying to fix a limit for impairment, it would seem valuable to seriously consider a scientifically conducted test on a group of people by giving them drinks at intervals in the presence of experts and then testing their ability to drive, so that we could try to establish some proper limit for operating a motor vehicle. I am not suggesting the Committee be the subject, but I think a group of volunteer citizens could be selected.

Mr. WOOLLIAMS: I think, Mr. Chairman, you had better clear with the Temperance League.

Mr. MATHER: I think it would be very appropriate for the steering committee, in view of the fact that we are dealing with this type of legislation, to take such a test.

Mr. RYAN: It would not steer straight afterwards.

(*Translation*)

Mr. LAFLAMME: Mr. Chairman, I have considered this and personally I do not think that at the present time any Committee member is in a position to make a decision on the necessity of establishing a compulsory test, either a breathalyzer or a blood test. I think that we should hear the views of experts in order to determine which one of the tests, either the blood or the breathalyzer test should be applied and which can provide conclusive evidence. So I would

respectfully suggest that as far as I am concerned—I have had some experience in the courts—any medical proof in this field would be assessed on an individual's capacity. For instance, if it were .04, somebody may be quite intoxicated, but somebody else may not be intoxicated with the same amount, it depends on individual's driving capacity at a given time, and therefore I would suggest that this is relative to the individual. And if ever in this world we were to introduce a maximum figure which would be recognized as conclusive evidence, then it should be a maximum of the overall individuals, and not on the average individuals. On this point, after having heard the evidence I personally think if we can reach any specific conclusions on such and such an alcohol level in the blood, evidence which would be valid for any individual, if we find that this is truly conclusive evidence, then I would agree that we establish a given standard. Now as regards to the principle of a compulsory examination, if the present one doesn't agree, we would have to choose one which would give the most conclusive results.

Mr. GOYER: Mr. Chairman, it is quite certain that evidence will be brought before our courts in order to determine if their driving is rather curious at times. Policemen can say that this is evidence. Somebody is staggering, he can't speak, his eyes are glazed etc. Scientifically this may also be just a matter of physical fitness and might lead us to false conclusions. Now on the contrary we say that in 30 per cent of the cases in Toronto it was not possible to determine that the person was actually guilty of impaired driving. In many cases, it was proved that these people were not truly impaired, perhaps because sufficient evidence wasn't available on those 30 per cent—I don't know. In many cases, we cannot prove it. And then we say that the margin of error is 10 per cent, well, there, I am a little afraid. That margin of error might lead us perhaps to convicting someone who is not really guilty, so whether it is a breathalyzer test or a blood test is not really material. The evidence that comes before our courts very often is quite hazardous and not safe at all. There may be many innocent people who have been convicted and vice versa, by these means.

Mr. TRUDEAU: Well, I must say that depends on the type of offence. It may be an offence in itself to drive when one has a certain percentage of alcohol on one's breath and if it is statistically determined that many accidents are caused by those who have imbibed too much alcohol, it is not at all unthinkable that a presumption of guilt be based on that very fact—the fact that one person has imbibed a considerable amount of alcohol. I had therefore, proposed previously that we should consider the possibility of making an offence out of this very fact that is the fact that a person who has imbibed a great deal of alcohol has been guilty of an offence. We could then require the person who claims that alcohol does not affect him at all to establish that fact.

Mr. SCOTT (*Danforth*): How would he do that though?

Mr. TRUDEAU: Well, if he wants to prove that what is on his breath does not really correspond with what is in his blood, let him go out and have a blood test. Or let him demand that the police take a blood test and show that, physiologically speaking, his brain has not got the amount of alcohol which impairs him.

Mr. BELL (*Carleton*): By the time the issue arises, he will have sobered up.

Mr. NIELSEN: He will still be capable of instructing counsel.

Mr. TRUDEAU: Yes, but the whole issue and the whole point I am trying to make with Mr. Goyer is that if we do find that driving after taking alcohol is one of the very large causes of accidents, then it is not inconceivable that we make it a crime or an offence or at least a presumption of an offence, to have a certain percentage of alcohol on your breath.

It may be that that is the necessary test to tell citizens in general that the framework of society says that you should not drive a car if you have had more than two ounces or one ounce and, if you do so, you are in a difficult position.

Mr. SCOTT (*Danforth*): I was not objecting to that, but I agree with you that we should legislate that a certain percentage of alcohol in your blood is the offence. What I was curious about is you went on then to say it would be up to an accused to rebut it by some sort of blood test of his own. I was curious about the mechanics of it. If you are in jail and it is late at night, where do you get a doctor?

Mr. TRUDEAU: How do you do it under your own blood test?

Mr. SCOTT (*Danforth*): At the present time the only real defence is: do not take the breathalyzer.

Mr. TRUDEAU: Then you are suggesting replacing the breathalyzer by a blood test.

Mr. SCOTT (*Danforth*): I was not proposing the second alternative; I merely said that every bit of medical evidence shows that at .05 per cent the person's ability to operate is impaired and the danger of accidents is rising rapidly.

Mr. TRUDEAU: I see, but you are not proposing that second alternative?

Mr. SCOTT (*Danforth*): I was not proposing the second alternative and to get away from the whole stigma that goes with it I was not proposing it to be called impaired or drunk driving, merely that that is an offence in itself.

Mr. TRUDEAU: I thought you had said that you had been convinced of something said by Mr. Mather. What was it?

Mr. SCOTT (*Danforth*): That was the compulsory aspect of it. At first I was opposed to the compulsory testing but the more I looked into it and saw the ratio of accidents the more I felt we had to balance out the right of the individual as against the right of the community.

Mr. TRUDEAU: What compulsory testing are you prepared to accept?

Mr. SCOTT (*Danforth*): The compulsory test that is done in Sweden where, if an officer has reasonable grounds for thinking the person is not sober, he can take him before a physician and a blood test can then be conducted, and that, I am given to understand, is the only accurate measure as opposed to the breathalyzer.

Mr. TRUDEAU: Then you are going a step further than, it seems to me, I was. I say use the breathalyzer as the compulsory test and if, as a citizen, you want to have greater guarantees, it is your responsibility to say, "Well, I want more than a breathalyzer I want a blood test."

Mr. SCOTT (*Danforth*): My objection to your proposal would be that you are putting into law what I think is demonstrably an unsafe and unreliable test and this is the real danger in legislating the breathalyzer at all.

Mr. TRUDEAU: Well, excuse me, it is unreliable, according to Dr. Rabinowich's figures, in showing whether you are impaired or not. It is not unreliable as to whether you have taken alcohol in a certain percentage or not.

Mr. SCOTT (*Danforth*): Oh yes, but the principle of the breathalyzer, Mr. Trudeau, is based on an assumption that the amount of alcohol on your breath accurately reflects the amount of alcohol in your blood and, if this is not true, and we do not know this at the moment, then surely it is very dangerous to legislate into the Criminal Code an unreliable form of evidence.

That is my main submission to the committee and that is why I am glad to hear the response that experts should be called to really investigate because the breathalyzer test has been the subject of growing controversy among the legal profession for years.

Mr. NIELSEN: Mr. Chairman, I have to be at another meeting at 12.30. I am going to destroy your quorum if I go. May I move that the steering committee take under consideration the remarks of the various members with respect to the calling of expert testimony and call such expert testimony for a session of the committee, to be set at the advice of the steering committee.

Mr. SCOTT (*Danforth*): I will second that.

The CHAIRMAN: Is that a motion?

Mr. NIELSEN: Yes, I made a motion.

The CHAIRMAN: What is the motion, then, Mr. Nielsen?

Mr. NIELSEN: That the steering committee, based upon the views expressed by members today, call such expert testimony to be given to the Committee—at a time at which the steering committee may advise—including expert testimony on the mechanical means by which the various tests are applied.

The CHAIRMAN: Is there a seconder for the motion?

Mr. SCOTT (*Danforth*): I second it.

The CHAIRMAN: Mr. Scott, is there any discussion?

Mr. SCOTT (*Danforth*): No, except I would hope that members would give to the steering committee their suggestions of appropriate witnesses.

Mr. BELL (*Carleton*): I would just like to add, Mr. Chairman, that I would be very interested in seeing the legislation in countries that Mr. Mather mentioned this morning, some of them, in particular, where we would pay special attention, like Belgium, Norway, New Zealand and the five states you mentioned of the United States. I think if we could have the text of legislation before us in a memorandum, it would be most helpful.

Mr. RYAN: And Sweden.

Mr. NIELSEN: Do not forget Saskatchewan.

The CHAIRMAN: Well, Mr. Mather, if you will make that information available to us.

Mr. MATHER: I will try to do so, Mr. Chairman.

Mr. GOYER: On the motion, Mr. Chairman?

The CHAIRMAN: This is on the motion, Mr. Goyer?

Mr. GOYER: On this motion, Mr. Chairman, I wonder whether this is not a little premature? Couldn't we first try and explore whether in principle we could actually study the advisability of such tests. I am not quite convinced at the outset, and even if we had evidence from medical and scientific experts that would not solve my problem either, because I am not even yet ready to look at such evidence. I am merely looking at it at this stage, from my own legal point of view, so that is why I personally would prefer that this motion be presented after we have discussed it at a further sitting.

(English)

Mr. MATHER: Mr. Chairman, I just want to say that, perhaps in relation to what you have said, it seems to me we have two points here, in general, to consider in line with the bill. One is whether we have mandatory tests and the other is what type of test.

Personally, I was very pleased and encouraged to feel that most of the members of the committee have come to the point of view of at least not brushing aside the possibility of having mandatory tests. In fact, I think a number of the committee would agree with that as a principle. As to the type of test, this surely is a matter where we are on the right track if we pass this motion to call the expert witnesses and get all the information we can. As I have said, my own view is that I think my bill is in line with both the aspects I have touched on, namely the need for the tests and it would provide what has already been accepted in a good many places as the basis.

Mr. WOOLLIAMS: Mr. Chairman, I do not want to be placed on record that I am in favour of mandatory tests. I was glad to see Mr. Nielsen move the motion seconded by Mr. Scott and was interested in Mr. Scott's presentation. What I want to do is to hear the evidence, and that may influence me on that particular matter. So I do not want to leave the impression, because of your statement, that I am in favour of mandatory tests at the present time. I want to hear the evidence and I will weigh those facts and then I will come to a decision.

Mr. MATHER: Mr. Chairman, I think if you will check, I said that it was refreshing to me to find a number of members of the committee are not just brushing aside the acceptance of that test. This is a step forward.

Mr. NIELSEN: My motion was made and I am sure all members took it as one which in no way commits any member of the committee at all.

The CHAIRMAN: It is a fact-seeking motion.

Mr. TRUDEAU: Mr. Chairman, I want to agree with Mr. Goyer here that if we get valuable witnesses to spend our valuable time discussing the question of fact and we have not reached some kind of a consensus in law as to whether we are prepared, even under the best possible physiological evidence, to recognize some kind of a mandatory test, I think we have lost a lot of people's time.

To take an extreme example, it would seem to me very likely that the most expert witnesses would say that the only test for impaired driving was whether

you are impaired or not and it may be that a man who was 8 feet tall would need much more than two or three ounces of alcohol or four or six per cent of alcohol in his breath. I think some kind of discussion should take place before we get witnesses down here.

Mr. SCOTT (*Danforth*): Mr. Chairman, on the point that has been raised, I can understand your feelings but it seems to me that it is impossible when the subject is still in the air to decide on a mandatory test that, first of all, you have to know what kind of tests are available, how accurate they are, how reliable they are, what kind of an onus you are putting on an accused and how they are taken, the conditions under which you are to be taken and how conclusive are they. And, once that is before you, you can then say, "Yes, I am prepared to take this very important step of imposing a mandatory test." But how can you decide on it being mandatory without having all evidence? It seems to me you are operating in a vacuum or certainly you are operating blind.

Mr. GOYER: I am not prepared, at this point, to accept a mandatory test, no.

Mr. SCOTT (*Danforth*): Well, nobody is suggesting that.

Mr. NIELSEN: Well, all these matters raised by Mr. Scott bear on the principle.

Mr. WOOLLIAMS: As we have to go to another meeting at 12.30 could we ask the question?

The CHAIRMAN: I was going to ask, if the Committee would agree, that the steering committee consider the contents of Mr. Nielsen's motion that we arrange to have these experts come before the committee. No-one is committed to anything in advance regarding whether they want a mandatory act or not. It is in order to give you the information on which you can make up your mind whether it is or is not necessary to have such legislation.

Mr. TRUDEAU: Can we assume, then, that the witnesses show that tests are absolutely conclusive and that you can reach absolute scientific evidence through blood or through breath or somewhere else that impairedness does exist, that then we are prepared to vote it?

Several hon. MEMBERS: No. No.

Mr. TRUDEAU: Well, if the answer is "No" then there is no point wasting these people's time. Supposing we get the best possible physiological evidence and we cannot refute it that you can find through a blood test or a breath test whether a person is driving safely or not. If we find this evidence and we say, "Oh, well, thank you very much but we still do not want to have anything compulsory," we have lost a lot of people's time, so let us decide now if we are prepared in the extreme case of scientific evidence to accept this.

Mr. BELL (*Carleton*): No, we are not prepared to.

Mr. TRUDEAU: If we are not, then I do not see why we should get gentlemen to come down and hear it, just to question them.

The CHAIRMAN: I think, on the face of it, whatever decision we come to about the subject matter, we want to be able to say, well, we have studied and this is our opinion. When you have the evidence, you may make up your mind,

well, I am not for any compulsory breathalyzer tests at all, on account of the evidence itself. But is this a fair question? Suppose that the breathalyzer tests were one hundred per cent accurate, what would your reaction be?

Mr. TRUDEAU: Some people may well say that they are against compulsion, even in your case, now.

The CHAIRMAN: If you are against compulsory—

Mr. TRUDEAU: I am not but perhaps the feeling of the committee is.

The CHAIRMAN: What we want to find out is what does the act perceive, what is the difference between the two manners of test.

Mr. BELL (*Carleton*): The reason I mentioned the Canadian Bar Association is that they have given detailed consideration to this very matter of the mandatory nature of the test and it is their expert testimony that I want to enable me to make up my mind on this score.

Mr. TRUDEAU: And study evidence before bringing medical practitioners here.

Mr. SCOTT (*Danforth*): You will all produce the same thing.

Mr. TRUDEAU: I do not agree with the motion, Mr. Chairman.

Mr. RYAN: Let us have the question, Mr. Chairman.

The CHAIRMAN: I think we should just agree that it be referred to the steering committee.

Mr. NIELSEN: Well, Mr. Chairman, may I suggest there are certain established rules governing the conduct of committee proceedings. There is a motion before the Chair.

The CHAIRMAN: I realize that, Mr. Nielsen.

Mr. NIELSEN: If you wish me to withdraw it, I have no objection.

The CHAIRMAN: I am just asking you to agree, for very obvious reasons, if you will count noses around the table.

Mr. NIELSEN: The only way you can do that, though, in view of the fact that there is a formal motion before the committee, is to put the question.

Mr. TRUDEAU: Just be on division.

Mr. RYAN: On division, agreed.

Mr. NIELSEN: Mr. Chairman, surely the steering committee does not operate on its own, it operates on instructions from the main committee and if there is a motion I am not prepared to withdraw it. I think this is one of the most important subjects we can discuss. Could you not say that the question was carried on division? Is that agreed?

Agreed.

The CHAIRMAN: The meeting stands adjourned.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 3

THURSDAY, MAY 5, 1966

Respecting the subject-matter of

Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles)

Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles)

Bill C-87, An Act to amend the Criminal Code (Impaired Driving)

Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and

Private Members' Notices of Motions Numbers 26 and 31.

WITNESSES:

Mr. R. R. Southam, M.P., Sponsor of Bill C-26

Mr. Ian Wahn, M.P., Sponsor of Bill C-49

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Goyer,	Mr. Otto,
Mr. Asselin	Mr. Honey,	Mr. Ryan,
(<i>Charlevoix</i>),	Mr. Laflamme,	Mr. Scott (<i>Danforth</i>),
Mr. Bell (<i>Carleton</i>),	Mr. Langlois (<i>Mégantic</i>),	Mr. Stanbury,
Mr. Cantin,	Mr. MacEwan,	Mr. Trudeau,
Mr. Choquette,	Mr. Mather,	Mr. Wahn,
Mr. Chrétien,	Mr. McQuaid,	Mr. Woolliams—(24).
Mr. Fulton,	Mr. Nielsen,	

(Quorum 10)

R. V. Virr,
Clerk of the Committee.

ORDERS OF REFERENCE

WEDNESDAY, May 4, 1966.

Ordered,—That the quorum of the Standing Committee on Justice and Legal Affairs be reduced from 13 to 10 Members.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House.

REPORT TO THE HOUSE

TUESDAY, April 26, 1966.

The Standing Committee on Justice and Legal Affairs has the honour to present its

FIRST REPORT

Your Committee recommends that its quorum be reduced from 13 to 10 members.

Respectfully submitted,

A. J. P. CAMERON,
Chairman.

(Concurred in May 4, 1966)

MINUTES OF PROCEEDINGS

FRIDAY, April 29, 1966.

The Standing Committee on Justice and Legal Affairs having been duly called to meet at 9:30 a.m., the following members were present: Messrs. Aiken, Bell (*Carleton*), Cameron (*High Park*), Forest, Mather, Ryan, Scott (*Danforth*), Trudeau (8).

In attendance: Mr. R. R. Southam, sponsor of Bill C-26.

At 10:00 a.m. there being no quorum, the Chairman, Mr. A. J. P. Cameron postponed the meeting to the call of the Chair.

Gabrielle Savard,
Clerk of the Committee.

THURSDAY, May 5, 1966.

(4)

The Standing Committee on Justice and Legal Affairs met this day at 11.10 o'clock a.m. The Chairman, Mr. A. J. P. Cameron, presided.

Members present: Messrs. Bell (*Carleton*), Cameron (*High Park*), Choquette, Chrétien, Forest, Goyer, Laflamme, MacEwan, Mather, McQuaid, Otto, Ryan, Scott (*Danforth*), Trudeau, Wahn (15).

Also present: Messrs. Grafftey, Latulippe, Members of Parliament.

In attendance: Messrs. Southam and Wahn, Members of Parliament.

The Chairman read a letter from the Minister of Industry in which the Minister referred to the interest of his department in the development of an automotive vehicle safety code. The Minister expressed his willingness to appear before the Justice and Legal Affairs Committee. The Committee accepted his offer.

Mr. Grafftey mentioned that the National Film Board had several films on the subject of motor vehicle safety and he offered to obtain the films and a list of witnesses to assist the Committee in its deliberations.

On motion of Mr. Scott (*Danforth*), seconded by Mr. Chrétien,

Resolved,—that Mr. Grafftey arrange for films on motor vehicle safety to be shown to the Committee by the National Film Board and that he suggest witnesses to appear before the Committee.

The Committee agreed that the sub-committee would recommend other witnesses to give evidence before the Committee.

The Chairman invited Mr. Southam to explain Bill C-26.

Following his remarks Mr. Southam was questioned.

The Chairman then invited Mr. Wahn to explain Bill C-49.

At 12.45 o'clock p.m. the Committee adjourned to the call of the Chair.

R. V. Virr,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

THURSDAY, May 5, 1966.

● (11:09 a.m.)

The CHAIRMAN: Gentlemen, we have a quorum, so the meeting is constituted. The first item on the agenda is a letter which I have received from Mr. C. M. Drury, the Minister of Industry. It is dated April 20th and acknowledges an earlier letter from myself advising that certain bills and motions pertaining to motor vehicle safety have been referred to the Standing Committee on Justice and Legal Affairs. The letter continues:

—that the Specifications and Standards Branch of my Department in its capacity as secretariat for the Canadian Government Specifications Board is developing an automotive vehicles safety code and the first meeting to consider this code is to be held in June of this year. I would be pleased, therefore, to appear before the Committee to explain further what my Department is doing in this field.

Now I presume that we would like to have Mr. Drury as soon as possible to find out what his Department is doing. Mr. Scott, have you some comments?

Mr. SCOTT: Yes. In your comments, Mr. Chairman, you said that certain bills had been referred to the Committee.

The CHAIRMAN: Certain bills and motions. Did I leave out the word "motions"?

Mr. SCOTT: Well, my problem is this. I am under the impression that it is the subject matter of the bills and motions that is before us. It seems to me this opens up the whole field itself, and I was just wondering what consideration the steering committee has given to the whole way we are going to handle the problem of auto safety and the type of witnesses we are going to call. For example, I would like to get Ralph Nader here who testified before the Washington committee; he is probably one of the top experts in North America on the whole problem of automobile safety. We have an expert here in Canada, Heward Grafftey, who certainly ought to be called.

The CHAIRMAN: The matter has not been considered specifically by the steering committee. The letter was before the steering committee and no specific action or policy was devised, but it does appear to me—in view of the fact that Mr. Grafftey has a motion, Mr. Mather has a motion, Mr. Wahn has a bill relating to the safety devices on motor vehicles, Mr. Southam has a bill relating to the same—it all relates to the subject matter of these four items which we are going to have to consider. My own personal opinion is that it will be relevant to have this evidence.

Mr. SCOTT: I beg your pardon.

Mr. CHAIRMAN: It will be relevant to the subject matter of what we have to consider to hear what that particular department is doing in devising a code. I am all for calling Mr. Drury.

Mr. Grafftey mentions that the government should give consideration to that.

Mr. MATHER: Mr. Chairman, I can see no real conflict of ideas here. Personally I would like to have the Minister here as soon as possible, and it would be valuable to him perhaps to see what we are discussing and valuable to us to understand something of what the government has in mind and while he was here I think we could proceed with consideration of the calling of witnesses as Mr. Scott has suggested.

Mr. SCOTT: The first thing is to call the Minister, Mr. Chairman. I am all for having him here so we can look at his voluntary code, but what I was wondering about is just how we are going to proceed through this very complicated field. Should the Committee, or the steering committee, not meet and try to devise some orderly method of investigating the problem rather than just hear witnesses here, there, and everywhere. I mean I think we should try to find out the magnitude of the problem. We have got all kinds of material here showing the type of problem that exists. We should devise some orderly method of going into the problem and try to find some solution.

The CHAIRMAN: Actually, we have had only two meetings, you might say, of the Committee in which we have heard evidence. As you know we had to adjourn the last meeting for lack of a quorum, and also it has been difficult to get the steering committee to meet to discuss these things. I have been more or less going along with the material we have before us, asking the movers of certain bills and the sponsors of certain motions to appear before us. I believe in that way in the end we will have considered the subject matter of the bills and of the motions. That is the position right now. For example, I did try to get in touch with Mr. Grafftey but he was away. We now have been in touch with each other. I know when he is available and so on, and he will be coming to explain his motion to the Committee. I know Mr. Mather is only too anxious to explain his. Mr. Wahn is here; Mr. Southam is here and I think that that covers all that we have in the way of bills and motions.

Mr. SCOTT: Before we get into the subject this morning I was wondering if there is any information available to us as to the progress being made by the Committee in lining up witnesses on the breathalyzer tests.

The CHAIRMAN: You will remember, Mr. Scott, that at the last meeting we adjourned owing to a lack of quorum. There was a report from the steering Committee which was not dealt with because the members considered there not being a quorum they did not want to deal with it. That is the situation and that is one of the things that we will be taking up right away. Yes, Mr. Grafftey.

Mr. GRAFFTEY: Mr. Chairman, apropos of your remarks about the Minister coming, I can only say that it will be very, very helpful to the Committee if he appears as soon as possible. I only suggest this—and I hope possibly we might get concurrence—that I could furnish to the Steering Committee some of the people who have been working with us, Mr. Scott, in this whole field in the last three weeks they have given me a fairly definitive list of witnesses we might

call, both in Canada and the United States: the top medical experts, legal experts and legislators in the field. Now, I express a willingness—you could term it as helpful—to supply this list that has been prepared for me in contemplation of such activities in this Committee to the Steering Committee and you could use it as you deem proper.

● (11:15 a.m.)

Secondly, Mr. Chairman, I would like at this time to ask, in the Committee's wisdom, if when some of us testify on this general area, if we could produce short films before the Committee. I know that this is a new idea possibly but the National Film Board have developed some top work on car injuries and deaths. Dr. Gikkas of Ann Arbor, Michigan, with Dr. Mosley of Boston, has developed some top film work in terms of the microbe—the car—in this epidemic. I do not want to take any more time of the Committee apart from giving you this list of witnesses we might call. I would just like to suggest to you, sir that I would be only too happy to make arrangements with the Film Board to project what I think are some significant films before the Committee as we consider this whole field. I just suggest this.

The CHAIRMAN: I would be glad to have general expression of opinion on that matter.

Mr. SCOTT: I now move that the Committee take advantage of Mr. Grafftey's suggestion and that in addition to witnesses we do have the National Film Board come over and show us the material they have. I know a little bit about it and I think it would be tremendously useful.

The CHAIRMAN: Secunder?

Mr. CHRÉTIEN: I second the motion.

(Translation)

Mr. O. LAFLAMME: I would like to draw the attention of members of the Committee to the fact that this bill before us this morning is a very important one. This bill might require very profound study by members of this Committee at the present time but nevertheless I remind myself of an experience we had in the Banking Committee. For 4 days members of the Committee studied a bill incorporating the Bank of Western Canada. For 4 days we were listening to witnesses and after that the bill was passed in the Committee. It went back to the House where, being a private bill, it was simply talked out by three members. Now we have here a very important bill for all members of the Committee. We will have taken the trouble to study it attentively, to hear witnesses and to take a decision on it. Now since it is a private bill will it not meet exactly the same fate in the house, if three members rise for 20 minutes each to undo all our work here? We will have been put in the position as having inquired into something, without being able to take the responsibility of any decision. So, I think this is very important for us to find out once and for all if every time such bills come before us, private bills that are very carefully studied in Committee, with very important evidence put on record, witnesses heard, and considerable expense incurred, they will meet the same fate on third reading if there are three members who, for reasons best known to themselves, undo all the work accomplished by the Committee by speaking 20 minutes each.

That seems to be my experience. So I think that the Committee should take a decision so that we can be given the assurance in this Committee that if we worked at and studied the bill and finally arrived at a decision, that decision will of necessity be endorsed or disposed of by the House. Or will this whole procedure be made ridiculous by three members saying they do not agree and preventing it from passing.

(English)

The CHAIRMAN: I can not give you any assurance on that, of course. Our report will go back to the House and I presume the usual concurrence will be asked and the report will be debated. What happens from there on, why I wouldn't care to make any comment.

Mr. SCOTT: These Bills have received only first reading.

Mr. CHAIRMAN: I know and they have to get second reading and so on if they are going to eventually pass into law or be dealt with. I think we had better proceed along the way we are and report on the subject matter of the bills and on the conclusion we come to in respect to them. The same thing applies in respect of the notices of motion. I think that this evidence we are getting is for the purpose of enabling us to give the House the benefit, for example, of our opinion on impaired driving, which Mr. Mather brought up. What is our opinion about his proposed change in the law? Are we in favour or are we against it and if so what are our reasons pro and con? That is the way it appears to me at any rate.

Mr. OTTO: Mr. Chairman, if we are to think that these bills, any of these bills, will be passed, I think would be deluding ourselves. The purpose of this Committee, as I take it, is to impress the government with facts and with arguments so that they will introduce measures. Since we have little power here except to examine, I do not think we should expect in our deliberations that any of these bills will, indeed, be passed by the House.

Mr. MATHER: Mr. Chairman, if I might say a word on this point. I think the idea behind encouraging members who have bills and resolutions, as I have and others have on traffic safety, to send them more or less to this Committee was to get the early and concentrated attention both in the House, in the Committee and in the public mind, of the seriousness of the general subject with which they all deal. As to what will happen to them if or when they get to the House or get through this Committee, I think you are quite right, we can not say, but I do feel that the attention we will get by working as we are now doing together on this general subject can only be beneficial.

Mr. LAFLAMME: Mr. Chairman, I could have been misinterpreted. I do not say that after the bill has been passed by the Committee it will be approved by the House. I did not say that. The only thing I said was that the House itself will have the opportunity of approving the bill or not.

The CHAIRMAN: There is no question about that. We are debating the motion of Mr. Scott, seconded by Mr. Chrétien, that we accept Mr. Graftey's offer of securing evidence of T.V. or whatever character it is, for the use of the Committee—so that we may be better informed in dealing with the subject matters referred to us. Is there any further debate on that motion?

Mr. IRWIN: Mr. Chairman, there is just one point I think I should bring up and that is what about this Committee being a committee of record in this respect? Should there be a duplicate of the film filed with our records or is this not a consideration?

The CHAIRMAN: I don't know how it could be a matter of record. Maybe Mr. Grafftey might be able to answer that.

Mr. GRAFFTEY: Well, it is hard to answer; maybe we are setting a precedent. I do remember in the United States in front of the Senate Committee, when Mr. Hoffa testified, he had a film in his hand and I seem to recollect that he handed it to the clerical staff of the Committee for record.

Mr. SOUTHAM: Mr. Chairman, as you know I am vitally interested in this discussion with respect to the proposed measures regarding safety of the public on highways. I am very pleased that we have this intimation from the Minister that he would like to appear before us. I substantiate and support Mr. Scott's suggestion of bringing witnesses. I was particularly impressed with his reference to Mr. Nader who I do feel and I think Mr. Grafftey would support me in this contention is one of our best experts in this field on the continent and also the remarks made by Mr. Mather and Mr. Grafftey in this respect. I think that we should have the benefit of all the expert advice and witnesses that we can have in presenting this problem to the government for their consideration, and we hope in due course that they will take action and incorporate it into whatever legislation they see fit.

Mr. SCOTT: Mr. Chairman, before we go any further, I suggest—and no doubt you have already considered it—that you as our Chairman might consult with Senator Magnuson in the United States who headed up a very important series of hearings in this whole field; no doubt he might be interested in the work of this Committee.

The CHAIRMAN: I will take that as an observation. I don't think it is relevant to the debate as on this particular motion. All those in favour of the motion as proposed? Contrary, if any?

Mr. MATHER: I don't know if the motion was made to welcome the Minister to our deliberations.

Mr. SCOTT: That was in the motion. There was some comment on it and Mr. Grafftey—

Mr. MATHER: We make our own rules.

The CHAIRMAN: Will you include in your motion, Mr. Scott and Mr. Chrétien that we invite the Minister to appear as a witness and explain what is going on in his Department?

Motion agreed to.

Then Mr. Mather could you give the Committee information regarding the supplying, at a future date, information regarding legislation of certain countries?

Mr. MATHER: I am seeking that but I have not as yet secured the information.

The CHAIRMAN: Then there was a motion by Mr. Neilsen, "experts to testify on mechanical means by which various tests are applied." The Clerk of the Committee has called the Police Department in Ottawa. The breathalyzer experts are available here, that is in the police quarters in Ottawa; demonstrations can be given to members of the Committee at the Police Station, Waller Street. The breathalyzer machine cannot be moved. There is no blood testing done at the police station. Now, that is the situation in regard to Mr. Nielsen's motion. Is there any comment? Does any member of the Committee want arrangements to be made to go to the police station to watch one of these breathalyzers in operation or not?

Mr. RYAN: The Law Society in Toronto I believe had the facilities brought before them by the Province. I just wonder if there should not be a check made at Queen's Park to see if we could not have some better equipment for our purposes here.

The CHAIRMAN: I would not want to make any arrangements unless there is a general concurrence of opinion that they would like to go to one of these demonstrations and see it in operation. If there is no such concurrence, well, I think we had better drop it.

Mr. NEILSEN: I will be glad to do the talking.

Mr. SCOTT: Mr. Neilsen is already a monopoly on that position. Well, I do not know whether it is necessary to go and watch a test actually being given, although it might be interesting. I would suggest that what we are more interested in is the expert evidence that goes to the whole root of the breathalyzer test itself. Since our last meeting I have had numerous communications come in from people in the field outlining more than I had thought the basic uncertainty of the test itself. I would like to suggest to the Chairman that he contact not just the police department who are already convinced of the efficacy of the test and are not interested in questioning it except having it made compulsory, but the National Research Council where some very good work, I understand, has been done in investigating the reliability of this test. What we are really interested in is medical testimony. What we need is some biologists to come here because I am now informed that the breathalyzer test does not measure alcohol at all, that all it really measures are other ingredients in the blood and in the breath that arise from oxidization. That there is no way of knowing from the breathalyzer the amount of alcohol that a person has either on their breath or in their blood. It seems to me that what we are interested in is the type of scientific evidence to go after reliability of the test itself, and I think it would be useful to have people from the Attorney General's Department to go into this whole area rather than just a police officer giving somebody a breathalyzer test.

● (11:30 a.m.)

The CHAIRMAN: Mr. Mather has made certain suggestions which have been considered by the steering committee but not by this Committee he suggested or recommended that the following might be considered as witnesses. Dr. Wallace Troop of the Canadian Medical Association who is an expert on blood testing and breathalyzers. Is that right, Mr. Mather?

Mr. MATHER: That is right.

The CHAIRMAN: And is resident in Ottawa. Mr. E. H. S. Piper who is a barrister and I take it the counsel for the Canadian Highway Safety Council who is also reputed to be an expert; professor Ward Smith of the Canadian Highway Safety Council, also reputed to be an expert and connected with the Department of the Attorney General of Ontario. Mr. Mather's memo says that both Mr. Piper and Professor Ward Smith can be contacted through the Ottawa headquarters of the Canadian Highway Safety Council. He also suggests the name of Dr. C. C. Moskovitch, head of Alcoholic Research Foundation, Vancouver, and Dr. Don Penner, Department of Pathology, the Winnipge General Hospital. Now, that has not been dealt with by either the steering committee or this Committee as to whether we want to call these witnesses or we want to call some of them and whether we want to consider calling other witnesses. I will be glad to have your views. I think you have all got a copy of this, haven't you? You should have if you haven't.

Mr. MATHER: Mr. Chairman, I do not disagree with my colleague Scott on calling all witnesses possible pro and con this test, but I think the immediate point we might look at is whether any of us would like to go and see how the breathalyzer test is actually administered. I for one would be quite willing to do that. I think it might be interesting. It would not influence our decision on whether we want it administered.

The CHAIRMAN: Probably arrangements can be made and those who want to do that can do so. I think it is a matter of their own personal wishes I do not think—

Mr. BELL(*Carleton*): Mr. Chairman, my understanding is that this whole matter was referred to the steering committee and I suggest that it be considered by the steering committee and they come forward with a plan of action for us and then at that stage we can discuss it. It seems to me, with great respect, that we have lost nearly half an hour this morning just going around in circles on these matters and until someone takes the responsibility of bringing a plan forward, we are not going to get anywhere.

The CHAIRMAN: I think your comments are very much in order. The thought has been going through my mind too but that is the way it has been handled up to the present, Mr. Bell. We have got the situation on our doorstep. If you want to refer it back to the steering committee, that is fine. I had an idea that Mr. Scott would probably want some additions or suggest witnesses and if he wants to make them now to the steering committee, I think this would be a good time to do so.

Mr. SCOTT: Yes, I will supply you with the list, Mr. Chairman.

The CHAIRMAN: Well, then is it agreed that this matter go back to the steering committee to study the witnesses that we should call, in particular to deal with Mr. Mather's bill and—

Mr. SCOTT: Should the steering committee go further and actually contact the witnesses and find out who is available and when you bring the report back give us some idea of when they are available, when we are likely to interview them and sort of a timetable for the whole thing. We don't want you to come back and say we recommend these witnesses.

The CHAIRMAN: Mr. Woolliams, you will recall, wanted us to get the information or whatever could be supplied by the Canadian Bar Association. They have dealt with this matter of breathalizers and blood tests and so on. It was suggested Mr. Merriam be contacted to see what was available. Well, these things will be done. It is just an illustration of what happens though when you cannot get a quorum. Things do not proceed as fast as one would like.

The next order of business is to invite Mr. Southam to explain Bill No. C-26 and following his presentation and questioning to ask Mr. Wahn to explain Bill No. C-49. That will be followed by a general discussion. Mr. Southam. I think you all have a copy of his brief.

Mr. SOUTHAM: Mr. Chairman and members of the Committee, it is my pleasure to present for your serious consideration Bill No. C-26 which is in effect an act to amend the Criminal Code and, more particularly dealing with "safety devices for automotive vehicles".

The purpose of principle of this proposed bill is to protect and save life in so far as it is possible to do so, and I suggest that one way to assist in reaching this desirable end is to make it mandatory by law to have all motor vehicles including cars, trucks, motorcycles, or similar type vehicles that are manufactured or assembled in Canada, equipped with all tested and proven safety devices now presently recognized as about twenty in number.

Mounting concern and widespread alarm is evident here, in United States and in Great Britain in recent months due to the ever increasing slaughter of human life on our highways. Typical of this concern was expressed in a news item appearing in daily papers across Canada in January, 1966, in which an associated press report stated in headlines as follows—

49,000 traffic deaths in the United States sets record.

The item went on to state that the record toll of 49,000 traffic deaths in the United States last year was reported by the national safety council. The council said 1,800,000 persons suffered disabling injuries in 1965 motor vehicle accidents. The economic loss was calculated at \$8,500 a million—\$5,500 million of this was in wage losses, medical expense and overhead insurance costs.

One has only to look at our own dominion bureau of statistics or Canadian highway safety council statistics, or to pick up almost any daily paper at random to have these alarming figures verified.

I personally became interested in this serious situation several years ago when Dr. Kucherepa, representing a Toronto riding and a former colleague, placed on the records of the House of Commons not only his personal views, but those of the Canadian safety council, and many other private citizens who were becoming aware of this serious problem at that time. Following up my concern in the matter I wrote to the department of health, education and welfare, public health service, division of accident prevention, Washington, D.C., in the spring of 1965, and received a copy of a number of bills and resolutions that had been placed before the United States senate in connection with this matter of grave concern to the safety of the people on our public highways, and more particularly as it related to safety devices on automobiles. Upon receipt of this information I discussed with Dr. Ollivier and his assistant as to what might be the best approach in formulating a bill to deal with the matter here

in Canada, and it was upon their advice that we decided that an amendment to our Canadian criminal code through a private member's bill would be the most practical way to initiate a debate on the subject. As a consequence my proposed Bill C-26 was developed and placed on the Order Paper, that would be January of this year.

I might say herewith that I was more than pleased to find out later that my colleague, Mr. Heward Grafftey, member of Brome-Missisquoi, was also pursuing studies along the same line. This was demonstrated when he appeared on the program "This Hour Has Seven Days" late last fall and was interviewed at some length in connection with his views with regard to safety devices on automobiles, and might I be allowed to say, Mr. Chairman, that he did a very commendable job in presenting the point of view on this programme.

I would also like to say that two other members of the House, Mr. Barry Mather, who has a resolution on the Order Paper No. 26, under the date of January 20, and Mr. Ian Wahn, a private member Bill No. C-49 under the date of January 24 on the Order Paper, dealing with the topic of safety devices on automobiles, demonstrating their deep concern with this serious matter of death on our highways.

Criticisms of auto companies have been mounting steadily in recent months as more and more people become aware of what could be done by auto companies to protect them. Auto companies, themselves, have made many advances in safety testing and new safety devices for cars in recent years, but there is still widespread reluctance, I feel, on the part of car manufacturers to incorporate any or many of the safety devices into their vehicles, due to the economic factor involved.

It is understandable that when the inclusion of new safety devices is voluntary, auto manufacturers in order to present a more competitive price for their product on the market would feel inclined not to increase the wholesale price of their car by including safety devices as standard equipment.

Herein lies a basic principle of my Bill C-26. If it was made mandatory that all motor vehicles in Canada should have these safety devices included, they would at once all become competitive as to price insofar as the buyer is concerned.

Mr. Chairman, in order to support my contention that our government should give serious consideration to the passing of legislation to make it mandatory to have Canadian automotive manufacturers include all tested safety devices as standard equipment on automobiles, may I point out that our great neighbours to the south presently have a Senate committee making comprehensive study of the same problem. It is interesting to note that our fellow colleague, Mr. Heward Grafftey, was invited to the United States during the Easter recess to give testimony before this committee relative to what action might be taken in this respect in Canada, and other information pertinent to the general problem.

It is also interesting to note that Mr. Ralph Nader, a 31 year old Washington lawyer after intensive study in the matter of safe cars, wrote a book entitled "Unsafe at any speed" which, in so many words, is a denouncement of what he called Detroit's deliberate sacrifice of safety on behalf of

hot-selling stylishness. It would appear that the research by Mr. Nader was so authentic that it raised the alarm of General Motors who have now been called on the congressional carpet because of their unorthodox activities in placing detectives on the trail of Mr. Nader to see if they could get what one might almost term "blackmail evidence" in order to quieten him.

Actually, in effect, the result of General Motors questionable practice in this case was to propel the entire subject of automobile safety further into the public limelight and to step up the pressure for Federal testing and safety standards.

I would also like to suggest at this point, Mr. Chairman, that whether or not our federal authorities feel that the time is opportune to enact legislation such as proposed by Bill No. C-26, we should at least take a leaf out of the United States book and establish a federal subsidized research program similar to that underway south of the border.

It is interesting to note that much research is presently underway in the United States in centres such as the University of Minnesota, University of Los Angeles, Wayne State University, by the Liberty Mutual Insurance Co., besides that presently going on in the United States Senate in Washington to which I have referred.

This, Mr. Chairman, completes my arguments for the moment in support of my bill and I would be only too happy to answer further questions or make further comments in connection with the principle involved when it is under discussion by members of the Committee.

The CHAIRMAN: Thank you very much, Mr. Southam. You have now agreed to subject yourself to questions and I see Mr. Otto has his hand up and wants to ask some questions.

Mr. OTTO: Mr. Chairman, I wonder if I could ask Mr. Southam a question in connection with the first part of his comments where he says "not fully equipped with the following safety devices, seat belts and anchorages therefor". Have you any figures, Mr. Southam, as to the number of people who already have seat belts but who do not use them or who do use the seat belts?

Mr. SOUTHAM: No, I have not actually. I just have the knowledge that most members of the Committee I think have in this respect and that is that information has come to our attention in the last year or two to the effect that cars equipped with seat belts have fewer fatal accidents. On the basis of medical evidence, they anticipate or more or less arrive at a figure that about 30 per cent less fatal accidents occur under some circumstances with people that wear them, but nobody has any figures, I do not think, to indicate actually how many people use their seat belts.

Mr. OTTO: Have any tests been conducted? From my recollection I think I have ridden in hundreds of cars over the past four or five years, equipped with seat belts, and only on one occasion do I recall the driver actually fastening the seat belt. I do not put this to you merely to contest the idea of seat belts but I wonder if you have given any thought or any consideration to the idea, not only to the installation of seat belts but to seat belts which if not fastened and not used will make the car inoperative. In other words, there has been this idea suggested in many of the articles that seat belts should be such that they have

to be fastened in order to get the car going. I thought you might have some figures of the percentage of people who have seat belts but do not use them which would give us some idea of the effectiveness of just having seat belts installed.

Mr. SOUTHAM: No, I do not think there has been anybody who has been able to arrive at those figures—I have not seen any.

(Translation)

Mr. J. P. GOYER: Could we be told what is the proportion or percentage of cars manufactured in Canada?

(English)

Mr. CHAIRMAN: Can you answer that, Mr. Southam?

Mr. SOUTHAM: I would like to hear the question again, Mr. Chairman.

● (11:45 a.m.)

Mr. GOYER: No, do you have any idea of the percentage of motor vehicles fabricated in Canada?

The CHAIRMAN: You mean by the year, do you?

Mr. GOYER: Yes.

Mr. SOUTHAM: I have not that figure—I would like to put this into focus. There are a number of causes of fatal accidents, of course. I think the first thing is what we often refer to in a slang sense as the nut behind the wheel. This is something that we cannot legislate on entirely or to discuss too lengthily but we know it is one of the basic problems as far as fatal deaths are concerned. The next are the highways themselves and the provincial laws regulating traffic control and so on, which is another field. When you get into the field of fatal accidents—once the accident has taken place whether it is a fatal accident or a serious injury, and medical science is called in to allocate the cause of the death, then this is where the pertinent figures come out that prompt me—and I think people like Mr. Grafftey and many other people—to look at the situation. When you look at the medical statistics you see that many deaths are caused by what they call backlash or a person being thrown into the windshield and so on. Now, this is where the safety belts, for instance, come into the picture. Medical science by statistics indicates that when people do use them, fatal accidents are cut by roughly 25 to 30 per cent.

Another statistic shows that the little arm that holds your rear vision mirror protruding from the ceiling of your car, when an accident takes place, penetrates the skull. Many people have been thrown against the windshield and against dashboards and consequently we have had padded dashboards which help to eliminate this. It is also very interesting to note that knobs projecting from the instrument panel, for instance, the controls of your radio, have penetrated the human skull causing a fatal accident. If a car has been rolled over, medical statistics indicate that the door handles and knobs protruding from the side of a car have fractured skulls, and so on. So that this is the field that I am concentrating on rather than the number of cars as far as the automotive statistics are concerned. As far as the law is concerned, it is not mandatory that it is just optional that automotive companies instal seat belts—

Mr. BELL (*Carleton*): I do not think, Mr. Chairman, that Mr. Southam has dealt with the point that Mr. Goyer is interested in and I am very much interested. May I put it this way. This bill deals only with vehicles which are manufactured in Canada. What was Mr. Southam's reason for not applying it as well to the importers of vehicles from abroad? Was that merely an oversight or was it intentional? Following from that, what part of the problem does this bill really deal with? I think that was Mr. Goyer's point.

Mr. SOUTHAM: Well, I think I must admit, Mr. Chairman, that in the wording of my brief here I should have used the phrase "for sale in Canada" no matter where they originally were manufactured or imported from, and so on. The fact that they are sold to the Canadian public.

The CHAIRMAN: I shall call first on Mr. Mather and then Mr. Forest, Mr. Chrétien and Mr. Graftey.

Mr. MATHER: Mr. Chairman, I was just going to say, in relation to the statistics on the use of seat belts, I am not sure but I think we could secure something on that subject from the Canadian Highway Safety Council or the Canadian Automobile Association. I think they have looked into that field. I will try and get that.

Mr. SCOTT: This might be helpful to the Committee. I have some material from the congressional record and it states that if a person is thrown from the car, the chance of death is five times as great, which seems to point out what Mr. Forest has been saying that research shows that if you do not have adequate seat belts your chances of being killed are five times as great in the event of an accident.

Mr. OTTO: Does the congressional record state that the seat belts are in the car or the seat belt is fastened on to a person?

Mr. SCOTT: Well, we cannot make the nut put them on. What we can do is require that they be installed.

The CHAIRMAN: Instead of having the Chairman write or the secretary of the Committee write, is there any reason why, Mr. Scott, and other members of the Committee who like yourself are referring to the congressional records you can not write and ask for that information, put the information you want in the words that you want it in, and then supply that information to the Steering committee who, in turn, can place it before this Committee.

(Translation)

Mr. LAFLAMME: This bill applies to the question of cars manufactured in Canada when we know that at least two-thirds of the cars used by Canadians are manufactured outside Canada, and that other countries would not apply the same restrictions. Are we then to require Canadian manufacturers to fit these security devices to vehicles which would not be used here nor in the cars after they are exported? So how can we possibly make applicable a bill the principles of which I approve, in the interests of greater safety, but the provisions of which would apply only to cars manufactured in Canada?

(English)

The CHAIRMAN: What the Committee is supposed to do is consider the subject matter of the bills, and decide on what we see is good in them, what we approve of, what we see is bad in them or defects in them. Then we report on

them. But we do not do anything more than that. We report on the subject matter. We may, for example, say, well this bill would not affect automobiles manufactured outside of Canada. Then you could have automobiles coming in which would not have these safety devices.

Mr. LAFLAMME: Not only that; they could be manufactured in Canada and sold outside in a country where they do not insist on having those things.

The CHAIRMAN: That is the job of the Committee, as I see it. Mr. Forest, I believe you have a question.

Mr. FOREST: My questions were asked by Mr. Bell and Mr. Laflamme.

Mr. CHRÉTIEN: I wanted to ask a question about why you put an exception for the buses.

Mr. SOUTHAM: I am not too well versed in the law in this respect but in looking at some of the evidence and literature that I have been reading with reference to the investigation in the United States, I found that apparently they excepted buses. I do not know whether it is because they are so large and they are public conveyances or not but they took it out of the field, I think, of the private automobile and vehicle. I am not sure why this was done but I felt that I would be maybe overstepping the mark here as far as presenting my private members bill is concerned if I included buses in this bill.

The CHAIRMAN: Mr. Grafftey and then Mr. Bell.

Mr. GRAFFTEY: I was going to ask the same question. I would like some very brief questions of the witness, if I could consider Mr. Southam as a witness in this instance. First of all, I am also very doubtful about the exception of buses because early this morning I was looking at some research forms we were going over. We saw a head-on crash between two school buses, going 25 miles an hour—we simulated cars with dummies—and those children in the back of the bus who did not have seat belts went right through the front window. They travelled a number of yards and scientific research seems to prove to us in our research studies at Cornell, U.C.L.A. and Harvard School, that we should certainly mandate the seat belts on buses. I do not think at this stage, without calling more technical witnesses, we should get into the debate too much. I am doubtful about it. I think maybe future witnesses could clear up just why you have got the notation on buses.

Mr. OTTO: That is only for buses.

Mr. GRAFFTEY: "Seat belts and anchorages therefor; padded dashes and visors, except on buses". That is except on buses in 226B. It seems to me it would include seat belts.

Mr. OTTO: I think Mr. Southam answered the question about padded dash and visors except on buses so it is only the padded dash and visor.

Mr. BELL (*Carleton*): The way the bill is drafted you have to put seat belts on buses but you do not have to put padded dashes.

Mr. OTTO: That is what it seems.

Mr. GRAFFTEY: All right would you add a colon or a comma in there. Then I would say the same thing would apply. I would wonder why padded dashes and visors would not be on buses to protect the driver of the bus anyway.

The CHAIRMAN: You were going to ask questions. You are now submitting arguments.

Mr. GRAFFTEY: No, I would like to know why.

The CHAIRMAN: Ask Mr. Southam why he did this or did not do it.

Mr. GRAFFTEY: Yes, Why, Mr. Southam, have you limited your description of mandatory features to about twenty items?

Mr. SOUTHAM: Well, here again, it is a relative figure. Since we have not set up a test bureau here in Canada, to actually come out and officially designate what is a safety item, and so on, we had just to arrive at some figure. I discussed this with Mr. Ollivier and he thought that to demonstrate the intent and the principle of the bill this was a relatively sound figure to arrive at, and we did go into this. We had quite a discussion with the law officers of the Commons to get something that was reasonably comprehensive to initiate the debate, as I say, to amplify this whole problem.

Mr. GRAFFTEY: Were the law officers of the crown in touch with the latest scientific information in this regard which indicated there were only approximately twenty features that were already scientifically proved?

Mr. SOUTHAM: Well, actually, Mr. Grafftey, we used some statistics that I got from the department of health and education and welfare of the public health services division of the accident prevention department in Washington, D.C., listed as 20201. We are actually relying more on outside research than what we have done in Canada in this respect.

Mr. GRAFFTEY: That is right. You have no more conclusive evidence to give the Committee on why you have put exceptions in there for buses?

Mr. SOUTHAM: No. I mean no more than that Dr. Ollivier in his wisdom and in reading what law there was and the act as he saw it now—I do not know just where he got his information—he felt that this was the way it should be worded. As I say, not being versed in legal matters, I would not like to go into that detail of it. But this, of course, is an interesting discussion. I am one hundred percent with the idea that if buses could be included or any other automobile vehicle that is transporting the public on our highways, public highways, it should be finally incorporated in any legislation that the government might see fit to bring in, in this respect.

Mr. GRAFFTEY: You did bring before the Committee just a few moments ago testimony about the effect of wearing seat belts. Am I to understand that the moment a person attaches his seat belt, in your view, he reduces the possibility of death by approximately thirty percent?

Mr. SOUTHAM: This is a good estimate as far as the present information we have is concerned. This is, as I say, based on the medical reports after the fatal accident has taken place or serious accident where people have become injured. They have been found in their car with their seat belts on. These statistics were

compared with other statistics previous to this where they did not have seat belts on. In a similar set of circumstances, the accident was fatal; for instance, being thrown out of the car, and so on.

Mr. GRAFFTEY: Have you any statistics, Mr. Southam, which would indicate the percentage one reduces the possibility of injury when one puts on a seat belt; from New York state, for instance, where they have made seat belts mandatory?

Mr. SOUTHAM: No, I have not. I am sorry.

Mr. BELL (*Carleton*): I am interested, Mr. Chairman, in the constitutional aspects of this bill and I gather that Mr. Southam has had pretty lengthy discussions with the law clerks. Is it the view that Mr. Southam has that this bill is in pith and substance criminal law and would be so held, or is it in pith and substance a matter of property and civil rights?

Mr. SOUTHAM: Well, Mr. Chairman, to answer that question, Dr. Ollivier did discuss this point with me and he felt that any proposed legislation dealing with this problem should come under the Criminal Code. He felt that this was the only way to make it effective. That was his advice and I took his advice on that matter.

Mr. BELL (*Carleton*): His advice is that this is in pith and substance criminal law.

Mr. SOUTHAM: That is right.

The CHAIRMAN: Mr. McQuaid, Mr. Scott and Mr. MacEwan.

Mr. MCQUAID: Mr. Southam, in your bill you speak of recessed dash instruments and control devices. Now I presume you mean there that control devices must be recessed too. Now, just what control devices have you got in mind?

● (12 noon)

Mr. SOUTHAM: Well, some of our automobiles, for instance, have a gear shift where the control is protruding, for instance. There are some on the dash; any instrument that helps to control your car that has a knob or metal projection. It has been held by medical authorities that these are basic causes for the accident becoming fatal once the accident is in process, such as a crash or side-swiping or anything else. It is an all-inclusive term as I understand it. Does that answer your question?

Mr. MCQUAID: Of course, the steering wheel, for example, is a control device.

Mr. SOUTHAM: Now, this is a very interesting point, Mr. Chairman. I believe that Mr. Grafftey and other people who have been doing research on this will support me in this contention. Automobile companies right now, I think one or two of the major companies, are developing a telescopic steering device. In case of an accident the impact of a person against it will cause the steering column to telescope in effect; in other words, break the blow against the chest wall, for instance.

Mr. MACEWAN: Just following up what Mr. Southam had to say, Mr. Chairman, I just want to ask him this. Do you believe, Mr. Southam, that an amendment to the Criminal Code is the best way to enforce the safety measures?

Mr. SOUTHAM: Yes, from my experience in talking to people and driving a car myself and the general indifference on the part of a lot of people, I think the only way that this could be made effective is to make it mandatory, by law in the Criminal Code; make it mandatory, that these safety devices be incorporated in our cars and, of course, then it is up to the individual to take advantage of them or not. That is where the element of freedom comes in; I mean freedom of action. A person does not have to put on a safety belt but if it is there, why, the chances are that he is going to get accustomed to using it. If the other automatic features, recessed dashes, recessed instruments for opening and closing the windows, for instance, padded dashes and all these other things, are there: he has no control of these. The safety devices are built in. He is automatically protected. He has two features. You take the head rest, swings from the ceiling, seat belts and certain types of safety devices, they are left to the option of the passenger himself whether he uses them; but there are a number of other safety devices that could be built in. There is no question about it, on the basis of the information we have now, they would save a lot of lives.

Mr. MACEWAN: Now, finally—and this is hypothetical because we have to hear the Minister, Mr. Drury, on this—if the Minister proposes to bring before Parliament a type of safety code for this type of vehicles in Canada, what would you say to that? How should that be presented? Should that be incorporated as part of the Criminal Code?

Mr. SOUTHAM: Well, I feel that our neighbours to the south are quite a bit ahead of us in the study of this matter. I have mentioned in my brief the various places at which these studies have already been undertaken. I think that Mr. Drury in his wisdom, and with the advice of the government, should set up a safety device testing centre here, make a study of it, get all relevant information, bring in legislation making it effective and then incorporate the information from time to time in any legislation that would be passed, as far as safety devices are concerned.

Mr. MACEWAN: By separate legislation or by effecting amendments to the Criminal Code, if I like it or not. That is all. I do not expect you to answer that.

Mr. SCOTT: Mr. Chairman, what I wanted to say is not so much a question to the witness because, Mr. Forest, we are really using your bill, as you know, as a sort of a vehicle to open up this whole field, but I was interested in the constitutional question Mr. Bell raised. I would hope that we would not get bogged down in our hearings here in the whole problem of the constitutional enforcement, because I do not think any of us are under any illusion as to the powers of the Committee. We can hear evidence; we can make recommendations, but we have no power to legislate. Really in our hearings here we should not be too concerned at the moment with whether or not recommendations can be legally enforced.

It seems to me we have two problems facing us. We have, first, an educational problem of trying to point out to the public the whole need for safety in motor vehicles, and in some way try to counteract the brainwashing that has gone on by the motor companies in inducing the public into accepting beautiful cars instead of safe cars. The Committee can do a great public service in the form of education by our hearings. In this case we should not worry too much about how the matter will be brought into legislation. If we can come up with recommendations that are sensible, and after we have looked at the problem, come up with a solution, then we can worry about how these are implemented either in cooperation with the provinces or something else at a later date. I would hate to see us get bogged down initially in worrying about the constitutionality of it, whether it should be under the Criminal Code, whether it should be by way of export policy or import policy or regulations in that fashion. Again, I think we are getting into the same problem that we had with the breathalyzer; we can wander all over the place and never really come to any conclusion.

The CHAIRMAN: With regard to the conflict of jurisdiction, I have a letter from the minister saying that either he or one of his deputies would be glad to appear before the Committee, and answer any of these legal problems, or give their views on these legal problems, if we, in our wisdom, thought we wanted them.

Mr. BELL (*Carleton*): I do not think there is any danger of getting bogged down with one brief question on this subject.

Mr. SCOTT: No, but I know how we love this.

Mr. CHAIRMAN: Well, I think we have to keep within the terms of our reference.

(*Translation*)

Mr. CHOQUETTE: I would like to ask the witness, something that has rather struck me, and that is that in this amendment we are asked to make an infraction of manufacturing. It seems to me that that is rather incomplete, because we cannot stop people from manufacturing an automobile if, for instance, it is just for trial purposes. It seems to me that in this drafting, the test is incomplete. We should refer to "manufacturing with a view to use", because it seems to me that it is rather clear that this section is somewhat inspired by sections 221, 222 where it is said that there is criminal negligence only in those cases where the person involved has been criminally negligent in the actual operation of the automobile. In other words, it is necessary for the car to be on the public highway. Somebody who would be engaged in trials, who is manufacturing a car, and who has not been taking the measures provided for under this amendment, should not be found guilty just because he was manufacturing a car. I hope you understand this shade of meaning. It is not just the mere manufacture that should be a violation of the law. I think we should state that quite clearly in the bill, since we are dealing with manufacture with a view to the sale of automobiles. I do not know whether my friend, Mr. Graftey, understands this shade of meaning. First of all, do we have a standard definition throughout this country of an automobile vehicle? Could the ski-do manufacturer, for instance, be liable to conviction on a criminal charge? For

instance, if we talk about ski-dos, may I just digress a little, Mr. Chairman. I do not know whether the translator is giving the idea that I want to explain. The point is that the ski-do manufacturer for instance would be guilty of a criminal offence under this bill as it stands at present because there is no clear-cut definition of a motor vehicle in the Criminal Code. For I suppose it is a matter of administrative law. Mr. Laflamme, what would be the definition of a motor vehicle in the province of Quebec? Is it not a matter of administrative law?

Mr. LAFLAMME: Yes, it is in the Motor Vehicles Act.

Mr. CHOQUETTE: It is a Provincial act in Quebec. So there the definition of an automotive vehicle is quite clear. You will understand when I say that there is no such definition in the Criminal Code. Under sections 221 or 222, if we find somebody drunk and driving a car, then it could be pleaded that the automotive vehicle is not defined. That is why we have been careful to state that it is the operation of the car that is involved.

(English)

Mr. CHAIRMAN: That is criticism of the drafting of the bill and that is something that we will have to consider. We will have to consider the subject matter of the bill. Is this a proper approach to the problem? What is our view on that? That is what we will be reporting back to the house, I would take it.

Mr. CHOQUETTE: In that case, without asking for an answer of the witness, can I just suggest to the Committee that there exists a difficulty which is rather a thorny one. If we were to leave the text as it stands now, because it is certainly not possible to convict anybody of having manufactured an automotive vehicle which does not meet these conditions. We shall have to establish some kind of a link between the manufacture and the intention to put it for sale. We cannot just say, "manufacture a car", but we should say, "manufacture a car for the purpose of selling it." That is what I wanted to make quite clear.

Mr. CHAIRMAN: We will get to that stage maybe some time later on. We are not a court and we are not determining the legal effects of the bill. We are considering the subject matter of it, and if we consider the subject matter, then we make a recommendation.

Mr. CHOQUETTE: Yes, I entirely agree but I thought this was the right time to bring up that point in the drafting of the bill.

Mr. CHAIRMAN: —we have Mr. Wahn here.

Mr. CHOQUETTE: What would you say about that, Mr. Southam? Have you anything to say about that?

Mr. SOUTHAM: Well, the only thing I can say, Mr. Chairman, is that this is a draft bill dealing with the subject under discussion, provided for me after lengthy discussion with the law officers of the Crown. I am sure that it will have flaws in it. There is no doubt in my mind. All that it does is to attempt to open up the discussion. I am very pleased that the government saw fit in their wisdom to cooperate with people like Mr. Wahn, Mr. Mather, Mr. Grafftey, Mr. Scott and other people who are all involved in this general topic, and referred this to our Committee for discussion. All we are doing is keeping in step with public opinion and, I think, public demand, in the interest of safety. Our great neighbours to the south are already in the throes of a similar debate through a congressional committee. I would like to add here, Mr. Chairman, in support of this whole principle, that there is an inconsistency some place here in Canada—it

may be in the states too—in the various modes of travel, for instance, comparing automotive travel with air travel. Immediately there is an accident in air travel with a plane falling to the ground and a loss of life from one to one hundred or a hundred and thirty, whatever some of the big accidents have been, we immediately send this great alarm; great public concern arises. Our department of transport investigators, aeronautical experts and people, everything in the country is called in and hundreds of thousands of dollars are spent on what was the cause of this fatal accident on the basis of the machine itself; in other words, the airplane. Now, if we are so concerned about loss of life in air travel, we should be equally or more concerned with the loss of life through inadequacies in vehicles like automobiles, or any other type of vehicle that the public use on a public thoroughfare. For instance, we will have thirty, forty or fifty people killed on a week end but they are killed at various intervals and places over Canada and there does not seem to be the same concern as if they were all killed at one time. Why is there this inconsistency? I think people are becoming aware of the fact that we should pay just as much attention to automobiles, because in the course of a year there are many more people killed in fatal accidents in cars on our Canadian highways than there are in air transportation.

(Translation)

Mr. GOYER: Mr. Chairman, with the good intentions of the mover in mind, would it not be a good idea to take up all bills which refer to the safety of motor vehicles, and study their contents as a whole, all together. In any bill we could take up the best provisions, study them, and then take up and propose a most complete bill, as I said, an omnibus bill for the consideration of the House? It seems to me at first sight, that this Bill is incomplete, and there may be some other bills that are incomplete, but once we have studied them all together, then perhaps we could re-cast them as one and have an overall bill.

(English)

The CHAIRMAN: The reason is, I think, that when we get down to it we will be able to make a report which will tie together the various things which are maybe not at the present time right before us for discussion but which are all related. I hope the report will be a credit to the legal profession; we will deal with it in that way. We will want to make a comprehensive report.

Mr. LAFHAMME: About questions, Mr. Chairman, to Mr. Southam: In your last safety device you say outside rear view mirror of the driver. Are you really sure that this is a safety device? How can outside mirrors be the cause of accidents?

Mr. SOUTHAM: Well, I think the thought here, Mr. Chairman, is that possibly the use of an outside rear view mirror is safer because of its location on the outside of the car. Medical statistics again indicate that when an accident takes place the rear view mirror which normally has been suspended from or fastened to the roof of the car from the inside is in such a position that a person getting thrown against it and therefore suffers a skull fracture, and so on. The rear vision mirror on the outside is in a safer location. I did not go into this in detail but it was one of those safety devices that was listed in what is already considered a safety device in the United States.

● (12:15 p.m.)

Mr. SCOTT: Is it not a fact that the lack of an outside mirror constitutes a blind spot?

Mr. SOUTHAM: Yes.

Mr. SCOTT: You are not suggesting that the inside mirror be deleted.

Mr. SOUTHAM: Well, I am not too sure about that. There is an argument there but I agree with you. I think that we would be better advised to have both, one on the inside and one on the outside. That is my personal opinion.

The CHAIRMAN: Well, if there are no further questions of Mr. Southam, on behalf of the Committee I want to thank you, Mr. Southam, for your presentation and for your cooperation in answering questions. You were of great benefit to the Committee and when we are studying your bill, why, your observations will be considered. Thank you very much.

Now, we have Mr. Wahn with us. He has Bill No. C-49, an act to amend the Criminal Code (Dangerous Motor Vehicles). If it pleases the Committee, I would like to call on Mr. Wahn to present his views in regard to this bill.

Mr. MATHER: Mr. Chairman, it is a little after twelve. I wonder if it would be possible to do that.

The CHAIRMAN: Well, as I said, I left it to the Committee. I would like to have Mr. Wahn proceed if it is possible, but I realize members probably have a timetable and they say, well, I will be through with that committee at a certain hour, and they like to adhere to it. We do not want to lose the benefit of Mr. Wahn's evidence which I am sure will be of great assistance to us all.

Mr. SCOTT: Mr. Chairman, just before we hear Mr. Wahn—I am all for hearing him—I wonder if the Chair would take under advisement some consideration of how we are going to proceed in this field. We will hear the bills, and so on, but then is there not some way we could sort of compartmentalize the hearings; that is, have some sort of timetable of areas of discussion so that we will not endlessly repeat. For example, I would like to see one session devoted to statistical evidence of the problem, of the nature and the number of accidents; lay out the problem that confronts us in the whole field of motor safety. Then, perhaps call in the Minister, of course, but then call in the heads of the automobile companies to see what they are doing.

What I am suggesting, and I am not making myself too clear perhaps, is that we do not wander all over the field every time we have a meeting; that the steering committee try and put it in sections so that for one set of hearings we will deal with a particular aspect of the problem and then move on to something else. Otherwise we will be wandering all over the field every time we have a meeting, and we will not come to any conclusion.

The CHAIRMAN: Certainly, it would be very desirable if we could do it. We have the privilege to hear the sponsors of the bill, and the motion to appear is a plain subject matter from their point of view. What you are mentioning is supplemental. As a result of what they tell us, we may feel we should make inquiries in other quarters. I was hoping that in a good many cases, for example, when Mr. Grafftey appeared and Mr. Mather and supported their respective motions, they will have a lot of this material; that they have got it assembled and that they will not have to go outside this Committee to get it. At

least that is what I am hoping that they will have. They would not be proposing motions unless they did have that information for us. Yes, Mr. Goyer.

(Translation)

Mr. J. P. GOYER: I would even go much further than that. Let us look at the matter of safety belts. If after study it is determined that they are efficient and should be made mandatory on all automobiles, would we really know how to go about it to enact that into legislation? Is it possible, for instance, from the industrial point of view, to have our standards differ from those of the United States? Will car manufacturers be interested in respecting these laws? We can think of a great many laws but first of all we have to find out if they can be actually implemented in all circumstances. That is to say we can very well say this is what is going to happen with regard to automobiles but if we cannot put them on Canadian markets, now then we will be losing face. I am certainly not an expert, I cannot give you an answer on this but how are we going to enforce the law, by what means, and is it possible to differ very greatly and to what extent, from the safety standards that exist elsewhere? That is a basic problem that should concern us before we engage in a discussion as to whether we are going to accept such and such a model of safety belt.

(English)

The CHAIRMAN: Well, I would think that that is something that comes in the report. When you are considering these bills, and these motions, the way you deal with them will be based on the way you are thinking about the different problems. It may be that you will agree it is a splendid idea to do a lot of these things, but that for some particular reason it is not practical to do them. If it comes to law enforcement, why once we make a recommendation, and if it is accepted and becomes part of the law, then it is up to the people who have to administer the law to enforce it. I do not think we would want to recommend approval of the subject matter of a bill that we did not think was an enforceable bill.

Mr. MATHER: Mr. Chairman, in commenting on the point about the need for cooperation between Canada and the United States in safety measures of this type, I think this is a very important area in which we might well question the Minister when he appears before us.

Mr. CHAIRMAN: You have agreed that we are to carry on, have you, gentlemen?

Mr. IAN WAHN (*Member of Parliament*): Mr. Chairman and members of the Committee, I will attempt to be brief because of the hour. I am very happy to have this opportunity to explain to the Committee Bill No. C-49. The purpose of this bill is very briefly summarized in the explanatory note. It is to make it an indictable offence for anyone to manufacture and sell an unsafe motor vehicle for use on a highway.

Now, the discussion this morning has been most useful, because I realize now that my bill is defective in one respect; it should be extended not only to cover those who manufacture or assemble and sell but also those who import and sell. I think it should extend to importers as well.

The bill also makes it an indictable offence for an executive officer or director of any corporation—let me put it this way: The bill provides that an

executive officer or director of any corporation which manufactures and sells such an unsafe motor vehicle is also criminally responsible unless it is established that expert advice has been furnished to such executive officer or director that the model of the motor vehicle in question is reasonably safe for use on the highway.

Earlier this morning, Mr. Chairman, Mr. Bell raised the question whether this type of legislation could properly be considered as criminal legislation, and with the indulgence of Mr. Scott—I took a look at the Criminal Code after this question was raised and it seemed to me section 229 is somewhat similar. It makes it an indictable offence for anyone to send to sea an unseaworthy vessel; although it is not exactly the same it is rather a similar idea and I feel, therefore, that it is not at all unusual to have this type of legislation form part of the Criminal Code.

As all members know, concern about motor vehicle safety has increased greatly in the last few years not only in Canada but in the United States as well. This concern has affected our legislatures. Our legislatures both here and in the United States are considering the question and, in turn, this has had a highly desirable effect I think, upon motor vehicle manufacturers. As you know, in recent months a number of cars which had been sold have been called back by motor vehicle manufacturers for checking and to have defects corrected. I cannot recall this having been done before. I just mention that in yesterday's *Globe and Mail* there is a report that Chrysler of Canada announced that its dealers are recalling about 11,000 cars in Canada for inspection of their front suspension systems. I believe these were cars imported from the United States, which underlines the importance of the change which I think should be made in this bill if it ever comes before Parliament.

Mr. SCOTT: May I ask you a question?

Mr. WAHN: Yes.

Mr. SCOTT: Would the provisions of your bill extend to the sale of used cars, which is where a lot of the real hoodwinking and crookery goes on in the used car field? Would your bill deal with used car sales?

Mr. WAHN: No, it does not go that far, Mr. Scott; it is restricted to those who manufacture or assemble and sell. It would not apply to used car dealers nor would it apply to a new car dealer who just sold. I thought the responsibility should be imposed firmly upon the manufacturer or assembler and also I believe now upon the importer, because they would have the facilities to make certain that the vehicles are made safe, rather than upon the dealer who merely sells the vehicle.

Mr. SCOTT: What do you mean by an unsafe vehicle?

Mr. WAHN: Well, rather than attempt to list specific safety devices, I have left this question to the court, and again I felt that this was not at all unusual. In our criminal legislation there are many instances where, for example, a ship is unseaworthy or not, it is left to the court to decide, based upon all the evidence which is presented to it, based upon whatever expert testimony may be advanced. It seemed to me that this was the most flexible provision that I could introduce.

Mr. SCOTT: Then you are not restricting it to safety features. Your bill would go at mechanically unsound cars?

Mr. WAHN: Yes, my bill would extend to any vehicle which was unsafe for any reason whatsoever, bearing in mind the circumstances in which it is designed to be used, the technical ability of the industry to produce a safe vehicle, the potential speed of the vehicle and that sort of thing. It is not restricted to safety devices; it is more general than that, Mr. Scott.

Now, the increasing concern in recent years is probably due to the extent of the problems involved in automobile safety. In 1965 there were about 400,000 reported motor vehicle accidents in Canada. It is estimated that for every reported accident involving property damage of \$100 or more, there is one not reported because estimated property damage is under \$100. It is estimated that in 1965 the total reported property damage would be about \$120,000,000. In Canada, the statistics show that one traffic injury is recorded every three and a half minutes. Three traffic deaths are recorded every five hours in a year.

It is estimated that in 1965, the total cost of motor vehicle accidents to our economy was close to \$600 million. These figures are taken from a highway accident summary 1965, recently published by the Canadian Highway Safety Council. In the old days young men used to be warned of the dangers of high living and told to avoid wine, women and song. This advice, unfortunately, does not work with regard to automobiles, because statistics show that in 1964 28 per cent of the traffic victims were pedestrians. So it is no longer good enough to be virtuous and to abstain; you have got to be lucky as well to survive.

Mr. MATHER: There are some drunk pedestrians as well, too.

● (12:30 p.m.)

Mr. WAHN: Each year the death toll, the injuries and the economic loss increase. May I give you the figures compiled by d.b.s. for the years 1960 to 1964. First, the reported number of accidents to the nearest thousand: 1960, 248,000; 1961, 267,000; 1962, 311,000; 1964, 363,000, and, as I have said, 1965, almost 400,000. Persons injured, again to the nearest thousand: 1960, 90,000; 1961, 99,000; 1962, 111,000; 1963, 126,000; 1964, 140,000.

Persons killed: 1960, 3,283; 1961, 3,426; 1962, 3,883; 1963, 4,210; 1964, 4,652, and they have increased again in 1965. Perhaps you would be interested in the total property damage, the way it has increased: in 1960 it was \$81,700,000 to the nearest thousand dollars; 1961, \$84,700,000; 1962, \$93,700,000; 1963, \$103 million; 1964, \$118 million and it increased to about \$120 million in 1965.

The population and motor vehicle registrations, of course, increase each year and that is one reason for the increased number of accidents. It appears, however, that the accident rate is increasing at a faster rate. For those who may be interested I have a graph comparing the rates of increase listed under motor vehicles; vehicle miles travelled, persons injured and persons killed. The conclusions are summarized by d.b.s. in a report published in 1963, where it is stated: "Although there were substantial increases between 1961 and 1962 of 16.5 per cent in the total number of accidents, 10 per cent in the number of fatal accidents and 13.3 in the number of persons killed, these increases should be considered in relation to the expanding motor vehicle population and the

increasing use of these vehicles. On this basis total accidents per one million vehicle miles in 1962 increased by 10.2 per cent over 1961 while fatal accidents and deaths per 100 million vehicle miles increased by 4.6 per cent and 7.9 per cent respectively over the same period."

So the accident rate cut off more steeply than would be justified upon the basis of increased number of motor vehicles and increased travel.

In 1965 the bureau reported: "Considered in relation to the increase of 3.2 billion in the number of vehicle miles travelled between 1963 and 1964, the rate of increase of traffic accidents was 1.5 per cent, fatal accidents, 2.8 per cent and persons killed, 4.8 per cent." So this was not quite as bad in the later period. In 1965, I think, the rate of accidents continued to increase not unduly in relation to the increase in the number of vehicles and vehicle miles travelled.

The CHAIRMAN: Apropos of this problem, I understand that we can go on with the evidence even though we have not got a quorum.

Mr. SCOTT: Do not put this on the record.

The CHAIRMAN: It is on the record now. Is that the consensus of opinion that it is quite within our jurisdiction to let the witness complete his statement? Here is Mr. Trudeau now, so we have no problem.

Mr. MATHER: Mr. Chairman, the problem is solved here, but there may be others, including myself who will have to leave shortly. It seems to me that we have made good use of our time with Mr. Wahn and I for one would be quite happy to digest the information he has given us thus far and resume consideration of his bill at our next meeting.

The CHAIRMAN: I do not know if that would appeal to Mr. Wahn. Are you prepared to go ahead?

Mr. WAHN: Anything that is satisfactory to the committee is satisfactory to me, Mr. Chairman.

Mr. BELL (*Carleton*): I do not think we should hurry him.

Mr. SCOTT: No, certainly not.

The CHAIRMAN: Fine, then I will leave the questioning until the next meeting.

Mr. WAHN: The report prepared by the vital statistics branch also states that motor vehicle accidents accounted for the greatest single cause of accidental deaths in 1963; almost 44 per cent of the total accidental deaths. Motor vehicle accidents continue to account for all of the increase in accident fatalities, being the leading cause of death among those 15 to 50 years of age; such is the magnitude of the problem which this committee is considering. It is not limited to any province, it is Canada-wide, and federal legislation would seem to be required. That is why the bill I have sponsored attempts to deal with one aspect of the problem by an amendment to the Criminal Code.

Now, with motor vehicle accidents there are three major elements to be considered: the driver, the road and the motor vehicle. For years emphasis has been placed on educating the driver. And that is as it should be, but nevertheless accidents continue to increase. In the last few years we began to realize the importance of building safety into our highways. Now the time is overdue to

take a long and critical look at the motor vehicle itself. It is almost impossible, of course, to exaggerate the importance of the automotive industry in our economy. Indeed, it powers our economy and is the major provider of employment? Clearly any legislation which is suggested must be responsible and sound.

Since we are moving toward a continental market, our legislation will be influenced to some extent by developments in the United States. Fortunately, however, concern about this problem has been even more evident in United States than in Canada, so I would think that our legislation would move along parallel lines. It seems clear that automobile safety can be increased without any serious danger to the economic health of the Canadian automotive industry. I think this is recognized now by the industry itself. In yesterday's *Globe and Mail* there is a report of a speech made by Mr. Henry Ford who said: "I think it is fair to say that until very recently most of the initiative for the improvement of traffic safety came from the automobile industry. Nevertheless, with the benefit of hindsight, I wish that we in the industry, had done even more, even sooner." He went on to say: "The U.S. auto industry did not act soon enough and vigorously enough to help combat the rising toll of highway accidents." So I think it can be assumed that the automotive industry is aware that something must be done. One reason is that public pressure is coming, as a result of the consideration of this matter, before legislatures and committees such as this.

Could I take just a very few seconds to refer to the brief which one of our colleagues, Mr. Heward Grafftey and others, prepared and published last July, in which it was pointed out that the accident and crash research institute of Cornell University has shown that the leading causes of injury were in order of descending importance: instrument panel, 25 per cent; steering assembly, 21 per cent; windshield, 15 per cent; door structures, 13 per cent; ejection, 12 per cent; backrest of front seats, 7 per cent; top structures, 3 per cent; front corner post, 2 per cent and rearview mirrors, 2 per cent. I think when we consider this type of thing we realize that a great deal of improvement can be made without unduly increasing the cost of motor vehicles.

Some members may have seen the safety prototype vehicle which was on display in front of the Parliament buildings for some time and also in the lobby of the Chateau Laurier. I think most of us who saw it and examined the safety features that were incorporated, felt that many of these could be incorporated by the automotive manufacturers without undue cost and without rendering the vehicles any less attractive.

Turning now to the bill, it proposes a very short and simple amendment to Section 221 of the Criminal Code, which already deals with the dangerous operation of motor vehicles. It would make it an indictable offence for anyone to manufacture or assemble, and sell a motor vehicle for use on the highway if the motor vehicle is unsafe, having regard to all relevant circumstances, including the potential speed of the automobile, the circumstances under which it is likely to be used and the technical ability of the motor vehicle industry to build and equip safe motor vehicles. It seemed to me that this would provide a flexible test capable of adaptation with the development of the industry. In the final analysis, the decision would be made by a court of law which would have the benefit of expert testimony. Courts are accustomed to this type of test.

For years courts have held manufacturers liable in civil actions, in certain circumstances, where they have manufactured defective or dangerous devices. The test can equally be applied in determining criminal liability. Because automobile manufacturers are corporations, it seemed desirable to impose responsibility also on their executive officers and directors, but only fair to give them a defence where they can establish that they have good reason to believe, on the basis of independent expert testimony, that the cars produced by their companies are safe. Again, this is not an unusual provision.

Under our Companies Act and Securities Act, liability has been imposed on directors with protection accorded to them if they can establish that they acted on expert advice and in good faith. I would anticipate, Mr. Chairman, that if this amendment is adopted, in due course independent automobile testing agencies would be developed, perhaps financed partly by grants from the federal and provincial governments and other interested bodies, not including the automobile companies, and that these would make a major contribution to motor vehicle safety. I believe, Mr. Chairman, that the bill is responsible; that it takes a sound approach to a vitally important problem. I hope it will be supported by the committee.

The CHAIRMAN: Thank you very much, Mr. Wahn. I think we have agreed that we will postpone questioning Mr. Wahn or asking him for any further explanations. I do not know whether that would be done at our next meeting but we will have an arrangement with Mr. Wahn and that is understood. I would like to have a meeting of the steering committee after the orders of the day, if that is possible. I see that four members of the committee including myself are here. I know Mr. Woolliams is out of town. Is it agreeable to you, gentlemen, to come to my office this afternoon?

Agreed.

The meeting is adjourned.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 4

TUESDAY, MAY 10, 1966

Respecting the subject-matter of

- Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).
Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).
Bill C-87, An Act to amend the Criminal Code (Impaired Driving).
Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and
Private Members' Notices of Motions Numbers 26 and 31.
-

WITNESSES:

Mr. Barry Mather, M.P., and Mr. Heward Grafftey, M.P.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Honey,	Mr. Otto,
Mr. Asselin (<i>Charlevoix</i>),	Mr. Laflamme,	Mr. Ryan,
Mr. Bell (<i>Carleton</i>),	Mr. Latulippe,	Mr. Scott (<i>Danforth</i>),
Mr. Cantin,	Mr. MacEwan,	Mr. Stanbury,
Mr. Choquette,	Mr. Mather,	Mr. Trudeau,
Mr. Chrétien,	Mr. McQuaid,	Mr. Wahn,
Mr. Fulton,	Mr. Nielsen,	Mr. Woolliams—(24).
Mr. Goyer,		

(Quorum 10)

R. V. Virr,
Clerk of the Committee.

ORDER OF REFERENCE

FRIDAY, May 6, 1966.

Ordered,—That the name of Mr. Latulippe be substituted for that of Mr. Langlois (*Mégantic*) on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House.

MINUTES OF PROCEEDINGS

TUESDAY, May 10, 1966.
(5)

The Standing Committee on Justice and Legal Affairs met at 9.55 o'clock a.m. this day. The Chairman, Mr. A. J. P. Cameron, presided.

Members present: Messrs. Aiken, Cameron (*High Park*), Forest, Honey, Laflamme, Mather, McQuaid, Scott (*Danforth*), Stanbury, Trudeau, Wahn (11).

In attendance: Messrs. Mather and Grafftey, Members of Parliament.

The Chairman presented the Second Report of the Subcommittee as follows:

The Subcommittee on Agenda and Procedure recommends:

(1) That a witness be called from the National Research Council to testify on Breathalyzer Tests.

(2) That a witness be called from the Canadian Bar Association.

(3) That Mr. E. H. S. Piper and Professor Ward Smith representing the Canadian Highway Safety Council be called as witnesses before the committee.

(4) That Dr. Wallace Troup of Ottawa be called to testify before the Committee.

On motion of Mr. Mather, seconded by Mr. Laflamme,

Resolved,—That the Second Report of the Subcommittee on Agenda and Procedure presented this day be adopted.

On motion of Mr. Scott, seconded by Mr. Mather,

Resolved,—That reasonable living and travelling expenses as well as a per diem allowance be paid to Messrs. E. H. Piper and Ward Smith appearing before this Committee in accordance with the scale of expenses approved by Mr. Speaker.

The Chairman called on Mr. Mather who explained his motion No. 26 dated January 20. The Chairman then invited Mr. Grafftey to explain his motion No. 31 dated January 20.

Mr. Grafftey distributed a comprehensive brief entitled TRAFFIC ACCIDENTS AND INJURIES IN CANADA, and a synopsis of the brief.

On motion of Mr. Scott, seconded by Mr. Mather,

Resolved that the Brief and Synopsis presented by Mr. Grafftey be appended to this day's Minutes of Proceedings and Evidence (*See Appendices 1 and 2*).

Mr. Grafftey then expanded on his written brief and was questioned by the Members.

At 11.00 o'clock a.m., the meeting adjourned to the call of the Chair.

R. V. Virr,
Acting Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, May 10, 1966.

● (9.55 a.m.)

The CHAIRMAN: Gentlemen, we have a quorum. Your steering committee met on Thursday, May 5th. I will read the Second Report of the Sub-committee.

See minutes of Proceedings

Is there a motion to adopt this report of the Committee? It is agreed to.

Then I would call for a motion, that reasonable living and travelling expenses as well as a per diem allowance be paid to Mr. Piper and Professor Ward Smith appearing before this Committee in accordance with the scale of expenses approved by Mr. Speaker. Can I have a motion to that effect? The motion is agreed to.

Mr. Wahn unfortunately had another appointment so we will have to defer the hearing and questioning on his Bill and I will call on Mr. Mather to present his brief in regard to his motion.

Mr. MATHER: Mr. Chairman, I think that I can dispose of my presentation in two or three minutes. Resolution No. 26 is very similar to several others that either have been before us or are coming and I would be quite happy to have the Committee pass its judgement on it very rapidly so that we could get on to hear Mr. Grafftey and his much more detailed presentation. I might tell you in all honesty one of my reasons in putting in this resolution in the first place was that I felt that it would at least qualify me, as a man who was interested in this subject, to urge other members who had similar bills and resolutions to see if we could not agree to have all these bills and resolutions come to this Committee, or to a Committee where we could get immediate and concentrated attention on the subject of traffic safety. This is one of my reasons for putting this resolution in.

I could state that the resolution says that in the opinion of this House the government should consider early action to provide or promote legislation having as its aim the inclusion at the manufacturers' level of new and effective safety features in motor vehicles produced or imported into Canada. It is just a simple expression of opinion which I think is in line with several other similar expressions of opinion contained in other bills and resolutions. I do not intend to speak in support of it at all, Mr. Chairman, and whatever the Committee wishes to do about it is quite satisfactory to me. I feel that putting this resolution forward and getting the attention and help to bring this all to this Committee, has been perhaps my contribution towards our aim. It is now before

the Committee for questioning or disposal, as they see fit, of course. I think our time this morning would be better spent hearing Mr. Grafftey's presentation.

The CHAIRMAN: What is the wish of the Committee? Would you like to hear a little bit further from Mr. Mather? I think I would, if he would give us some of the supporting data that he may have on the subject matter as to why he feels this should be considered and action taken on it.

Mr. MATHER: I could give you what I think has already been said in effect by Mr. Wahn in his Bill, also what I am sure Mr. Grafftey will have in more detail. There is no question in my mind that a good many of the traffic casualties which now amount to about 5,000 a year—fatal ones in Canada arise from faulty construction of motor vehicles, and that while this is only part of the overall traffic safety picture, yet I do believe, if there were reforms along the line that were outlined the other day by Mr. Southam and Mr. Wahn, in regard to modernizing and bringing safety features into automobiles, the fatality rates would be reduced. You all have statistics in support of that general idea. I do not think there is anybody who questions it. The point in my mind is how to get some action from the Committee either in a report or in the passage of one of these bills or resolutions to help encourage the government to bring in legislation. I do not see much point in adding to what I am saying, Mr. Chairman.

The CHAIRMAN: Mr. Scott, have you a question?

Mr. SCOTT: I would agree with Mr. Mather. We do not need any more resolutions to tell us what is now an obvious fact. Following the hearings in Washington, which have made this a national issue, mountains of data have piled up showing how the car companies have hoodwinked the public, sold unsafe cars and surreptitiously recalled them without telling anybody what they were being recalled for. It seems to me an irrefutable case has already been made, notwithstanding that we will hear from Mr. Grafftey, that in this whole field we are confronted with a safety problem of the first magnitude, and we should be thinking, it seems to me, in terms of how extensive the problem is, what safety code and regulations are required and how can they be best brought into existence. We do not need too much more evidence to indicate that there is a first rate crisis.

The CHAIRMAN: Does anyone have any other comment? May I take it then, Mr. Mather, that you have placed on the record what you consider the necessary material to support your motion?

Mr. MATHER: Yes, Mr. Chairman.

The CHAIRMAN: Well, then Mr. Grafftey would you mind coming up.

Mr. GRAFFTEY: First of all, Mr. Chairman, I would like to say that although I am not a member of this Committee I welcome and thank you for the opportunity to testify.

The CHAIRMAN: We are very glad indeed to have you, Mr. Grafftey.

Mr. GRAFFTEY: I have no intention, gentlemen, of reading either the synopsis or the text that I presented to you this morning in my testimony, but it is my intention simply to file it with the Committee, and I do hope that both in

the synopsis and in the complete text that I have presented to you you will find a general outline of some of the recommendations that those of us who have been trying to study the matter have put before the government and now are putting before you, the members of the Committee.

I want to be very, very brief and perhaps go over some old ground with you before you ask some questions in relation to my testimony.

I would like, in the next ten minutes, outline briefly the problem, to tell you what we are doing, what I think should be done about it, and why so little has been done up to date.

Gentlemen, what is the problem we are discussing before this Committee now? It is an epidemic. It is an epidemic of massive proportions which in my mind must be met with massive public expenditures and massive public interest. It is an epidemic which in the last year in Canada injured a million people in the year 1965, two-thirds of whom have been permanently disabled, killed five thousand and cost the nation approximately one billion dollars. Multiply that by ten and you have got the United States statistics. Project into the future, to 1970, and you will realize that unless we do something dramatically different in our approach to this epidemic it simply means this, that every second car now rolling off the assembly lines of our nation, as in the United States, will be involved in a death or an injury-producing accident.

First of all, let us make it clear in our minds what is our job as federal legislators. As I said time and time again the provinces have a job to do. On the provincial level we must produce better and safer drivers, better and safer roads and have annual inspections of motor vehicles. This is a provincial responsibility. This job must be continued. But I believe one of the reasons we have made such little advance in controlling this epidemic is that we have left out one of the factors in our discussion, namely the microbe. If you consider the driver as the agent, the roads and the surroundings as the atmosphere, and the car as the microbe, I think you have a picture of this epidemic, in this sense. In my view we have forgotten in the past to talk about the microbe in our approach to the epidemic.

I believe that the federal government has a duty and, incidentally, has the jurisdiction. There seems to be some question now between various departments of government and the Department of Justice where the jurisdiction lies. I believe that the federal government has the jurisdiction to bring the family car, the ordinary everyday automobile, under the rule of law. Aircraft, railway rolling stock, ships, food and drugs are all under the rule of law, and by the same token I believe the federal government has the legal right to bring the automobile under the rule of law.

This epidemic is the third greatest killer of our population, after heart disease and cancer. It is the greatest killer of our young people between the ages of eighteen and thirty-five. Gentlemen, the simple proposition that I put before the Committee today, in its stark nakedness, if you will, is just this, that if the government takes its responsibility and brings the family car under the rule of law immediately, without doing any further research, if the federal government orders the automobile industry to put into the automobile at the

production stage already known scientifically proven safety features, we could immediately reduce this toll in accidents and injuries by about fifty percent. Some people say it is exaggerated. I believe firmly that we can reduce the toll by about fifty percent, that is, if the government orders right now that already known scientific safety features be put into the family car, the automobile, and will thus bring it under the rule of law. Without dramatically putting blame on anyone, let me say that some of these features have been known to the automobile industry for as long as fifteen years and yet they are not in cars now.

Why has so little been done in terms of this whole area? First of all, I said that, in my view, we have cajoled the driver, we have talked about roads, and we have forgotten the microbe in the epidemic. This is one of the reasons I feel so little is being done in terms of controlling the epidemic.

How about research? We know that we are seven to ten times more safe in the air than we are on the roads of our country today. Why? First of all, the building of the aircraft itself comes under strict federal jurisdiction in terms of safety features, as does rolling stock on railways and the building of ships. We know that pilots are only licensed after they reach definite standards of performance and safety. We know that strict federal laws are invoked relating to air traffic, navigation and control. Thus, we see the results.

But apart from that, what happened, as I have mentioned before, in the Ste. Thérèse accident just over two years ago? An aircraft crashed; unfortunately, about one hundred and ten people were killed that night—a tragic accident. Since that time the federal authority alone has spent approximately four to five million dollars trying to research the reason for the crash. And yet, gentlemen, every week on our highways over a hundred Canadians are slaughtered, and within ten or fifteen minutes the morgue wagon goes to the hospital or to the morgue and the wreckage is taken away to the junk pile. Why is not one single cent spent on researching the reasons for this accident? We do not know yet. That is why I recommended in my brief an accident research centre at the federal level. We do not know yet in any real scientific detail what causes these accidents. The automobile industry says: "the nut behind the wheel". That just is not good enough. And so I say that while the aircraft industry has this great record in safety, it is because they spend research dollars and have done something about it. We found out from the testimony before the United States Committee in 1964 when Senator Robert Kennedy cross-examined senior executives, that in 1964 General Motors had a profit of \$1,700 million and they spent but \$1,250,000 on safety research. This is one of the reasons why we have slaughter on our highways.

But let us not go into the area of blame. I have, first of all, talked about the provincial and federal responsibility. We have got to have a balanced approach. We cannot just talk about the car. We have not talked about it at all up to now, as far as I am concerned. One of the reasons that we are having a tough time controlling this epidemic is the lethargy of the public. The public feels: "it can never happen to me; it is something that happens to the other guy". Those of you who are veterans or who have been prisoners during the war, know that very often a fellow could see a fellow prisoner being shot under circumstances

that could easily apply to him, the very next morning, and yet by some quirk of human nature he would bid himself, as we do ourselves, that it could never happen to him. And so because we have a lethargic public, legislators who are unwilling to act and an automobile industry that will not live up to its responsibilities to modern society, we have not made any real headway in controlling this terrible epidemic.

In 1952, for example, we spent many, many times more to control the polio epidemic. There was co-operation between doctors, the public and legislators. But even at that time in 1952, when polio was at its greatest height, the toll in terms of death was only four percent as against the total in highway deaths and injuries. So there is public lethargy. No money is being spent on research, either privately or publicly. What about the highway safety council who were so bitter when I began to discuss the automobile? I am afraid that without getting too dramatic, I must ally myself with my colleague, Ralph Nader, when I say, that the highway safety councils and the safety leagues have done a good job in terms of trying to advocate the building of better roads; they have done a good job in terms of cajoling the driver not to be a "nut behind the wheel", but why do they refuse to discuss the building of safer automobiles? It may be because the government has not done their job in financing these safety leagues, but they draw a lot of their annual funding from the automobile industry, the tire, the oil and the parts industry, in other words, the allied industry. Well, I would say that the Canadian Highway Safety Council get about ten percent of its fee from the automobile industry. If you figure out how much they get from the oil industry, from the parts industry, and all the allied industries, as well as the insurance companies, you would go well over the—

Mr. SCOTT: You are suggesting this is silencing money.

Mr. GRAFFTEY: It is certainly silencing money. And apart from that, it is the only time in the history of the United States that an actual presidential advisory committee had this kind of prestige, we found that the Committee was staffed, financed and backed by industry-oriented people, therefore, they will not talk about the construction of a safer automobile. In Canada to-day, the president of the Highway Safety Council is the Vice-President of the Industrial Acceptance Corporation. One of the vice-presidents of Highway Safety Council is the president of the White Motor Truck Company. Do I need to say any more, gentlemen? I would like you to look at the brochure of the Highway Safety Council and see why these so-called safety establishments patently refuse to discuss the construction of safer automobiles and scream bloody murder when politicians talk about bringing the automobile under the rule of law.

These are the main reasons then why so little has been done in terms of getting legislation passed. In the United States the automobile lobby is absolutely unbelievable and so is the lobby of the tire industry. They go to Washington and say the States should establish the standards. They go to the States and say Washington has the right to create standards. They play both ends against the middle, nothing gets done and they have their way. Consequently, I think one of the great scandals of the twentieth century has been the inability of modern society and modern legislators to bring something as obviously significant as the family car, the automobile, under the rule of law.

What is being done now? I do not have to go over with you the hearings that are going on before the House of Representatives Committee in Washington and that have already taken place before the Senate Subcommittee. At first, we were talking about voluntary standards in relation to President Johnson's bill. It seems very strange that now the industry are very happy about mandatory standards. Beware, gentlemen. The industry are very happy about mandatory standards as long as they can control the body that is developing these mandatory standards, namely, the executive wing of the United States government. And may I suggest to you today that the Secretary of Commerce, who will eventually be responsible for legislating these standards, is an ex-director of General Motors. Now I am not saying that he has not been able to change his views as he passed from industry to government, but my suspicion is that he is largely industry-oriented and that the industry are only too happy that standards are going to be enforced as long as they are enforced by a wing of government that is not going to be too tough. That is why, gentlemen, I point out to you today that this is a job that legislators, and only legislators, can do. It cannot be enforced by the executive wing of government or, in the case of the parliamentary system, by our very able civil service. I do not have to tell you what is going on in Washington anymore, except that I do believe that the standards that are eventually going to come out of Congress will be mandatory standards, but I hope that the legislators are going to have a very great say in what these standards are going to be.

What is happening in New York? New York is the only State in the modern western world which, in my view, has made any real advances in terms of building a "total-type" safety car. They have voted five hundred thousand dollars through their Lower and Upper Houses for a feasibility study. Now, in my view, it is extremely important that such a non-industry body or a public authority build this prototype safety car. Right now, in Canada and in the United States, we have people drafting codes relating to safe driving standards, the building of better roads, and safety features which should go into the automobile for sale to the government and to the general public.

These codes will only be significant if the code drafters have valid data on which to base their conclusions. Up to now, they have to make reference to the industry day and night because they have no research data gathered together by non-industry bodies. Well, the industry, in their answer to me, said: "Look what we have done in terms of the 1967 cars, in the double braking and the collapsible steering column." I am not going to be a killjoy, and I do not want to blame the industry all the time, but supposing the food and drug industry tomorrow morning at nine o'clock told us, as federal legislators, that they had taken a little poison out of our food. We would want to know how much was in our food in the first place, and how much is still left in our food or drug, as the case may be. And we cannot do this unless we have non-industry correlated standards. That is why it is terribly important that a proto-type safety car be built by public authority. If we cannot get this New York State car built, it will be a major triumph for the automobile lobby. That is why Senator Spino was in New York meeting the Minister of Industry. Officials are going to come back in a very few days to meet the people in the National Research Council to see if the National Research Council cannot take a leading part in the completion of this

car and to see if Canada will not offer a few good dollars in getting it built. The Minister is going to be here in a few days to tell us what is going on in terms of code drafting in the Standards Branch of the Department of Defence Production.

Gentlemen, I am not definitive at all on what remains to be done. I have a few ideas in the brief that I put before you. I have said for a long time that the automobile industry in both Canada and the United States should forego the next production year or years costly and unnecessary style changes and devote the money thus saved to safety research.

The New York prototype car must be built. The automobile industry says that a beautiful car and a safe car cannot be built at the same time. They have often said to me: "if you want a safe car, young man, we will build you a tank that will go fifteen miles an hour." I am talking about two things. I am not talking about the inevitability of the accident, I am talking about avoiding accidents in the first place, and if an accident does take place, reducing the possibility of death or injury. I say to the industry: "Since when do proper visibility standards, proper braking standards, proper steering standards, proper door locks, and proper seats designed as they are in aircraft with driver fatigue in mind, detract from the beauty of the automobile?" As regards cars, you will see from our Cornell studies that I believe thirty-eight percent, of deaths are caused by ejection from the vehicle. Since when do proper door locks on cars, the integration of the seat to the frame of the car, the delethalizing of the inside of the car, the proper recessing and padding of dash panels—since when do these improvements detract from the beauty of the vehicle? I say that that argument on the part of the industry is pure bunkum!

Regarding the cost, gentlemen—it will be one of the last things I have to say to you—I believe the industry are trying to say: "Oh, it will be far too expensive." I believe that tomorrow morning at nine o'clock if they put already known features, the forty proven features into the automobile, this would increase the price of the average run automobile by approximately \$100. The automobile industry keep telling us what they cannot do. I believe, in a day and age when we are sending men to the moon, to the planets, into outer space, they can do quite a bit in terms of making real inroads into safety. In pith and substance what has to be done is to bring the automobile under the rule of law and order that the known safety features be incorporated at the production stage. It is as simple as that. I believe that in 1966, when a citizen buys something as dangerous and significant as an automobile, he should get all the safety and the protection that money can buy and that modern technology can and should produce.

The CHAIRMAN: I am sure we are very much indebted to you, Mr. Grafftey, for your vigorous and very effective presentation of the matter which we are considering. We have this brief before us. May I have a motion that it be appended to to-day's proceedings? We also have the synopsis. The brief and the synopsis will then be appended to to-day's proceedings.

Now the witness is available for questioning.

Mr. SCOTT: I have a couple of questions. Mr. Grafftey I am very impressed by your evidence. I take from it you seem to be suggesting to us that there has been, in effect, a sort of gigantic conspiracy against public safety involving the manufacturers of automobiles. The safety councils, you feel, are unduly influenced by them, and by parts of the executive of governments. This interests me because it would mean we were faced with a fantastic, powerful, wealthy lobby attempting to deal with this problem. Can you give us any filling in on that? For example, why is the industry so far behind? You were telling us some of these features have been known for fifteen years but never incorporated into cars. Why?

Mr. GRAFFTEY: First of all, Mr. Scott, the automobile industry in North America was probably the first major industry that really got into the area of planned obsolescence. I would like to preface my reply by saying again that the blame is joint. It is almost one of these classical tragedies. The industry should certainly share part of the blame. The automobile industry is a pioneer industry in planned obsolescence. They got caught up in annual restyling, and they are so busy restyling the vehicle that one of the vice-presidents from Detroit said: "I can sell more automobiles with \$10.00 worth of chrome than with \$100.00 worth of safety." He was as callous as that. A Detroit vice-president said this. They are so caught up in styling that only after the styling considerations are finalized is the safety engineer phoned up, and he is the most frustrated guy in the industry hierarchy to-day. The case in point is the Mustang for 1966, one of the most dangerous automobiles ever allowed on the road in terms of many things. The Mustang is put out by Ford. They had agreed on twelve basic safety features to go into the 1966 Mustang, but in the end, the stylists won out over the safety engineers and they were not incorporated into the car.

Mr. SCOTT: None of them?

Mr. GRAFFTEY: None of them. And we had reason to believe, those of us interested in the field, that this would be one of the major voluntary breakthroughs. This is one of the things that convinced me, Mr. Scott, that the industry will do nothing voluntarily. They are caught up in this tragedy of annual restyling, and it is a terribly, terribly, terribly competitive industry. All of us know this. I think the industry itself would prefer that the standards be enforced rather than be left up in the air, because if you leave the choice to the manufacturers, what one does voluntarily the other might not do and it would upset the competitive balance of one of our major industries. They are much more interested in styling than in safety. I do not believe there has been a North American car built with safety as the chief design criterion. The criterion is styling, what will please the public. How many of us here in this Committee to-day can buy an automobile without consulting our wives? The automobile industry has attacked the advertising media in terms of this sort of thing. Let us not kid ourselves; we in Canada are very snooty about the lobbies in the United States of America. A lobbyist has to register in Washington; he registers as a lobbyist and you know what he is. In the parliamentary system, all you have to do is lobby the Cabinet, forget those guys who are just members of Parliament—and that includes government supporters—and you are home free. The

automobile industry, in the last four months, has been constantly badgering the Government of Canada on the Cabinet level. They have been in their offices—I know it—on this very subject.

Mr. SCOTT: You mean this Canadian automotive industry is lobbying against safety features?

Mr. GRAFFTEY: Certainly. They do not want legislators and politicians to get into this field and tell them to do something they have not been told to do for years.

Mr. FOREST: Mr. Grafftey, could they have changed their minds recently and asked the government to pass mandatory restrictions?

(Translation)

Mr. GRAFFTEY: In my opinion, it could happen because the standards would then be drawn up by the executive branch of the U.S. Government. If the executive draws them up in true co-operation with the industry, then it does not matter if they are mandatory or not.

(English)

Mr. SCOTT: Would you put on the record, Mr. Grafftey, the names of the witnesses and experts that you think would be useful to us?

Mr. GRAFFTEY: Well, I do not know how many other bills and resolutions are going to be brought before the Committee. I have had a very useful chat with the Chairman, and I can only make this offer. I would like to talk to the Steering Committee about it. I have had some very helpful assistance in this whole field; you can be assured by looking at the brief. We have prepared a list of witnesses who we think would be useful to the Committee, in the order in which it might be useful to have them called. I will make this list available to the Chairman and to the Committee, and as I said before, I do not know how long this Committee, as it is set up, is going to be dealing with this particular area of interest, namely highway deaths and injuries as they relate to the resolution and the bills prepared by private members. But I originally thought that this hearing might have come before the Industry and Research Committee about six months ago, and I did instruct my research assistant to prepare what would be a useful list of witnesses to call. I will make available this list to the Chairman.

Mr. SCOTT: And members of the Committee?

Mr. GRAFFTEY: Certainly.

Mr. McQUAID: Mr. Grafftey, do you conscientiously feel that this man who made the statement that \$10 worth of chrome would sell more automobiles than a \$100 worth of safety speaks for the whole automobile industry?

Mr. GRAFFTEY: No. I think it was an off-the-cuff statement. But I think he might have even said it within shouting distance of some reporter who picked it up. Again, I want to say, there are three things I want to emphasize. Talking about the prevention of accidents, the reduction of injury and death when they occur, the danger we are all going to get in this Committee is that we are going to be told we are over-stressing the automobile in the epidemic. We are not. We

are talking about a balanced approach; we are talking about what the provinces have to do, but the only thing we can do in terms of combatting this epidemic is to bring the microbe under the rule of law. So while we must, I think, be very careful not to be accused of an unbalanced approach to the epidemic, we must talk about the cars.

Now I think that the industry, certainly, have their share of the blame in this whole thing. I do not think they are the only ones. I do not want to get involved in the area of blame as I said time and time again but, it is a lethargic public, legislators who have not acted and the irresponsible industry who should all be blamed. As much as I would like to be charitable with the industry, I do feel one of the things those of us who went into the field of responsibility in law are well aware of is that we have in the twentieth century an uncanny knack of delegating blame to someone else. I believe the executives of the automobile industry who have failed to put into automobiles at the production stage—no matter what the public wants or thinks they should have—features that would save lives and reduce injury, are certainly blameworthy.

Mr. MCQUAID: The blame, as I understand it is by reason of the fact that they feel if they put them in and somebody else did not their cars will be a little more expensive, and they are not going to be able to sell them as well. This is why, if these safety features were standardized, then the automobile industry would be perfectly happy to go along with them.

Mr. GRAFFTEY: Yes, I think they probably want this whole thing. Actually, the automobile industry now are getting to the point where I am sure they might be saying: "For heaven's sake, government, make up your mind and act and get this over with." That is why I am telling Mr. Drury the government must act—let us not fool around with it. I got up in the House the other day and I asked the Minister a question. I know he has a ruling somewhere on his desk from the Department of Justice, and I would bet my last dollar that the ruling says that we have the responsibility and the right to act. Are we going to fool around passing the buck between the provinces and the federal government? To me it is patently obvious that we have the jurisdiction, and it is patently obvious that the automobile industry must be getting to the point where they are saying, "O.K. fellows, you are the legislators. Show us the ground rules and we will live by them".

Mr. SCOTT: I have a supplementary question on the point just raised. If the automotive industries are suddenly desirous of mandatory standards, why have they never made any requests, or have they made requests for mandatory standards in the past, knowing, as they do, of these safety features?

Mr. GRAFFTEY: I am sure they have not, Mr. Scott. I think that they have only talked about mandatory standards in the last few weeks when they have become aware that the public are aroused. They are annoyed, and the public want action. Today the North-American public knows that safer cars can and should be built, and they are looking to legislators to take their responsibilities and act. As I said before, because of the tragedy of the annual restyling and the fact that they have gone on this hell bent for leather race, the industry will do nothing unless they are forced to do it. Now they realize they might be forced to do it and they are just lying back and saying: "Force us quickly

because we want to get out of this area into the area of mandated standards and get on with the job", like a kid, you know, who knows he is going to get a licking and wants to get the licking over with.

Mr. AIKEN: Mr. Grafftey, I think that you have indicated your views, with which I personally agree, that we have safety laws governing highway construction, we have safety laws governing driving and drivers, now we should have safety laws governing cars and car construction. There are, as I think Mr. Scott said earlier, mountains of evidence, both in the United States and here, to support that point of view. There is a great lack of safety features on cars. What I am interested in, is what in your opinion would be a good and constructive step for this Committee to take—if we agree with your presentation, and I feel we do—to get some definite tangible action in Canada towards car safety? This Committee has given this matter to date as much legislative consideration as possible.

Mr. GRAFFTEY: First of all, I would like to draw your attention again to the general recommendations we make in the brief. I think we should ask the Minister of Industry to produce his code as quickly as possible for public scrutiny. I would ask that the Canadian government do everything it can to make available National Research Council co-operation for the building of the New York state prototype car. I think this Committee could definitely ask that the government contribute financially to the building of this car. It is not good enough for us to say, "Uncle Sam, you do it", because whatever he does will affect us. I think this is a real area where we can pioneer.

One of the main recommendations in my brief relates to the establishment of National Research Council assistance. I would not want to even paraphrase it but I would like to draw your attention to the brief recommendation. I think it calls for concrete action, without getting down into the details of legislation and whether we could adopt private Members' resolutions. One single thing that Canada can do, I think, is to offer constructive National Research Council assistance in the building of the New York prototype safety car and to offer money in the building of it. I think it would be a great thing if we could clear up the problem by offering money to it before Washington does. Washington is going to, I believe, in President Johnson's Highway and Safety Bill. We were pleading for an amendment to this bill which simply meant federal funding of the New York car. It is going to come one way or another I think. I believe the car is going to be built.

Mr. SCOTT: What is the cost of building the prototype? Is there any estimate?

Mr. GRAFFTEY: Seven or eight million dollars for ten cars. And when those cars are built they will be the first cars crashed in the world that have been built with safety as the main criterion for design features.

Mr. HONEY: Mr. Grafftey, is the objective of the designers of these prototype cars related to proposed standards? In other words, am I correct in assuming that what you hope will come out of these committee meetings or meetings with the United States is that they will be told what is mandatory for the automobile industry? Now do you relate that to the building of prototype cars?

Mr. GRAFFTEY: Yes. Because in my conversations with various executives of the industry I go down a whole series of what I think are obvious safety features, such as integrating the seat to the frame of the car, delethalizing the interior of the automobile, the construction of the car so it crashes in the back and in the front into a properly constructed middle shell. What we are talking about is delethalizing the automobile and protecting the drivers and passengers: delethalizing the interior and diminishing the possibility of exterior objects coming into the passenger and driver area. This is based on two things: it is based on the research knowledge that we have that eighty-seven percent of all death and injury-producing accidents take place under forty-five miles an hour. This was the first thing that directed research people's attention to the vehicle, or the microbe in the epidemic. Once this was established from the Cornell, U.C.L.A. and Harvard studies, they talked about the automobile. Then we went to the industry and we said to the industry: "What about this? What about that? What about taking knobs out of the interior of the car? What about padding your dash panels? What about recessing your dash panels? What about integrating the seats to the frame of the car? What about this? What about that?" The standard answer that I always got was very vague: "Mr. Grafftey, we have no data that shows us this". We have not got this proof. We don't know". It was the most frustrating experience I have ever had in my life. Everywhere I went I would say to them: "Why this? Why that? The Cornell studies tell us this". They would say: "We don't know this. We have no proof of this". The moment you crash a non-industry built car and a car built on feasible design criteria, then you will be able to say to the industry: "You might not know it, we know it. Put it in the car, and we are not going to fool around anymore." We certainly would not let the food and drug industry develop their own standards in their own laboratories. It has to be done by public authority.

Can we not build and develop this prototype safety car? The people who are drafting codes in Ottawa and Washington have nowhere to go for valid conclusions. Now these guys in the Standards Branch of D.D.P. are awfully sincere, but who are they on the phone with everyday, who are down in their offices every day? The engineers of the automobile industry.

In the Canadian Highways Safety Council last week in Calgary—renowned Government experts addressed the Council on the building of safer roads and renowned government experts addressed the Council on the policing of drivers and on the educating of better drivers. Who addressed the Safety Council on the building of cars, or on the annual inspection of cars? Executives from the automobile industry. Where else, in modern society, would we let such a farce continue? And I am not blaming the industry, I do not think they are delinquent but I think we are all nuts to let this thing continue. I do not think any valid standards can be drafted until there is legislation to build this car. Up to now, I have gone to the industry up to the vice-presidential level. What you will see is that if you get a president of the industry in your room and start questioning him, he has a vice-president or a director of engineering with him. And you say: "Why haven't you done this? Why haven't you done that?" And they will say: "We have no proof for it. We don't know." You saw Ralph Nader questioning Nadler from American Motors on "Seven Days". He said: "We don't know." And they said: "Haven't you read the Cornell studies?" They said: "We

can't get them." They got them in the mail. They really do know. We have very very little data, but one of the reasons I think Paul Gikas from Ann Arbor, Michigan should testify before this Committee is that he, as Doctor Moseley did in Boston, actually had a research team photograph cars right after the death producing accidents. He photographed, I think, over a hundred accidents, the interior and the exterior of the automobile. He then got permission from the next of kin to do a reasonable post mortem. Gentlemen if you could see his films and slides! He says: "There is the automobile, the crash took place at forty miles an hour. There is the interior of the car. There is the victim lying in it and that is what killed him. It did not have to be in the car. This is our post mortem." Today, police officers, the minute a death producing accident takes place, are more interested in getting the body in the morgue wagon as fast as possible, the traffic moving and the car moved from the scene of the accident.

(10:45 a.m.)

Mr. SCOTT: And they wait for the next accident.

Mr. GRAFFTEY: And the guy who has done the greatest job in terms of getting semi-sophisticated reports is Shulman in Toronto, who has done some real work. And there are other coroners, to whom we owe a great deal of thanks, who have made their data available to me and who say something more than, "Reason of accident: question mark; rate of speed: question mark; took place, such and such, resulted in accidental death."

Mr. AIKEN: This is something that has puzzled me, Mr. Grafftey, maybe you have some view on it. It seems to me that, financially the people who have suffered most have been the automobile insurance companies, the people who pay the accident claims, the people who have been claiming for the past five years that they are going out of business because traffic is so bad, and they are paying hundreds of millions of dollars in claims for property damage and death on highways. Why have they not been involved in this? You would think that they would be the first and most interested people.

Mr. GRAFFTEY: Well Liberty Mutual of Boston have been. They did quite a pioneering job with Frank Crandell their engineer, not only in car safety but in safety in general. They developed the Liberty Mutual survival car I and II, on which they spent about \$250,000, but, it was not based on safety design. They appended features, one by one, to these cars. By and large—and I think I do not have to go any further—while what you say would seem obvious, on closer examination, some of the insurance companies have this kind of hook-up with the automobile industry so that it does not make it too profitable for them to champion the cars that I feel most of us are beginning to champion.

Mr. AIKEN: Furthermore, they have the excuse for continually increasing their premium, right?

Mr. GRAFFTEY: This could be certainly one of the factors.

Mr. AIKEN: And increasing the volume of both receipts and payments.

Mr. GRAFFTEY: A great body of evidence is beginning to build up, that we are ally the insurance companies with the general automobile industry interest.

Mr. FOREST: We saw here, two weeks ago, at the car show that Italian car. Did that incorporate most of the safety features you are mentioning?

(Translation)

Mr. GRAFFTEY: No, it was only a beginning. We saw in that car at least fifteen safety devices. But the car was brought here, to Ottawa, only in order to give an answer to industry that it is possible to build a car that is beautiful and safe at the same time. I am not saying that it is the last word in everything; it is barely a beginning. There were several safety devices in it, which proves that we can build a beautiful car and a safe car at the same time. That was an answer to the automobile industry. The automobile industry was claiming that we cannot build a beautiful and a safe car at the same time.

Mr. FOREST: Well, I think the public is more interested in beauty than in safety, even if you installed safety belts on the ceiling and so on. I don't even know whether people actually use the safety belts that are installed in their own cars. Will it be asking too much of them to require that a car that would be safe would be beautiful at the same time?

Mr. GRAFFTEY: It is my opinion, Mr. Forest, that public in general is not really kept abreast of all the developments concerning safety. For instance, tomorrow morning at nine o'clock I can tell you that at the minute you fasten your safety belt you will reduce the possibilities of traffic death by 35 per cent and of injuries by 65 per cent automatically. Well, somebody is going to tell you: "Well, there is an exception here." But the figures that we have received show that the minute you fasten your safety belt you decrease the possibility of traffic death by 35 per cent and of injury by 65 per cent. But I think, truly, that the public do not realize this. They do not know these figures. The industry and we, people in the public service, have the duty to indoctrinate, if you like, the public.

(English)

Mr. SCOTT: Mr. Grafftey may I first say that, just by way of preface to my question, you are building such a formidable case of callousness and indifference against the motor companies, that maybe you would better check to see if there are any detectives on your trail, as Mr. Nader had to do in the States, or have you checked? I do not know.

I am interested in your comments on the 1966 Mustang. That is the 66 model year which ends when?

Mr. GRAFFTEY: The 66-model year that ends, well in the Fall.

Mr. SCOTT: Last Fall, is it?

Mr. GRAFFTEY: It was brought out last Fall. Let us see, I hope I have the year correctly. It was brought out last Fall, we are still buying it, and it will be sold until the 1967 Mustang is introduced.

Mr. SCOTT: Well, could you list some of the unsafe features for us?

Mr. GRAFFTEY: I will give you one, just for an example.

Mr. SCOTT: Give us all of them.

Mr. GRAFFTEY: 25 per cent of all deaths and injuries are caused to pedestrians. I might be a percentage point off, but if you will bear with me, I will give you the approximate figure. The Mustang has a front end that will cut a pedestrian in two at 30 miles an hour. Now I am exaggerating, but I ask you tomorrow morning to go down and see a Mustang parked in the parking lot, run

your finger across it and ask yourself one question: Would you rather be hit at an intersection with the front end of a reasonably designed car, with pedestrian safety in mind, or the front end of this Mustang? This fact was drawn to the attention of the stylists, and they knowingly let that front end be incorporated into the car. But I do not like to single out any one car. The hardtop General Motors cars, for instance, are so designed that you or I cannot properly incorporate the three point shoulder harnesses, whereas the slightest engineering change in the General Motors hardtop would have permitted us to use the three point belt. Now I mean simply, Mr. Scott, that there are few people who are using the three point belt but they would if they knew how safe it was.

Mr. SCOTT: Would that information be available to the manufacturers as well?

Mr. GRAFFTEY: Oh, yes. Every automobile stylist and his design engineer know that while the lap belt is a fairly good item to have and use, it is not nearly as good as the three point belt properly installed. You can not even install it in the General Motors hardtop, but you could with the slightest engineering change.

Mr. MATHER: Mr. Grafftey, along the same line of thought, is there any substantial difference in safety in today's cars, in the cars we know about? Is there a car that is relatively safer than other cars?

Mr. GRAFFTEY: It would be unfair to get into that area right now. As Mr. Nader points out, some cars have better door locking features than others. But in the balance, it would seem that all of the industry are more or less equal. You have all read about the cars that are safe automobiles. We do know that the hardtop, because of roll-over, is more dangerous than the ordinary sedan, and you will find the statistics on roll-over, in my brief, are quite incredible. The convertible is obviously a much more patently dangerous car to be driving in. But one of the things that is becoming obvious, in the statistics we have gathered, is that the man in the light car is much less safe. The minute you have a really, really light European car, you are approximately doubling your chances of death or injury, not because it is, per se, more unsafe. In Europe, they are probably just as safe as we are in our cars in terms of basic design, because when you crash in Europe, you are going to crash probably, against another small car. Mr. Scott and Mr. Mather, if you were in an American designed automobile and you hit me in a Volkswagen, you will walk away and I will be creamed. And this is why statistics tell us, in the North American situation, that the light car driver is in a double ratio in terms of accident or death potential.

Mr. SCOTT: In what way could this be corrected?

Mr. GRAFFTEY: Well, I think this is the sort of thing we could discuss. I think it is going to be hard to correct that feature, Mr. Scott. I would be irresponsible if I got too much into the area of the technique.

Mr. MATHER: You have said, Mr. Grafftey, that we have all heard about safe cars. I have not, I must confess. I think I read somewhere that the Volvo is considered to be a relatively safe car, but this is the only knowledge I have of it.

Mr. GRAFFTEY: The Rover, it has been said in various magazines, that the Rover cars do incorporate many, many safety features. Now whether it was by design or luck, those who are more technically oriented than I am can better say.

The proof that we now have now, before us, Mr. Scott, is that safety is a rich man's luxury. The big expensive car is a heavy car, and I am not saying they are safe cars, but you are obviously more safe in a heavy car. The rich guy is more likely to be driving a more operational car. Statistics tell us that the low income fellow driving a second hand car on secondary rural highways is really driving with some of the great danger factors.

The CHAIRMAN: Now, it is eleven o'clock—

Mr. HONEY: May I ask one more question?

The CHAIRMAN: Yes certainly, go ahead.

Mr. HONEY: Mr. Grafftey, you mentioned in your remarks that the federal authority has jurisdiction in this matter. I have not considered this matter, but to me it is not obvious. Have you any authority on the matter?

Mr. GRAFFTEY: Well, I will give you my general ideas. Can we try to look very briefly at two stages? Let us say that this is an unoccupied field. Let us tackle it from the practical, as opposed to the legalistic point of view. Can anybody here imagine, in the practical 1966 society, the provinces entering into this field? I do not think you can. This makes you suspicious that they do not have the jurisdiction.

Mr. HONEY: Perhaps they are disinterested.

Mr. GRAFFTEY: Certainly, it is not all that pleasant a job to have to do. They are not only disinterested, but from a practical point of view, if you had the provinces doing this, the industry would just love it. The minute you say the provinces have the right to do it, you will have the industry going to the provincial level and lobbying for different standards in different provinces. Confusion will exist, and you will never get a uniform standard across the nation. This is how they have been able to withhold action in the United States, especially in tire standards. It would be a good thing for this Committee to consider some tire standards. The United States tire industry yelled and yelled for years for a uniform standard for tires, and they said: "Gentlemen, just give us uniform standards and we will do it". But what they were actually doing, just working with the large States, was to press for different standards at different State levels. Confusion reigned, and they went home and had a ball. From a practical point of view, I just cannot imagine anybody believing that it is only the federal government that can act in this regard.

Now from a legal point of view, let us admit that right now it is a vacant field that it not filled up. I believe that according to our constitution, when you have a vacant field, the first guy that fills it has it. Apart from that, from a practical point of view, going down to a third legal argument, I think you could look at the regulations relating to food and drugs, go back into the jurisdiction on liquor, and read some of the Supreme Court cases, you will see

that it is the federal government that makes laws regarding aircraft. I think by corollary and analogy, you could argue that the way we treat aircraft should apply to cars.

Mr. HONEY: Are there not any legal opinions on this matter?

Mr. GRAFFTEY: I think we are getting into a pioneer field, here.

The CHAIRMAN: Gentlemen, the Public Accounts Committee is due here at 11 o'clock and signalling at the door, so I think we will have to adjourn.

Will you be available next Thursday with the film Mr. Grafftey? The meeting is adjourned.

APPENDIX "1"

FULL TEXT OF BRIEF
ON
TRAFFIC ACCIDENT DEATHS AND INJURIES IN CANADA
PREPARED AND PRESENTED TO THE FEDERAL
GOVERNMENT OF CANADA

Heward Grafftey, M.P., Lawyer
C. Alexander Brown, Writer
Rheal Casavant, Television Executive.

OTTAWA, CANADA—JULY 2, 1965.

INTRODUCTION

Significant new developments in the understanding of the complex casualty of motor vehicle fatalities and injuries have prompted us to set down our knowledge and understanding of this problem, together with three recommendations for remedial action that could be taken at the federal level, for presentation to the Prime Minister of Canada, the Minister of National Health and Welfare, the Minister of Justice, the Minister of Trade and Commerce and the Minister of Industry.

This Brief has been endorsed by:

C. E. DIONNE, M.P.

House of Commons, Ottawa

STANLEY KNOWLES, M.P.

House of Commons, Ottawa

Guy Marcoux, M.P., M.D.

House of Commons, Ottawa

JOHN MATHESON, M.P.

BRIEF ON AUTOMOBILE SAFETY

In the past ten years 35,031 people have been killed in automobile accidents in Canada, and 948,850 injured. It is estimated that by the end of 1965, 4,800 more will die and 150,000 will be injured. If the present trend continues, between the beginning of 1966 and the end of 1970, 26,000 more Canadians will die on our roads and more than one million more will be injured.

Accidents are now one of the leading causes of death and injury in this, as in many other countries. It is estimated that about *half* of all cars in North America between the time they are first driven and the time they are scrapped become involved in at least one injury-producing accident.

To the present time nearly all efforts to correct this situation have been directed at drivers. In spite of this, the toll of death and injury continues to increase and there is *absolutely no* evidence to indicate that to continue to expend most of our efforts in educating, cajoling, and penalizing the driver will yield adequate results. The problem of highway death and injury must be attacked in other areas. In modern times, the techniques of epidemiology have been successfully "extended from its original restriction to the communicable diseases to a broad application of mass diseases of man; to cancer, diabetes, congenital anomalies and many others. It is not so generally appreciated that injuries, as distinguished from diseases, are equally susceptible to this approach, and that accidents as a health problem of populations conform to the same biological laws as do disease processes and regularly evidence comparable behaviour".

Epidemiological Approach

Applying the terminology of epidemiology to automobile accidents, the roads are the environment, the driver is the host and automobiles are the agents. Drivers (the host in our terms) are susceptible to human error. Therefore, there will *always* be accidents. We should try to protect drivers from the *effects of their inevitable errors* by building cars (the agents) in such a manner as to offer a large measure of protection against possible injury to occupants. The evidence indicates indisputably that automobile injury and death could be very significantly reduced approximately sixty percent if safety features *already tested and known* were incorporated into the design of automobiles.

We should not cease trying to improve the environment of this "epidemic", i.e., the highways, nor the performance of host—the driver—but priority should be given to de-lethalizing the "agent". *The driver* is the most rigid factor in the complex—road, car, driver—and the one least amenable to change. But we *can* change highways to some extent, and we *could* change cars.

Research on Injury and Fatality

Research on injury and fatality

Research done at the Accident and Crash Research Institute of Cornell University has shown that the leading instruments of injury, including fatal injury, were, in order of descending importance²:

	Approx.
Instrument Panel	25%
Steering Assembly	21%
Windshield	15%
Door Structures	13%
Ejection	12%
Backrest of Front Seat	7%
Top Structures	3%
Front Corner Post	2%
Rear View Mirror	2%

The same study showed that the main causes of death were:

	Approx.
Ejection	36%
Steering Assembly	17%
Instrument Panel	12%
Windshield	12%
Door Structures	9%
Front Corner Post	6%
Top Structures	6%
Backrest Front Seat	1%
Rear View Mirror	1%

Research done by Doctors Donald Huelke and Paul W. Gikas of University of Michigan Medical School³ confirms this. *Seventy-two percent* of all automobile crash fatality results from injury to the head⁴.

Research on automobile safety and design is being carried on at many centres, among them the University of California at Los Angeles, University of Minnesota, Wayne State University, the Liberty Mutual Insurance Company of Boston, and of course by the car manufacturers themselves. In addition, aircraft manufacturers, many agencies of government in the United States, and the Armed Forces, have sponsored or conducted massive studies on aircraft design and safety. Many of these studies are directly applicable to automobile design. In spite of this great wealth of material, however, the automobile companies have not given design of safety features priority and have largely ignored recommended modifications that would reduce the increasing toll of dead and injured. The attitude of the auto manufacturers is still that of the Detroit Vice-President who said: "Ten dollars of chrome will sell more new cars than one hundred dollars of safety features⁵." This is especially ironic in view of the fact that much of the independent research on safety and design is supported by the car manufacturers. This, however, might be just good public relations, for it has long been possible for example, to make steering assemblies which will not impale drivers whose cars collide.

The aircraft industry years ago, after studies of pilot errors, adopted standardized instrument positions and the shape coding of knobs. Still today the same model cars will have their instrument positions changed from one year to the next at the behest of style.⁶ The value of shoulder harness has been known for years. *The auto companies themselves* use them in crash tests. They have yet to be offered to the public as standard equipment.

Disc brakes are demonstrably far safer than the standard drum brakes, yet up to 1965 they have been offered only as optional equipment on *some* 1965 models, for reasons of sales and "prestige"!⁷

Criticisms of the auto companies have been mounting steadily in recent months as more and more people become aware of what could be and is not being done by the auto manufacturers to protect them.

In April of 1965 Walter P. Reuther, President of United Auto Workers, sent a letter to the Presidents of American Motors Corp., Chrysler Corp. and Ford Motor Company which stated in part: "as part of our common interest in the welfare of the industry, there goes a joint responsibility to the public that buys, or is affected by, the products manufactured in our plants by our members. Increasingly, that public is becoming concerned about the health and safety effects of automobiles."

To counter this growing criticism, the auto companies have launched a massive public relations campaign. Newspaper and magazine articles inform us of the research they are now doing and have been doing. Recently articles in various magazines have informed us that by 1967 cars will have recessed knobs on dashboards, large rear view outside mirrors, stronger door locks, dual braking systems, and uniform bumper heights. But these changes are being made *only* because the United States General Services Administration required that these and some other safety features be incorporated in all cars bought by the Government by 1967. Furthermore, these recommendations, which are, in the view of many doctors and scientists concerned about automobile safety, inadequate and diluted, have been pending for three years, and had to be fought for.

In addition, bills dealing with auto safety are pending in thirty American State Legislatures. So there is justification in asking whether these changes—which have been forced on the auto makers—are not being widely touted to forestall the passage of stringent legislation. For experience shows that the manufacturers, obsessively concerned with sale and styling, will make significant safety changes only when forced to do so. The now standard—and inadequate—two front seat lap belts were adopted only after the Legislatures of New York and several other States passed laws requiring seat belts.⁸ Anti-smog and combustion fume devices are being installed on all cars only because California passed laws making them compulsory.⁹

People who would otherwise have survived automobile accidents have been killed when tool boxes and spare tyres hurtled from their car trunks through the *cardboard* trunk walls and into the passenger compartment, breaking backs

and crushing torsos.¹⁰ Cardboard is *still* the material used to make the forward trunk walls of cars, sometimes with the addition of two thin metal cross members.

The list of correctable and dangerous shortcomings in today's cars is a long one. Nothing—no statements, no acts—emanating from the auto companies encourages anyone to believe that any great improvements will be volunteered by them. For example, they have, in their design of automobiles, completely ignored the concept of 'second collisions' derived from research done at many centres, and most notably at the Transportation and Traffic Engineering Centre of University of California. When a car collides and comes to an instantaneous stop, the driver and passengers (and also toolboxes and spare tyres in the trunk) continue to travel at the speed of the car before collision, and strike the inside of the car and each other with *exactly* the same force with which, say, a pedestrian standing in the path of the car would be struck by the car moving at its pre-collision speed.

Eighty-seven percent of traffic accidents and *forty-five percent* of traffic fatalities occur at speeds *less than forty miles per hour*. In many of these accidents the forces that tear seats loose, wreck the passenger compartment and smash occupants against each other and the interior of their cars like eggs in a barrel are of smaller magnitude than the human body could tolerate if properly protected. It is no longer even difficult for automotive engineers to build this protection into cars.⁽¹³⁻¹⁷⁾

Survival Prototype Cars

The Liberty Mutual Insurance Company of Boston with its "Survival Cars" and Pinifarina of Italy with its beautiful prototype safety car body, the Pinifarina "Sigma", have demonstrated that it is possible to design and build cars that promise considerable reduction of the risk of death and injury through ejection, collision with the unpadded or inadequately padded interior of the passenger compartment, intrusion of the inflexible steering wheel shaft into the driver area, and crushing of the passenger compartment.

Recommendations

In view of all the above, plus additional facts as stated hereunder, we urge the Federal Government to:

(1) Make provisions to establish, perhaps within the National Research Council, a Research and Development unit that would develop a prototype safety automobile that would:

- (a) offer the maximum protection against injury to automobile passengers in the event of accidents;
- (b) have the highest possible standard of braking, stability, manoeuvrability, driver visibility, and such features as would mitigate against the occurrence of accidents.

This prototype safety car would not be merely a modification of existing automobile design, *nor* would it be built on a commonsense judgment, but would be based on solid research, including research done for aircraft

and applicable to automobiles, and research done at various universities in the United States, plus other similar work being carried out in other countries.

(2) We further urge that there should be established as either a part of the above research unit, or separate but working closely with it, a committee made up in substantial part of scientists, engineers and doctors, which would keep abreast of research and advances affecting automobile safety carried on and made by universities, various auto companies and elsewhere. This committee would, from time to time, make recommendations to the government that, within a specified but reasonable time, all automobiles made in Canada or imported into Canada must have specific devices, systems or features—or their equivalent—complying with the committee's recommendations. This jurisdiction should extend over all components of automobiles, including tyres. It is urged that this committee, and the government in ruling on the recommendations of the committee, limit themselves to minimum performance specifications only, and not write mechanical specifications. For binding specifications other than performance specifications have the effect of limiting advances. Two examples of this area:

- (i) When the flashing turn signal was developed as a replacement for the semaphore arm type of turn signal, its adaptation was hampered by the fact that traffic laws in a number of places specified that turn signals should be the semaphore type.
- (ii) Changes in headlamp shape that could possibly improve night time visibility are being hindered by laws in many places specifying that automobile headlamps be round.

Federal Control

At present the Federal Government does not exercise any control over automobiles having to do with safety. Control over ownership and operation of automobiles is exercised by the Provinces. But there is no reason why the Federal Government could not exercise control by setting specifications for manufacture and importation. There are already agencies of government protecting Canadians by control of, among other things, food and drugs, shipping, railroads and aircraft manufacture and usage. There is every reason for the same sort of control to be exercised over automobiles.

Today the problem of death and injury caused by automobile accidents is more urgent than other problems currently receiving more attention; probably because it is still widely believed by the public that all that can be done is being done. But this is not the case. Until fairly recently, the problem of accidents, and specifically automobile accidents, had not attracted the attention of serious scientific investigators. The Harvard Medical School "Research on Fatal Highway Accidents" project was the first large scale study of its kind to attract wide attention.

One of the first things that the Harvard Medical School researchers discovered was that the word "accidental" is not the correct word to apply to many highway collisions, injuries and deaths, for chance is *not* the dominant

factor, and our fatalistic acceptance of injury and death as a necessary price that we must pay for widespread use of automobiles is unjustified—and deadly. This view serves as an automatic barrier to intelligent observation concerning the problem. For a great deal can be done—with cars, with highways, with road signs—but mostly with cars. This has been confirmed and reinforced by research.

(3) We further urge that the Federal Government take steps to establish, perhaps as a Branch of the Department of National Health and Welfare, or the National Research Council, a National Accident Prevention Centre, staffed with scientists from a wide spectrum of disciplines—physicians, psychiatrists, psychologists, toxicologists, engineers, physiologists, etc.—who would:

- (i) Carry on extensive and detailed investigations as to causes of accidents;
- (ii) Establish an information centre;
- (iii) Promote and co-ordinate related research in other places such as hospitals and universities;
- (iv) Make recommendations to:
 - (a) industry;
 - (b) governments at all levels on regulations and laws to prevent and reduce accidents.

Although traffic accidents would be a major area of concern for this National Accident Prevention Research Centre, it would not be its only major area of concern.

It is to be expected that any attempts to regulate automobile design and safety will be opposed with all the skill that the great wealth and power of the automobile manufacturers can afford. There is precedence for this in history. The Plimsoll Line for ships was opposed, as were air brakes for locomotives, and safety precautions for miners. When New York State Senator Edward Speno tried to have a bill setting minimum safety specifications for automobile tyres adopted by his State's Legislature, he reported that the tyre companies launched against his bill the strongest lobby he had ever seen mounted in Albany. In Washington, the Federal Trade Commission held hearings in January 1965 on automobile tyres. The hearing revealed what Senator Gaylord Nelson called a "national scandal in tyres", including the fact that size stamped on tyres do not give actual size and were never intended to. Ply label ratings have no understandable meaning. Automobile tyres for six-passenger cars have their specifications based on a load of three passengers and no luggage in the trunk. What is significant here is that the testimony of the hearings have, as of this writing, not yet been printed and published so that the public can readily buy copies. Anyone wanting a copy will have to pay \$496.00 for a typewritten transcript.

We urge that in this matter the Government consider not only the arguments that will be raised by the auto companies, but also the views of such experts as Dr. Alfred Moseley who conducted the Harvard University program; Dr. William Haddon of the New York State Department of Health; Mr. David Klein of the U.S. Association for the Aid of Crippled Children; Mr. William I. Stieglitz, chief of Design Safety and Reliability, Republic Aviation Corporation;

Col. (Dr.) John P. Stapp of the United States Air Force Medical Corps; Dr. James L. Malfetti of Columbia University; Professor James Ryan of University of Minnesota; Mr. Frank Crandall of Liberty Mutual Insurance Company; Dr. Paul Gikas of Veterans' Administration Hospital, Ann Arbor, Michigan; Dr. Donald F. Huelke, University of Michigan Medical School; Dr. Fletcher D. Woodward, University of Virginia Medical School; Drs. B. J. Campbell and Robert A. Wolf of Cornell University's Automotive Crash Injury Research Centre; Dr. James L. Goddard, United States Federal Aviation Agency; Dr. John Lane of the Australian Department of Civil Aviation.

Finally, we urge that at least serious feasibility studies of our proposals be initiated.

Conclusion

Canadians should be assured that when they buy something as expensive, important and potentially dangerous as an automobile, they are getting the greatest measure of protection that science and technology can offer.

During 1952, the worst year of the polio epidemic, the number of people killed by polio was less than 4% of those killed by automobile accidents. Yet the efforts made to combat polio exceeded by several hundred times the efforts made to reduce highway deaths. Furthermore, the efforts to reduce highway deaths continued in the same old groove. Surely if the problem was as simple as the safe driving slogans indicate, we would by now be on the way to a solution. But we are actually moving in the opposite direction. The time is long past for the abandonment of useless and dangerous presumptions. In this age, when on an average downtown street in an average North American city on any week-day, an average driver has to make a decision that could result in his—or someone else's—death about once every fifty seconds, and the traditional approaches to this serious problem are obviously inadequate, it is necessary to move in new directions. Slow evolution has no value when its cost is paid daily in pain and death.

APPENDIX "2"

From the Office of
Heward Grafftey, M.P. (Brome-Missisquoi)
House of Commons—Ottawa

Synopsis of a Brief Presented
Friday, July 2, 1965

to the Prime Minister of Canada, the Rt. Hon. Lester B. Pearson
Regarding Automobile Safety

Prepared and Presented by:

Heward Grafftey, M.P., Lawyer
C. Alexander Brown, Writer
Rhéal Casavant, Executive

Endorsed by:

Patricia Burwash, Writer
C. E. Dionne, M.P., Union Representative
Stanley Knowles, M.P., Printer and Minister
Joseph Koenig, Film Producer
John Matheson, M.P., Lawyer
Guy Marcoux, M.D., M.P.
Wilson Southam, Television Producer

In the past ten years 35,031 people have been killed in automobile accidents in Canada, and 948,850 injured. It is estimated that by the end of 1965, 4,800 more will die, and 150,000 more injured. If the present trend continues, between the beginning of 1966 and the end of 1970, 26,000 more Canadians will have died on our roads, and more than 1,000,000 injured.

Automobile accidents are now one of the leading causes of death and injury in this, as in many other countries. It is estimated that about *half* of all our cars are going to be involved sooner or later in injury-producing accidents.

To the present time nearly all efforts to correct this has been directed at educating, cajoling and penalizing the driver. *There is no evidence* to indicate that this will yield any significant results.

There is a considerable amount of evidence, gathered by researchers at many universities, which indicates indisputably that many lives, now being lost, could be saved if safety features already tested and known were incorporated into the design of automobiles.

Research done at the Accident and Crash Injury Research Institute of Cornell University show that the *main instruments of injury, including fatal injury were*, in order of descending importance:

Instrument Panel	25%
Steering Assembly	21%
Windshield	15%
Door Structures	13%
Ejection	12%
Backrest of Front Seat	7%
Top Structures	3%
Front Corner Post	2%
Rear View Mirror	2%

The same study showed that the main causes of death were:

Ejection	36%
Steering Assembly	17%
Instrument Panel	12%
Windshield	12%
Door Structures	9%
Front Corner Post	6%
Top Structures	6%
Backrest Front Seat	1%
Rear View Mirror	1%

Research done at University of Michigan Medical School confirms this. Research on Automobile Safety and Design is being carried on not only by many universities, but also by the auto companies themselves. In addition, a good deal of the results of massive studies done on aircraft design and safety is applicable to automobile design. Auto Companies largely ignore this great wealth of material and *refuse to make recommended modifications that would reduce the toll of death and injury*. Sales and styling, not safety, has priority, and the general attitude is that of the Detroit Vice-President who said: "Ten dollars of chrome will sell more new cars than one hundred dollars of safety features." Criticism of the auto companies has been increasing in recent months as more and more people become aware of what *could be* and *is not* being done to protect the public. To counter this, the auto manufacturers have launched a massive public relations campaign. Safety features that have been *forced* on them by the U.S. Government's General Services Administration which purchases 50,000 vehicles each year, are now being widely touted, perhaps in an attempt to forestall the bills dealing with auto safety now pending in thirty U.S. State Legislatures. Experience shows the *auto companies make safety changes only when forced to*. We have yet to be offered disc brakes and harness type seat belts as standard equipment, and it has been possible for years to make a steering assembly that would not, in a crash, impale the driver. People are still being killed by spare tires and tool boxes that crash through cardboard trunk walls to break backs and crush bodies. It is said that 87 per cent of traffic accidents and 45 per cent of highway fatalities occur at speeds less than 40 miles per hour.

In view of all the above, we urge the Federal Government to:

(1) *Establish a RESEARCH AND DEVELOPMENT UNIT that would seek to develop a prototype safety car that would offer passengers the maximum protection against injury in the event of accident, and have the highest possible standards of braking, stability and such features as would mitigate against the occurrence of accidents. This prototype safety car would not be merely a modification of existing car design, nor based on a priori commonsense judgment, but upon solid research and scientific analysis.*

(2) *We further urge that A COMMITTEE made up in substantial part of scientists, engineers and doctors be established to keep abreast of research and advances affecting automobile safety. This committee would from time to time make recommendations to the government that within a certain specified reasonable time all cars manufactured in or imported into Canada have such specified devices or systems—or their equivalent as would make cars safer. Jurisdiction should extend over all components including tires. These specifications would be minimum performance specifications only and not mechanical specifications as mechanical specifications tend to limit advances. At the present time, the Federal Government does not exercise any control having to do with safety over automobiles. Control over ownership and operation of automobiles is exercised by the provinces. But there is no reason why the Federal Government could not exercise control through setting specifications for manufacture and importation. There are already agencies of government protecting Canadians through control over, among other things, food and drugs, housing, shipping, railroads and aircraft manufacture and usage. There is every reason for the same sort of control to be exercised over automobiles travelling throughout Canada.*

(3) *We further urge that the Federal Government take steps to establish a NATIONAL ACCIDENT PREVENTION RESEARCH CENTRE, staffed with scientists from a wide spectrum of disciplines—physicians, psychologists, engineers, toxicologist, psychiatrists, etc.—who would carry on extensive research as to all types of accidents, establish a central information centre, promote and co-ordinate research in other places, and make recommendations to industry, the public and governments at all levels. Traffic accidents would be only one of many major areas of concern for this NATIONAL ACCIDENT PREVENTION RESEARCH CENTRE.*

We believe that Canadians should be assured that when they buy something as expensive, important and potentially dangerous as an automobile, that they are getting the greatest measure of protection that science and technology can offer.

The traditional approach to this serious problem is obviously inadequate and it is necessary to move in new and entirely different directions. Tradition and slow evolution has no value when we pay for them daily in pain and death.

Cost varies according to Committees.

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 5

THURSDAY, MAY 12, 1966

Respecting the subject-matter of

Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).

Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).

Bill C-87, An Act to amend the Criminal Code (Impaired Driving).

Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and

Private Members' Notices of Motions Numbers 26 and 31.

WITNESSES:

Mr. Ian Wahn, M.P. and Mr. Heward Grafftey, M.P.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Honey,	Mr. Otto,
Mr. Asselin (<i>Charlevoix</i>),	Mr. Laflamme,	Mr. Ryan,
Mr. Bell (<i>Carleton</i>),	Mr. Latulippe,	Mr. Scott (<i>Danforth</i>),
Mr. Choquette,	Mr. MacEwan,	Mr. Stanbury,
Mr. Chrétien,	Mr. Mather,	Mr. Trudeau,
Mr. Fulton,	Mr. McQuaid,	Mr. Wahn,
Mr. Goyer,	Mr. Nielsen,	Mr. Woolliams—(24).
Mr. Guay,		

(Quorum 10)

R. V. Virr,
Clerk of the Committee.

ORDER OF REFERENCE

WEDNESDAY, May 11, 1966.

Ordered,—That the name of Mr. Guay be substituted for that of Mr. Cantin on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House.

MINUTES OF PROCEEDINGS

THURSDAY, May 12, 1966.

(6)

The Standing Committee on Justice and Legal Affairs met this day at 11.15 o'clock a.m. The Chairman, Mr. A. J. P. Cameron (*High Park*) presided.

Members present: Messrs. Aiken, Asselin (*Charlevoix*), Bell (*Carleton*), Cameron (*High Park*), Choquette, Chrétien, Forest, Honey, Laflamme, Latulippe, McQuaid, Trudeau, Wahn—13.

In attendance: Mr. Grafftey, M.P. and Mr. Rheal Casavant, Television executive.

The Chairman informed the Committee that Mr. McQuaid had replaced Mr. Woolliams on the Subcommittee on Agenda and Procedure.

The Chairman further informed the meeting that Dr. Wallace Troup would appear before the Committee on May 19 and Professor Ward Smith and Mr. E. H. S. Piper, representatives of the Canadian Highway Safety Council would appear on June 7, 1966.

The Chairman then invited the members to continue questioning Mr. Ian Wahn, sponsor of Bill C-49—An Act to amend the Criminal Code (Dangerous Motor Vehicles).

Following this, the Chairman invited Mr. Grafftey, M.P. to present a film on Motor Vehicle Safety. After brief introductory remarks and after presenting his colleague, Mr. Rheal Casavant, a film produced by the National Film Board entitled "Every Second Car" was shown to the Committee.

There being no further questions the meeting adjourned to the call of the Chair.

R. V. Virr,
Clerk of the Committee.

EVIDENCE

THURSDAY, May 12, 1966.

● (11.14 a.m.)

The CHAIRMAN: Gentlemen, we have a quorum. We will get right down to business. I have a letter from Mr. McQuaid indicating that he will serve as a member of the steering committee during Mr. Woolliams temporary absence. I also have a letter from Mr. Farmer, executive director of the Canadian Highway Safety Council, in which he advises that Mr. Reid Scott has told him that this Committee is studying the problem of highway safety and expresses the hope that the council will have an opportunity of discussing that subject matter with the Committee. In that connection, we have Dr. Troup as our witness on May 19. The Clerk of the Committee has been in touch with Professor Ward Smith of Queen's Park and Mr. Piper, who is the counsel for the Canadian Highway Safety Council, and they will be available as witnesses on June 7.

Our next meeting will be Thursday of next week and, in the meantime, I will try to arrange if possible, to have a meeting with the Minister of Industry for probably Wednesday or Friday of next week. Mr. Ian Wahn is here. We were discussing his bill two meetings ago. We did not have an opportunity to question him and that opportunity is now available. If you have any questions on Mr. Wahn's bill he is here prepared to answer them. Mr. Wahn's bill No. C-49, an Act to amend the Criminal Code (Dangerous Motor Vehicles) provides for a penalty for "any person who manufactures or assembles and sells or otherwise disposes of any motor vehicle intended for use on a highway which is not built and equipped with safety devices so as to make it reasonably safe for use on the highway." I think that is the real essence of the bill, is it not, Mr. Wahn?

Mr. Ian WAHN (*Sponsor of Bill C-49*): Plus the personal liability on the directors and officers.

Mr. FOREST: Mr. Wahn, by not supplying the safety devices to be incorporated in motor vehicles and having in mind the relevant circumstances you mentioned, such as the technical ability of the motor vehicle industry to build and equip safe motor vehicles and with the potential speeders, do you not think the amendment to the Code is quite general and in practice it would be very difficult to get a conviction under it?

Mr. WAHN: I would agree that the language is very general. I think it would be quite possible to get a conviction, though. The purpose is to retain flexibility and not attempt to specify today just how a motor vehicle should be built because with the development of the industry and with the change in road conditions, no doubt there will be improvements made from year to year. So I

thought it best to leave the language general. The court would decide whether or not a motor vehicle or a particular car is reasonably safe for use on the highway. Courts are accustomed to making decisions of this sort.

Just as an example, in the Criminal Code now there is a provision which makes it a criminal offence to send an unseaworthy ship to sea and there is no attempt made in that particular section of the Criminal Code to define specifically when a ship is unseaworthy. Similarly, I think it should be a criminal offence for a manufacturer to send an unsafe motor car out on our highways. I think the court would be able to determine whether in fact a car was unsafe, on the basis of expert evidence that would be presented to the court.

The CHAIRMAN: Did you check to find out if there were any charges laid under the Code having to do with unseaworthy vessels?

Mr. WAHN: I did not check and I did not bring my copy of the Criminal Code with me, Mr. Chairman. My recollection is that there were some annotations under that particular section, but I could not be absolutely certain.

Mr. BELL (*Carleton*): I would like to comment, Mr. Wahn, on the respective approaches of your own bill and that of Mr. Southam. He took the approach of actually defining safety devices; whereas you have left it presumably to broaden down from precedent to precedent. Why do you think your approach is preferable to that of Mr. Southam and what weaknesses may there be in Mr. Southam's bill in regard to his approach?

Mr. WAHN: I would think that if you attempt to specify today what safety features a car should have, it would be probably necessary to keep amending the legislation from year to year. Presumably, cars should be made safer each year, and when all the devices which Mr. Southam has listed in his amendment have been adopted, then presumably there will be improvements which should be added and it would be necessary then to keep amending the Criminal Code from year to year. If you go general, then I think the section would not require amendments so frequently.

Mr. BELL (*Carleton*): I gather that you would wish now to have your bill amended to include the importation of cars.

Mr. WAHN: Yes, that was an oversight on my part. It should clearly be extended to cover one who imports and sells.

Mr. BELL (*Carleton*): What about exports?

Mr. WAHN: I had not given any thought to the question of one who exports. I suppose if you cover one who manufactures and sells—I think that probably the wording of the bill as it now is, is wide enough to cover one who exports because it covers those who manufacture and sell. It is not restricted to those who sell within the country. So, presumably, it would cover one who manufactures and exports.

Mr. McQUAID: It would seem Mr. Wahn that this particular bill is not wide enough to cover the case of a man who sells a second hand motor vehicle. Is that right?

Mr. WAHN: That is right. That seemed to me to be a different type of problem. Perhaps something should be done about that but, the difficulty that I

saw was that it would be very very difficult to impose this type of criminal liability on an ordinary distributor of motor vehicles because he would not have the facilities to determine whether a particular car is safe. His job is to sell cars which are produced by the manufacturer. It seems to me that the responsibility should be on the manufacturer. The second hand dealer is another matter. I do not know just what you can do about that problem.

Mr. McQUAID: Do you not think that is an important problem. Second hand cars on the road should be equipped with safety devices, too. A very simple change in the wording of your bill, I think, would cover it.

Mr. WAHN: What change would you suggest?

Mr. McQUAID: That any person who manufactures or assembles and sells, or sells or otherwise disposes of any motor vehicle.

Mr. WAHN: That would mean that a distributor of new vehicles would also have this same criminal responsibility. I wonder if that is practicable? If you could impose the liability on the manufacturer, I think it would cover automatically all the distributors of new vehicles. I realize it is a rather different problem in knowing how to deal with those who sell second hand vehicles which may be in bad condition. Perhaps the bill could be extended specifically to cover the distributors of second hand motor vehicles.

Mr. AIKEN: Mr. Wahn, I would like to follow up Mr. McQuaid's question because I think it is very important. Perhaps, as you say, the distribution and sale of second hand vehicles is a different problem, but it is aimed toward the same difficulty. Perhaps another section in your bill, or splitting it into two sections, would be useful, because it would then impose some liability on dealers who sell vehicles that are in that condition. There are a lot of them and mostly they are people who are well qualified in the condition of motor vehicles. And, if it were never checked for brakes or things like that—this is quite a slightly different problem, granted, but I think it is all part of road safety.

Mr. WAHN: I would be inclined to think it should be a separate subsection because I think it is somewhat different. I believe you are talking about second hand motor vehicles. You are thinking probably of motor vehicles which are defective in the parts. We are not thinking so much of the original design of the vehicle as to a vehicle which may be defective in its parts. I think that is a different type of problem which could be dealt with in a separate subsection.

Mr. AIKEN: Then it would be still part of the same problem, that is unsafe vehicles on the highway.

Mr. WAHN: Yes, and I can see some merit in imposing a liability on second hand car dealers to make sure that the parts of the car as it exists when it comes into his hands are at least put into good condition. I do not see how you could hold the second hand dealer responsible if the car which he bought from someone else—as originally designed—was unsafe. That is why I say it is a rather different problem.

Mr. McQUAID: There seems to be another weakness in this bill, Mr. Wahn. You are putting the liability of course on the manufacturer to equip these cars with safety devices, but you are not making any requirement for the owner,

after he acquires the vehicle, to continue to keep it equipped. For example, if one of the safety devices breaks down should there not be some requirement that it has to be replaced on the vehicle?

Mr. WAHN: I had not considered that particular point, but now that you have raised it, it appears to me that—the owner is liable, of course, if he drives an unsafe vehicle and hurts someone or causes property damage. Your suggestion would mean that we impose additional criminal liability on him perhaps to force him to protect himself as well as others. Primarily this bill is directed toward those who manufacture motor cars or assemble them. As I say, it should also be extended to those who import them. I was not thinking in terms of imposing criminal liability upon the owner of an unsafe motor vehicle. That would be going much further.

The CHAIRMAN: Did you examine the provincial laws with regard to the safety of automobiles? I am not referring to safety devices, but just that they are in good road condition without regard to whether they have safety devices, good brakes, good lights and things of that kind?

Mr. WAHN: I have not examined the provincial legislation specifically, Mr. Chairman. I assume, however, that civil liability is imposed upon anyone who—

The CHAIRMAN: This is really criminal liability.

Mr. WAHN: Yes.

Mr. HONEY: Mr. Wahn, following the Chairman's suggestion—this may be in the nature of a supplementary—and with reference to the suggestion of Mr. McQuaid, of imposing liability on the seller of second hand cars, we must keep in mind the danger or probability of running into a constitutional problem, with this bill, because it would seem to me you would be extending the application of this bill which may be all right constitutionally now because you are confining it to manufacturers, or assemblers and sellers of original motor vehicles. But if you attempt to impose a liability on the seller of second hand motor vehicles who has, in effect, no responsibility for manufacture or for putting safety devices on vehicles you may be in conflict with provincial laws. I wonder if that is what the Chairman had in mind. It may have the effect of spoiling your bill?

● (11.30 a.m.)

The CHAIRMAN: Well what I had in the back of my mind is that they could be supplementary. Provincial law provides for the roadability of the car, as a car *per se* and not particularly the safety devices. A car is not allowed on the road unless it is in good condition. I know in a number of American states they have laws which state that every four or six months you have to take your car to a service station and have it checked over to see if it is in good running condition, and these are old cars in many cases. I would take it also that any bill proposing criminal liability on a manufacturer or assembler and so on would be effective only from the date it became law. If a car was manufactured before that, I do not think you would have a good defence.

Mr. FOREST: Mr. Chairman, would it be a good idea if we had the subcommittee deal with all the private bills that have been presented regarding the safety of motor vehicles and try to redraft a bill with the co-operation of all the sponsors, which could include—

The CHAIRMAN: Well, I do not know whether it would be within the terms of reference to consider that problem. I think when the Committee sits down to draft a report and when a similar principle is involved we will consider them in toto and make our recommendation on the general consensus of opinion. I think Mr. Choquette has some questions he would like to ask you, Mr. Wahn.

Mr. WAHN: Would you prefer that I come up there, Mr. Chairman?

The CHAIRMAN: Yes, that probably would be better.

Mr. CHOQUETTE: We are discussing all the subjects and they are all related. I do not know if you could redraft them.

The CHAIRMAN: Well, as I say, that is something we would have to consider. Specific bills and specific motions are referred to us. We are asked to study the subject matter. Now, if we draft a new bill or suggest amendments to them, we may be going beyond our terms of reference. We consider the subject matter of a bill, then if we have any suggestions, we could think about these things, A. B. or C. or whatever they are which might be considered as improvements.

(Translation)

Mr. CHOQUETTE: Mr. Wahn, I know that this is an improvement in relation to the bill which we studied last week because it is specified in the draft of your bill that this applies to motor vehicles intended for use on the highway. Two weeks ago, I had raised an objection in connection with the bill that we were studying. There mention was made only of the manufacturers. There was no specification with regard to the aim for which this motor vehicle was manufactured. That was too broad.

However, Mr. Wahn, I must ask the following question now as I re-read your bill. I wonder what can this really add to the Criminal Code. I do not think it adds anything at the present stage of our legislation because if someone were actually to manufacture or sell a car which was not reasonably safe, then I wonder whether we could have recourse to those sections which deal with criminal negligence because we would be putting other peoples lives in jeopardy if those vehicles were not sufficiently or reasonably safe. So here I would rather tend to agree with Mr. Forest and the others, that is to say that if we do not describe the safety devices required then the scope of the bill is so broad that action could be taken under sections 191 and others which deal with criminal negligence. Whenever a car is manufactured—I mean a car which is intended for use on public highways—when such a car is sold to someone and is not reasonably safe, then we are truly affecting other people's lives and there your bill does not add anything because the Criminal Code already deals with this question of other people's lives. Only the person who manufactures a car which is not reasonably safe could be said to endanger other people's lives and be proceeded against under section 191 and subsequent sections. What would your answer be to this?

(English)

Mr. WAHN: I would hope that this bill would add something to the existing provisions of the Criminal Code. It is true there are sections which make criminal negligence a crime but this new provision is much more specific and I

think would make it entirely clear to a court that criminal liability is being imposed upon a manufacturer where he manufactures a car which is not reasonably safe, having in mind the specific circumstances which are referred to in the bill.

For example, the motor vehicle must be built and equipped with devices—not just equipped with safety devices but designed and equipped with safety devices so as to be reasonably safe having regard to the relevant circumstances including the potential speed. In other words, this type of thing I think, would make it entirely clear to a court that a new crime is being created, namely, a crime which is committed when a manufacturer produces a vehicle which having regard to these circumstances, is not safe for use on the highway. As I mentioned earlier, there is now a provision in the Criminal Code which makes it a crime to send to sea an unseaworthy ship. That is a general term, too and it seems to me that if it is practical to impose criminal liability where someone sends an unseaworthy ship to sea, it should equally be feasible to make it a crime for someone to manufacture an unroadworthy car.

(Translation)

Mr. CHOQUETTE: We could have special provisions for aircraft, trains, etc, I understand the shade of meaning that you are introducing but would you not think that it would be useful to describe a standard vehicle? The court will have to refer to some standard vehicle, they will have to have some kind of fully specified criteria in order to enable them to pass sentence and convict people.

(English)

Mr. WAHN: I would expect a court would ask the assistance of an expert and would be guided to some extent by expert advice as to whether a particular car was designed in a safe way. The objection that I have to any attempt to specify safety devices is simply that as other safety devices are adopted your section becomes obsolete. For example, seat belts will soon be standard in all cars.

(Translation)

Mr. CHOQUETTE: My last question. The only thing is that I am afraid that if this were adopted the present state of affairs will in no way be modified. I for instance have a Ford, a 1966 model, I am sorry, it is a 1965 model, and in the mind of Mr. Grafftey this car would not have the ideal safety devices that Mr. Grafftey would like to introduce. Well what shall I do? Shall I sue my salesman? I am sure he will be able to justify the sale of that car to me, he could say that it is perfectly safe. In other words, I think that your bill is so general in scope that it does not add anything to the present state of affairs. That is my comment. If we do not introduce in the Criminal Code a standard model, a specifically described model of a vehicle which is supposed to be fully safe we will not be adding anything. Thank you.

(English)

Mr. WAHN: I would not suggest that the wording of the bill as I have drafted it is ideal. I wanted to avoid a specific list of safety devices for the reasons I have given. By making reference to all relevant circumstances,

including potential speed, conditions under which it is likely to be used and the technical ability of the motor vehicle industry to design safe motor vehicles, I tried to give some indication to the court in rather general terms, as to the type of thing they should consider when a crime is alleged. Now, if there is other general language which would be more appropriate, I certainly would be delighted to be informed of it and perhaps the wording could be improved. I do think the wording is adequate to create a new offense.

The CHAIRMAN: are there any more questions?

(Translation)

Mr. LATULIPPE: Mr. Chairman, I think there should be a clear difference in the bill between new and used cars, since, on old cars you cannot expect to have the same safety devices as you have on new cars. I agree with those, such as Mr. Graftey for instance, who have done a great deal of homework on this, that in new cars we must introduce changes that safety devices must be introduced to make cars as safe as possible, and give more safety to consumers. After all vehicles are built to provide transportation for us and they perform very well but they are not built to withstand accidents. In particular imported cars are just like accordions. Some do not even have a chassis, and they fold up like accordions to crush the people inside.

So certainly measures must be taken, something must be done and manufacturers must improve their cars, whether they are imported or manufactured in Canada. Certainly improvements can be made with regard to safety. I cannot find any great fault with cars from the point of view of performance or braking power or anything else, but safety devices should be introduced. All I can say is that from the accident aspect certain improvements must be introduced and it might be possible to require, under the law, that such cars be built in order to absorb shocks in case of accident. In particular, with regard to imported cars, there are no safety devices whatsoever.

(English)

Mr. WAHN: I agree this bill of mine should be extended to cover imported cars. That is a defect of the bill at the present time.

The CHAIRMAN: Mr. Forest, did you have a question?

(Translation)

Mr. CHOQUETTE: If we were to take your bill as it is, Mr. Wahn, the person who drives a Volkswagen certainly is not as safe on the highway as the one who drives a Cadillac. Well is the Volkswagen manufacturer liable to conviction under this section? I think it would be very difficult. . . It is obvious, of course, that any time a Volkswagen has a collision, somebody's life is endangered.

(English)

The CHAIRMAN: We are going to have a very interesting time when we come to write our report, because there is going to be a difference of opinion as to the merit of the subject matter of the bills. When we do get down to that stage, then we can consider just what to report back to the House for their consideration. Are there any other questions of Mr. Wahn?

I forgot to mention—it was brought up at our previous meeting by Mr. Grafftey himself—that Senator Magnuson, who was the chairman of the Senate commerce committee, might be considered as a suitable person to appear before this Committee. You will realize that if we wanted Senator Magnuson to appear, we would have to do it through the Department of External Affairs. We cannot ask a statesman from one country to come and give evidence in another country unless he gets clearance from his own country. Mr. Martin has indicated to me that if the Committee felt that it wanted him, and could see an advantage in calling Mr. Magnuson, he would be glad to take the necessary diplomatic steps to see that our invitation was properly extended. You might let me have your opinion on that.

● (11.15 a.m.)

Mr. BELL (*Carleton*): My understanding of the suggestion is that there should be liaison between yourself, sir, and Senator Magnuson as to the adequacy of the procedures and the suggestions that he might have, not that he might come as an expert witness. I wonder if, in fact, Senator Magnuson, for whom I have high regard, would be sufficiently expert in the circumstances. He is sitting, as you are, listening and I would have thought it would be better to hear from witnesses we had here than some person who sits in a semi-judicial capacity.

The CHAIRMAN: Have you any comments to make on that, Mr. Grafftey?

Mr. GRAFFTEY: I might comment very briefly when I am called upon to present my brief.

The CHAIRMAN: We will, then, leave it at that for the time being.

Mr. AIKEN: Mr. Chairman, just before we go on, Mr. Choquette raised a question and I think it was an important one—I do not know whether Mr. Wahn intended to answer. I rather believe he did—and that was the question of the relative safety of vehicles and whether or not he has any intention, in his bill, of saying, “a Volkswagen is not as safe as a Cadillac”. I think this would be a very bad approach. I think the purpose of his bill is to make every vehicle reasonably safe and to provide that there will be no inherent dangers in it. I think once they put it on the road, the duty has ceased. I wonder if Mr. Wahn would like to answer that question. I think it was a good one.

Mr. WAHN: It was a good question. As I understood it, Mr. Choquette referred, not to cars which are now on the highway, but to cars which would be manufactured after this bill came into force. The question was whether the manufacturer of a Volkswagen would have to take care to make it just as safe as the manufacturer of a Cadillac would. I think the answer to that is it is recognized that there is merit in having cars of different sizes. If this bill came into effect, all that could be expected would be that a small car was reasonably safe, bearing in mind the fact that it was a small car and, therefore, perhaps inherently not as safe as a much larger car. The bill does specify that the vehicle must be safe, having regard to the relevant circumstances. I would think the size of a car is one of the relevant circumstances. I do not know whether, in fact, a Volkswagen is any more dangerous than a Cadillac or whether size gives

safety or not but I think we must recognize that we will always have cars and motorcycles of different sizes on the road and unless you want to prohibit altogether cars of a certain size, all we can do is require that they be as reasonably safe as their size would permit.

(Translation)

Mr. LAFLAMME: I only have a single question to ask of Mr. Wahn. The general idea I find is a very good one but I would really like to know how we can describe a crime or an offence without going into the details as to what actually is an automobile which is built in a reasonably safe way. We have no description of what is, what is a reasonably safe car. How then can we establish a new offence? What is a reasonably safe car?

(English)

Mr. WAHN: I think that expert evidence would be of great assistance to a court. For example, most of the articles which are now being written about the safety of the prototype cars, are being produced to illustrate safety features. These indicate, for example, that it is quite obvious that a collapsible steering wheel is desirable because many injuries are caused by the rigid type of steering wheel we have now. The rounded exterior surfaces are probably desirable also, well padded interiors, reset instrument panels, reset door handles and better locking devices on the doors. Experts can be of great assistance to a court.

Mr. CHOQUETTE: Then you agree that your bill has to define safety devices?

Mr. WAHN: No, I take the position that it is undesirable to attempt to list safety devices as they will change from year to year. I believe that a court is quite accustomed to applying the test of what is reasonable, under the circumstances. The court is called upon to do this every day in criminal cases, as well as in civil cases, and I find nothing unusual at all in it, particularly when the court will be assisted by expert evidence.

Mr. CHOQUETTE: But you know how experts are? They will bring other experts to say that the other experts are wrong and—

Mr. WAHN: That is true. Then the court makes its decision. I think it is quite customary for both sides to have experts giving evidence in direct conflict. The court somehow makes a decision because it is forced to make a decision.

(Translation)

Mr. CHOQUETTE: In other words, you rely a great deal on jurisprudence to clarify your bill?

Mr. TRUDEAU: What about a car which is a "provident head of the family", as we would say in the Civil Code. That is the idea I have of a car like that.

Mr. CHOQUETTE: Because you see, Mr. Wahn, if someone drives a Volkswagen on a highway, it could be said that safety belts are necessary. But I feel personally that a seven passenger limousine is just as safe without safety belts as a Volkswagen carrying two or three seat belts. We have here no specific

description or any standard established of what are security or safety features. This being the case, then I think that we are really not dealing with anything concrete.

(English)

The CHAIRMAN: Gentlemen, tempus fugit. If there are no more questions which are urgent, we will thank Mr. Wahn very much for his presentation of his brief and for his bill and for the very full and complete answers he has given to the various questions. Thank you very much, Mr. Wahn.

We will have the film and I am going to ask Mr. Grafftey to make a few opening remarks.

I am informed that the commentaries are in both French and English. I think probably that those who will be following the French commentaries, with greater ease, are in the majority. Therefore, if it meets with approval, we will have the commentaries in French. Those who would like to have them in English will have to stay and hear it a second time. I do not think they will.

(Translation)

Mr. GRAFFTEY: Before we show our film, I would like to make a preliminary comment. I would like to point out that we have with us, Mr. Rhéal Casavant of the CBC, and I would publicly like to thank him for the considerable research he has been carrying on over the past two years on the subject before us. I would like to take this opportunity Rhéal, to thank you publicly before this committee today for the major efforts you have made over the years with regards to public safety.

● (12.00 noon)

Now dear colleagues we will present our film "every second car" which discusses the germ of the epidemic which we discussed several days ago and which is still before us.

The commentary we will hear is in English to begin with.

Mr. CASAVANT: The film is in English, but we also have a French film.

Mr. GRAFFTEY: These are bilingual accidents.

(English)

I would just like to say very briefly that I have with me today Mr. Rhéal Casavant from Radio Canada who helped me—and helped many people who are interested in this field—to prepare the text that we presented to the Prime Minister a year ago.

I would like to say very briefly, with all due respect, that what we have found out in our first Committee here, is that expert witnesses are going to be terribly important. What I say to the Committee today, before we see the film, is simply this. There is a body of very expert opinion on the whole subject distributed across Canada. Rhéal, to my right here, has worked indefatigably for

two years. He has a list of approximately 30 or 40 witnesses who he feels should be called in that order. Not that this Committee is going to be able to do that, maybe you are going to set up another Committee. I can only tell you, gentlemen, that the United States Congress had the same experience and their subcommittee in the Senate met for a year on the subject—this one subject. The subcommittee in the House of Representatives is going to meet for approximately two years. It would be my hope that this Committee on Legal and Justice Affairs, even under the Canadian system, could meet for an indeterminate period of time to hear about this most important subject. If not, I do hope the procedure will be developed whereby the witnesses can be called before this Committee or another committee that is set up. I cannot over-emphasize the importance of having expert witnesses on the legal aspect, the engineering aspect and the ethical aspect of this subject.

Before showing the film, I think it is very interesting and very important that I do bring this to your attention, at this time, especially in view of the fact that Mr. Wahn has just testified so well. Mr. Wahn's bill and the questioning pointed out this morning that we really do not have a body of information to draw on. Mr. Wahn purposely drafted his bill the way he did because we can make no beginning point in terms of definite public standards to the building of automobiles. Gentlemen, again and again I draw your attention to the synopsis of our brief where we mark out one, two, and three. We urge the federal government to establish a research and development unit that would seek to develop a prototype safety car. Mr. Wahn, in due respect sir, you spoke about safety cars that are being built. None are being built. The motor car industry has stopped the building of any. We have no valid point of beginning from which to base contingents for co-drafters or anything else. We just do not have it. We do in aircraft design; we do in ship design; we do with railroads, but there is no prototype safety car being built today. So that is why I say, number one, we should urge the government to get on with the building of such a prototype safety car by public authority. It is spelled out in our recommendation.

Then we urge that a committee, made up in substantial part, of scientists, doctors and engineers, be established to keep abreast of research and advances affecting automobile safety. All these standards would be decreed by public authority on which a bill, like Mr. Wahn's, would be very useful eventually. Then we go on to urge in number three, that a national accident prevention and research centre be established. We know nothing about why people get into car accidents and when they do why they get killed or injured. So the usefulness of such legislation or resolutions that we are discussing today will only be proven when we take these preliminary steps. That is why, before we show the film, I draw your attention to the recommendations in the brief.

I cannot over-emphasize the second step, and I am afraid I am repeating myself especially on this subject, which is the calling of expert witnesses in a logical organized way, either before this Committee or before a subcommittee you set up. I would recommend that Mr. Casavant work hand in hand with the Chairman and the permanent committee members in order to do movies of this sort.

Note: At this point a half hour film was shown with commentaries.

The CHAIRMAN: Before we adjourn, I think we would like to thank Mr. Rhéal Casavant for coming and presenting this film. It has been a real education to me and I know by the attention the members have given, that it has been a real education to them too. Thank you very much, Mr. Casavant and thank you, Mr. Grafftey, for making this possible.

The meeting is adjourned.

OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE

This edition contains the English deliberations
and/or a translation into English of the French.

Copies and complete sets are available to the
public by subscription to the Queen's Printer.
Cost varies according to Committees.

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 6

THURSDAY, MAY 19, 1966

Respecting the subject-matter of

Bill C-26, An Act to amend the Criminal Code (Safety Devices for
Automotive Vehicles)

Bill C-49, An Act to amend the Criminal Code (Dangerous Motor
Vehicles)

Bill C-87, An Act to amend the Criminal Code (Impaired Driving)

Bill C-118, An Act to amend the Criminal Code (Negligence in opera-
tion of motor vehicles), and

Private Members' Notices of Motions Numbers 26 and 31.

WITNESS:

Dr. Wallace B. Troup (retired).

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Guay,	Mr. Nielsen,
Mr. Asselin (<i>Charlevoix</i>),	Mr. Honey,	Mr. Otto,
Mr. Bell, (<i>Carleton</i>),	Mr. Laflamme,	Mr. Ryan,
Mr. Choquette,	Mr. Latulippe,	Mr. Scott (<i>Danforth</i>),
Mr. Chrétien,	Mr. MacEwan,	*Mr. Tolmie,
Mr. Fulton,	Mr. Mather,	Mr. Trudeau,
Mr. Goyer,	Mr. McQuaid,	Mr. Wahn,
		Mr. Woolliams—(24).

(Quorum 10)

R. V. Virr,

Clerk of the Committee.

*Mr. Tolmie replaced Mr. Stanbury on May 16.

ORDER OF REFERENCE

MONDAY, May 16, 1966.

Ordered,—That the name of Mr. Tolmie be substituted for that of Mr. Stanbury on the Standing Committee on Justice and Legal Affairs.

Attest

LÉON-J. RAYMOND,
The Clerk of the House.

REPORT TO THE HOUSE

THURSDAY, May 19, 1966.

The Standing Committee on Justice and Legal Affairs has the honour to present its

SECOND REPORT

Your Committee recommends that it be permitted to sit while the House is sitting to meet the convenience of out-of-town witnesses when they appear.

Respectfully submitted,

A. J. P. CAMERON,
Chairman.

(Concurred in May 25, 1966)

MINUTES OF PROCEEDINGS

THURSDAY, May 19, 1966.

(7)

The Standing Committee on Justice and Legal Affairs met at 9.45 o'clock a.m. this day. The Chairman, Mr. A. J. P. Cameron, presided.

Members present: Messrs. Aiken, Bell (*Carleton*), Cameron (*High Park*), Choquette, Forest, Goyer, Honey, Laflamme, Mather, McQuaid, Otto, Ryan, Tolmie (13).

In attendance: Mr. Howard Grafftey, M.P.

Also in attendance: Dr. Wallace B. Troup, retired.

The Chairman informed the Committee that the Minister of Industry, Mr. Drury, would attend the next meeting of the Committee to explain his department's activity in developing an Automotive Vehicle Safety Code.

The Chairman introduced Dr. Wallace Troup, retired. He explained that Dr. Troup had been active in the field of highway safety over the past twenty years and that he could be considered as an experienced witness in the field of Breathalyzer Tests.

Dr. Troup reviewed his background in the field and then covered the reliability and accuracy of Breathalyzer Tests, whether they should be mandatory or not and, if so, what arbitrary blood alcohol levels should be set.

The Chairman mentioned that out-of-town witnesses would be called before the Committee and that the Committee should consider a request to sit while the House is sitting.

Moved by Mr. Forest, seconded by Mr. Honey,

Resolved,—That the Committee recommend that it be permitted to sit while the House is sitting to meet the convenience of out-of-town witnesses.

And the questioning of the witness continuing.

On behalf of the Committee the Chairman thanked the witness for his interesting presentation.

At 11.17 o'clock a.m. the Committee adjourned to the call of the chair.

R. V. Virr,
Clerk of the Committee.

EVIDENCE

(Recorded by electronic apparatus)

THURSDAY, May 19, 1966.

The CHAIRMAN: Gentlemen, I see a quorum. We will now commence the meeting.

I have received from the Co-ordinator of Committees a note which reads, in part, as follows:

The Chairman should announce each speaker's name clearly so that it can be recorded. In some cases statements are being wrongly attributed because the voice of the speaker cannot be identified. Members should be cautioned to speak towards the microphone on the table. In some cases statements are being lost because speakers turn from the microphones or lean back in their chairs.

I have been in touch with the Minister of Industry, and he can come to a meeting tomorrow morning at 9.30.

I would like to have an expression of opinion from those who are here on whether they can attend such a meeting, or whether they, in the absence of any notice of it, have made other arrangements? Mr. Aiken has told me that he would probably not be able to be here.

Mr. AIKEN: Well, actually the Penitentiaries Committee is going down to Cowansville tomorrow with Mr. Pennell.

The CHAIRMAN: What about you, Mr. McQuaid? You cannot be here either?

Mr. MCQUAID: I cannot be here.

The CHAIRMAN: How about you, Mr. Bell?

Mr. BELL (*Carleton*): I will be away tomorrow.

An hon. MEMBER: There are a couple of committee meetings tomorrow, Mr. Chairman. That is my only concern.

The CHAIRMAN: Well, I will check. I am not going to ask the Minister to be here if I am not certain that I can get a quorum.

Now, it is my pleasure to introduce to the meeting Dr. Wallace Troup formerly of the Canadian Medical Association. He is an expert on the subject matter of impaired driving, with particular reference, I believe, to the validity of the breathalyzer test. Dr. Troup will tell you his qualifications on the subject that he is going to discuss with you, and I believe he has prepared a memorandum which he intends to read.

We also have another distinguished guest in the audience, Air Vice Marshal Kerr, who is executive director of the Traffic Injury Research Foundation. We welcome him to our meeting and we hope that he will derive benefit from it.

Dr. WALLACE TROUP: Mr. Chairman and gentlemen, I am very happy to appear before you today in the capacities of a private citizen and a doctor, but I

do not claim to be an expert. I am not speaking for the Canadian Medical Association, as I relinquished the position of chairman of its Committee on Traffic Accidents a year ago. However, I have cleared my presence here today with the Canadian Medical Association and they said: "Go ahead; it will be quite satisfactory to us if you appear."

I have been interested in the problem of highway safety since around 1950, and since that date I have served for varying terms as Secretary of the Ontario Medical Association's Committee on Highway Safety, Chairman of the Medical Advisory Committee of the Canadian Highway Safety Council and Chairman of the Canadian Medical Association's Committee on the Medical Aspects of Traffic Accidents. I am also a charter member of the recently-formed Traffic Injury Research Foundation on the staff of which is Air Vice Marshal Kerr.

It is on the basis of this broad experience that I appear before you today. While I am not an expert, the committees on which I have served know who are qualified experts on the medical aspects of this problem, and these have been consulted freely.

Those who have worked so long and so hard in this important public health field will be highly gratified that Bill No. C-87 is now being studied.

In 1955, the Canadian Medical Association became deeply concerned in this serious public health problem and appointed a standing committee on the medical aspects of traffic accidents. This committee's terms of reference were to do what it could to prevent traffic accidents, as the medical profession has a responsibility for prevention as well as treatment.

After studying the report of your meeting of April 26, it seemed to me that I might deal with three broad questions this morning. They are as follows:

1. Are there reliable, practical and reasonably accurate bio-chemical tests for the determination of alcohol in the blood.
2. If there are such tests, should they be made mandatory.
3. What arbitrary blood-alcohol levels should be set.

At this point, however, I feel that the size and the growing seriousness of the traffic accident problem in Canada should be more clearly placed on your records, and I would like to add just a few facts to those already given at your last meeting by Mr. Mather:

1. In Canada, accidents from all causes are the third leading cause of death, heart diseases being first and cancer second.
2. Accidents are the leading cause of loss of life years, or premature mortality. It is the leading cause of loss of life years with a percentage of 18.4. Heart diseases come second in this category, 14.7 per cent; and cancer third with 12 per cent.
3. Each year shows an increase over the previous year in traffic deaths, injuries and total traffic accidents in Canada.
4. In 1964, the traffic death rate per 100,000 population in Canada reached an all-time high of 25.3. This unhappy trend is also shown if you use other yardsticks such as deaths per 100,000 registered cars and deaths per hundred million vehicle miles.

So much for our purely Canadian experience, but there is one more figure I must place before you, and that is Canada's standing in relation to other

countries. In a list of twenty-five countries reporting traffic deaths per 100,000 population—reporting to the World Health Organization—and I omit South Africa because it deals with only a part of its population—Canada now occupies the last position—the bottom position—and I call this a national disgrace. I have made this statement when Canada was fourth from the bottom, third from the bottom, second from the bottom and I now say it when Canada has hit the bottom. I have made this statement at press conferences and I have never yet seen it emphasized or reported in the press. I wonder how many of you gentlemen know that fact?

Well, then, let us compare Canada's death rate of 25.3 with such countries as Norway with a rate of 9.5; England and Wales, 15.3; Sweden, 15.17; New Zealand, 16.6 and the United States, 24.8. There is only one way for Canada to go, and this leads up. We cannot go down. I am grateful to Dr. Stan Acres and Mr. Page of the Dominion Bureau of Statistics for helping me with these statistical facts, and I feel they are important. I have stayed with this problem because I keep asking myself: "Why is Canada so bad in this regard?"

Returning now to question No. 1, regarding bio-chemical tests, I would respectfully and strongly urge you to obtain the opinions of recognized and experienced experts in this limited technical and scientific field. This is what the Canadian Medical Association Committee did. This is too serious a problem to be solved by propagandists. Fortunately we have in Canada some highly qualified experts who have earned world-wide recognition. One of these is Dr. Ward Smith of Toronto, and I am delighted to learn from your Chairman that he will be appearing before you later. He was the vice president of the International Conference on Alcohol and Road Traffic in London, which I attended with him in 1962.

Mr. AIKEN: Dr. Troup, am I right in understanding that Dr. Ward Smith is a chemist, not a medical doctor?

Dr. TROUP: Yes, he is a Ph.D. I am perfectly right in calling him a doctor. I did not say he was a medical doctor. I was referring to the fact of this limited technical and scientific field.

Mr. AIKEN: Yes.

Dr. TROUP: After several years of study and investigation, the Canadian Medical Association adopted in 1961 the following recommendation:

The Committee recognizes further that the breathalyzer test, carried out by properly trained technicians, is an accurate method of determining blood alcohol levels, and recommends that the Canadian Medical Association also bring this procedure to the attention of the federal and provincial governments, and recommends that this test be used as a practical means of measuring blood alcohol in drivers of motor vehicles.

The Canadian Medical Association is, of course, well aware that there are other methods of determining alcohol levels using blood, urine, saliva, cerebrospinal fluid, et cetera. From my own studies, I find that there is no absolutely accurate test, no matter what bodily substance is used. This applies to blood as well as to breath, and in several respects the breath method has important technical and scientific advantages over all the other tests.

I might elaborate on that after I have finished my statement.

I understand that there are forty teams of trained technicians—provincial police—carrying out over ten thousand breathalyzer tests annually in Ontario, and the breathalyzer is used by the Royal Canadian Mounted Police in its provincial traffic police work.

In answer to question No. 1, I unhesitatingly endorse the use of the breathalyzer as a practical and reasonably accurate instrument for the determination of blood alcohol levels, when the test is carried out by properly trained technicians. I have a few reasons for my opinion:

- (a) With the breathalyzer, there is no question of assault.
- (b) There is no chance of infection by penetrating the skin.
- (c) The test can be performed by trained technicians without the help of a medical doctor.
- (d) Breathalyzer results are available immediately, and the test can be easily repeated and the results compared and still further tests carried out right at the time the policeman is making his investigation.
- (e) In making the test the breath passes directly from the suspect into the instrument, reducing the chance of contamination by other substances getting into it in the process of transportation.
- (f) The identification of the sample is simplified. The suspect is there and the instrument is there.
- (g) Breath samples may be collected in a plastic bag in sparsely inhabited areas. The Ottawa Police Department has very kindly sent me a sample if you would like to see it. I have it with me.
- (h) The standard deviations, found in all bio-chemical tests, can be offset by setting higher legal blood level limits.
- (i) The breathalyzer tests are recommended by the Canadian Medical Association, the British Medical Association, the American Medical Association, the World Health Organizations' Expert Committee on Alcohol—this away back in 1954, and it was not so enthusiastic then, but it recognized the test—and I was delighted to see in Monday morning's paper, I think it was, that the Quebec section of the Canadian Bar Association favours the breathalyzer test and that it be mandatory.
- (j) Then, there is one other point that I have added here at the end. Breath tests are already incorporated in our Criminal Code and I think they have been there since 1951. It is section 224(3): "In any proceedings under section 222 or 223, the result of a chemical analysis of a sample of the blood, urine, breath or other bodily substance of a person may be admitted in evidence on the issue." That was further confirmed in a letter which I received from the Department of Justice in connection with a brief I sent to Mr. Pearson about this whole problem.

I will now proceed to the second question, whether tests should be mandatory. As a citizen and as a doctor I feel I have perhaps worked long enough in this area to form an opinion. I am strongly in favour of the test being made mandatory, for the following reasons:

- (a) Each citizen should be treated alike in the investigation of traffic accidents.
- (b) The increasing percentage of refusals to take the test should call either for its abolition or a law to make it mandatory.

Dr. Peet—and may I add that he is the Dr. Peet who is now chairman of the C.M.A. committee in British Columbia—has said that in British Columbia the refusals to take this test when requested by the police had risen to 40 per cent; and Dr. Ward Smith has stated in London, England, that the refusals had risen in Ontario to 20 per cent in 1962; and the R.C.M.P. made an investigation right here in Ottawa and found the refusals increasing.

- (c) The taking of a test should not be dependent upon the salesmanship of the police officer or the sales resistance of the driver. That is what is happening in Ontario today.
- (d) The Canadian Medical Association Committee was impressed by the opinions of Professor A. R. L. Goodhart, an outstanding medico-legal expert and professor of medical jurisprudence at Oxford University, since retired. He has devoted much of his time to this particular problem, and I have with me a most interesting article that made a great impression on this medical committee. We have other authorities which we have read and we felt that we were on the right track in presenting our views.

Another reason is that I have with me the record of requests by provincial government ministers urging that the Criminal Code be changed to make breath tests mandatory. I have them here, too. I sent them to Mr. Pearson. They are quite clear-cut. They are from British Columbia, Alberta, Saskatchewan and some other provinces. I am impressed by the urgency with which these cabinet ministers, who are responsible for carrying out highway safety in their respective provinces, wish to see the law strengthened.

The third question about arbitrary blood levels should not be difficult to determine.

The level of .08 per cent has been suggested by the Canadian Medical Association, and when the Canadian Medical Association committee met with a committee of the Canadian Bar Association in Ottawa in March last year, the Canadian Bar Association view at that time was that they approved of a level of .08 per cent. The British Medical Association has recommended to the British government that an arbitrary blood alcohol level of .08 per cent be set, and the British government in its White Paper, of which I hope you all have a copy, also quotes the figure of .08 per cent.

This new law, however, would have some effect upon a deeply ingrained social habit or a combination of habits—that of drinking, that of driving and that of driving after drinking, which are deeply ingrained social habits; and, to make it more readily accepted by the public, perhaps a slightly higher level might be set at first, say, .10. This is the level adopted by New York State with a level of half that—.05—for suspects under 21 years of age.

In any case, if you have answered the first two questions the level could easily be settled and easily changed in the light of experience in this country and in other countries.

Next year is Canada's Centennial Year. What better way to celebrate the occasion than by enacting legislation that will make Canada's streets and highways safer for our citizens and our visitors?

The CHAIRMAN: Thank you, very, very much indeed, Dr. Troup. The attention that members have given to you is indicative of their extreme interest and the fact that they were absorbing to a 100 per cent degree, what you were saying.

Dr. Troup has, of course, agreed to answer questions, but before proceeding to that you will recall that he mentioned Dr. Ward Smith and Mr. Piper, who are going to be witnesses before this Committee. The Clerk has informed me that they will be here on June 7. The meeting of the Committee on June 7 is at 9.30, which means we will terminate at 11 o'clock. We may not be through with these two distinguished gentlemen by 11 o'clock and it might be in order to ask now for leave of the House to meet in the afternoon of that day, or, when we have out-of-town witnesses, while the House is in session.

If that meets with your approval I will be glad to have a motion.

Mr. FOREST: I so move.

Mr. HONEY: I second the motion.

The CHAIRMAN: It is moved by Mr. Forest and seconded by Mr. Honey that we request leave of the House to sit while it is in session for the purpose of hearing witnesses who are available but who will be here when the House is in session.

Any discussion?

Motion agreed to.

Now, Dr. Troup, if you will be good enough, I know that the members have a lot of questions that they would like to ask you.

Mr. AIKEN: The first question I would like to ask Dr. Troup is related to the comparative position of Canada and the United States. You showed Canada as last in relation to traffic deaths per mile, and so forth.

Dr. TROUP: Per 100,000 population.

Mr. AIKEN: Population; and I understood that this was also taken on the basis of million miles of travel.

Dr. TROUP: No. I stated that in dealing with Canada alone. The first few facts are related to Canada alone. Could I read it?

In 1964 the traffic death rate per 100,000 population in Canada reached an all-time high of 25.3. This unhappy trend is also shown if you use other yardsticks such as deaths per 100,000 registered cars and deaths per 100 million vehicle miles.

Now, I have the figures with me supporting this.

Mr. AIKEN: I was trying to find out whether you have any theories as to why Canada is worse than the United States in this scale, because of the fact that the vehicles in general are the same and the road conditions in general are the same. We are not very much below them, but there is a difference. Have you any idea why this is so?

Dr. TROUP: I wish I could say this authoritatively, but there is the difference that in a number of states they have much more realistic legislation regarding the drunken driver than we have in Canada. I think in six of the states biochemical tests are mandatory, and I think in another 12 or so they are permissive; that is, when you sign your application for a licence to drive you indicate you will submit to any biochemical tests that you are required to undergo.

I have not studied very much what is happening in the United States, because there is so much to study in Canada.

Mr. AIKEN: I have another question on a slightly different line, and it is on this question of mandatory tests.

The first thing that bothers members of the legal profession—and most of us here—is that there is a basic rule against self-incrimination. This is presumably the reason why the code makes it voluntary. Do you feel now that the situation is that the national interest overrides this basic rule, and that it is more important in this situation to determine the alcohol content and obtain convictions than the original protection that the law gave?

Dr. TROUP: Yes, I certainly do; and I look at Saskatchewan's efforts to overcome this defect in the law. They brought in a regulation—I am amongst lawyers, and I am completely out of my element, but you can correct me if I am wrong—Saskatchewan had the same limitations as the other provinces have with regard to the Criminal Code and biochemical tests, but they passed a regulation, which is administered by the traffic board, that if the R.C.M.P., who do the police work there, are asked to investigate an accident and they think the driver has been drinking they may ask the driver to undergo a biochemical test. It is a breathalyzer test, and if he refuses to have it, the police have authority to suspend his driving licence for a period of three or four months. It does not go to court and it is very much better just to hand over your licence for a few months and then get it back again from the police.

The proof of the pudding is the eating. Saskatchewan's death rate is not much lower than that of Alberta. I am speaking from memory. It is a little bit lower but the attorney general in Saskatchewan is one of the strongest spokesmen for mandatory breath tests. In the Saskatoon *Star-Phoenix* of September 12, 1964 the Honourable D. V. Heald, attorney general, says—and this is the headline: "Urges compulsory breath test and impaired driving standard."

He told the delegates at the annual convention of the Canadian Association of Chiefs of Police that he would recommend that a new summary conviction offence be created under the Criminal Code of Canada, prohibiting operation of a motor vehicle by a driver with a blood alcohol content of more than .06 per cent, and that the breathalyzer test be compulsory, provided that refusal by a subject to take one should not give rise to a penalty until the suspect appears before the highway traffic board. I have given you the gist of what he said.

Saskatchewan is strongly in favour of mandatory breath tests on a lower level even of that which other authorities have suggested.

Mr. AIKEN: Just one more question on that line, Dr. Troup. Can you clear up for me the relationship between breath test percentages and blood percentages? I am well acquainted with the blood percentages because that is what we have been using and when you mention .08 per cent, I think that most people who are up on impaired charges would be guilty if they kept it to that amount.

What are the figures on breath tests? What is the chemical content and how is it calculated?

Dr. TROUP: Now, you are going to hear Dr. Ward Smith, and at the outset I impressed upon you that I am not an expert in this field. It is a highly technical and scientific field; but as a doctor and having worked in this area, I have given it a great deal of study and heard a great many discussions, scientific and otherwise. But you are asking for an answer to a very technical question. It would be presumptuous of me to answer that in any scientific detail.

I would say, however, after reading the proceedings of your first meeting, that I got the feeling that you are under the impression that the blood test was the only accurate test; that it was the best test and that there was no deviation from it. Now, unfortunately, that is not so. I went out and spent a day at the biochemical department at the Civic Hospital, just last week before coming here, and I confirmed again that all biochemical tests have a plus or minus value—the high and the low.

In fact, in the doctors' cloak room at the Civic Hospital you will always find a chart, which is composed of two pages and a bit more. This is the quality control chart of all the biochemical tests that are done in the pathology department at the Civic Hospital. It gives an upper limit and a lower limit and then the mean; and for tests that are being performed every day the control is put up every day for the guidance of the doctors. If I were to hand you this you would read of a great many tests by blood, sugar, uric acid, and all these things, and you would find alcohol missing. You could ask me, "Why is not alcohol here and what is this blood alcohol? Why is it not here? Well, it is a very interesting story and I am going to take time, Mr. Chairman, to tell you.

The British Medical Association has developed what it considers to be a very refined method of examining alcohol in the blood, called the G.L.C.—gas liquid chromatography. I am not going to get out of my depth because I am reading from the *London Illustrated News* and it is not too scientific for me. This is a new instrument that determines the amount of alcohol in the blood.

They happen to have one of these instruments at the Civic Hospital. There are a few in Canada; it is an expensive instrument and it is one of the latest. It is not used very much at the Civic Hospital because the pathologists there, who, at the request of coroners are performing post mortems on drivers who have been killed in traffic accidents, send their blood samples to Dr. Ward Smith's laboratory in Toronto so that they will all be done in the same laboratory, with the same instruments, to try to eliminate certain abnormalities that might creep in. However, there are at the Civic Hospital patients whose blood alcohol might have to be determined, and that is why the instrument is there. I asked Dr. Poznanski, who is in charge of biochemistry at the hospital, "If you put this chart up for blood alcohol what would be the plus and minus value? He called up his technician and he asked what it was the last time he did the test and the answer was plus or minus 7 per cent in 100 milligrams. This shows that the blood test is not the exact one to which you seem to be pinning your faith here, and rejecting the breathalyzer test because it was not as good as the blood test.

Then, I am reading this from Britain—and this is "Drink and Driving—the Evidence in a Drop of Blood." "The beauty of this system, sometimes called gas liquid chromatography, or G.L.C. for short, is that it is fast, accurate and practically immune from human error." I used the words "reasonably accurate"

repeatedly this morning in referring to the breathalyzer test. Then, referring to this instrument it says that "... all this has proved that the Nottingham G.L.C."—that is, this instrument and after having great experience with it—"this G.L.C. method can measure 80 milligrams of alcohol in 100 millimeters of blood to an average accuracy..." Have I made my point? I hope I have.

If you are looking for a perfect test, beyond all reasonable doubt, you are not going to get it today, because it does not exist.

I think probably you will bring in the breath and the blood. What we want to get at is the amount of alcohol going to the suspect's brain. As it goes to the brain, through arterial blood, it has its load of alcohol from the stomach. As it passes through the lungs there is a recognized physical exchange—diffusion—of alcohol from the blood into the breath; and it is extremely accurate.

The CHAIRMAN: Thank you, Dr. Troup. Next I have Mr. Goyer and then Mr. Otto.

(Translation)

Mr. GOYER: I must confess that the reasons you gave for making the test mandatory have not convinced me because I think that, medically speaking, scientifically speaking, we should have found that the test had a value up to a certain point that would be absolute, but up to what point? You mentioned there was no test that really had an absolute value. Could you tell us what is the proportion of error in the breathalyzer test?

(English)

Dr. TROUP: Yes; it is .001 according to Dr. Ward Smith who will be appearing here before you and will speak from his practical work in hundreds of examinations comparing the breath and the blood at the same time.

(Translation)

Mr. GOYER: You mentioned, for instance, that in the State of New York, the age also had to be taken into account in establishing that such and such a percentage of alcohol actually affected people. Is that right?

(English)

The CHAIRMAN: Just a moment, Mr. Goyer. Dr. Troup, you are not hearing it either, are you?

Dr. TROUP: As I understand it—and I am not an authority on New York state law, or any law—my latest information is that there is permissive law in New York, that is, you give permission to the government to carry out biochemical tests, and the legal upper limit of blood alcohol is .10. However, if the suspect is under 21 years of age the level is lowered to .05. To me, this is no doubt as a result of New York state's experience with drivers and their ages—

(Translation)

Mr. GOYER: Now would you agree in saying that the physiological state of an individual can influence, can vary the percentage by a certain decimal point?

(English)

Dr. TROUP: I am very glad you have asked that question. All that the breathalyzer test shows is the amount of alcohol in the blood passing through that man's lungs at that time. It does not show how much alcohol he has

consumed, what kind of alcohol he has consumed, when he consumed it, whether it was mixed with food, whether he was tired, or any other physiological condition; it is just one simple fact that speaks for itself. Not the man himself speaking, but the scientific instrument, in which we have confidence, gives you that one reading showing how much alcohol was present in this man's blood at the time the test was made.

(Translation)

Mr. GOYER: Which means that if the test shows how much alcohol the person has imbibed, then his physiological condition can of necessity come into account. For instance, if a person was in a depression or some extreme emotional condition, as compared to someone who was in perfect physiological condition before consuming alcohol, then it could affect the results?

(English)

Dr. TROUP: It could affect what results?

(Translation)

Mr. GOYER: The results of the test.

(English)

Dr. TROUP: No, we are not saying whether he is intoxicated or not. We are not saying whether he is able to drive or not. The test does not tell you that.

(Translation)

Mr. GOYER: The test is going to show that above .08 per cent, the individual was not in a state fit to drive. If the law says that above .08 per cent the individual is guilty of having driven in an impaired state, that amounts to saying that at .08 per cent the person was not in a condition to drive a car.

(English)

Dr. TROUP: Well, experience has shown that after a person has taken a certain amount of alcohol his driving ability becomes impaired.

I have here the report on impaired driving tests, carried out at Rockcliffe by the R.C.M.P. in 1955, to which I would refer you for the answer. Numerous tests have been done to show that the first effect of alcohol on the brain of a human being is to disturb his judgment. The disturbed judgment affects his driving.

There is another very important study and that is the effect of small doses of alcohol on a skill resembling driving put out by the Medical Research Council of the Privy Council in 1959 and if you read these you would get very complete answers to your questions with regard to the increasing risks and the chances of accidents after imbibing. But it does not apply to one individual.

We have on the highway speed limits which apply to all drivers. You surely could not get away with the offence of driving at 80 miles an hour on a public highway when the speed limit was 50 miles an hour on the ground that you were an experienced professional driver and were much more competent than the average driver. That would lead to chaos.

(Translation)

Mr. GOYER: I quite agree that is the consequence that we will have to draw, but what I want to establish clearly here is that it is quite certain, if one

imbibes alcohol, it can affect the driving faculties of a person. But what we have to find out is to what extent. What I am trying to find out is that if a person who is in good physical condition as compared to someone who is, perhaps in a passing manner, or normally is very nervous, whether or not that is going to affect that person. The result of the test will be able to tell us if a person who was in such and such a condition before, after having consumed so much alcohol, is worse off than a person who was perfectly fit and who has consumed the same amount of alcohol. It would not be the same manner of driving in the case of these two people. If I can go a bit further—for instance, someone who is quite used to imbibing alcohol, if we compare him with a person who is not used to drinking, would you recognize that of necessity there is a deformation in the interpretation of the test?

(English)

Dr. TROUP: That is a very good question and it is beautifully taken care of in this Royal Canadian Mounted Police research. They took three groups of human guinea pigs—the light drinkers, the moderate drinkers and the heavy drinkers. I am speaking from memory now because it is some time since I really studied this volume, but the point was this: That in the early stages of the experiment when they gave just one or two drinks it seemed to have less effect on the heavy drinkers; but, when you got up to around .08 the percentage of errors by the heavy drinkers was just as high as those of the moderate drinkers and the light drinkers. Does that answer your question?

You speak about nervous conditions. We drive whether we are nervous or not. We drive whether we are tired or not. All these other factors have a part to play in it but this is the scientific determination of the amount of alcohol in the driver's blood at the time; and we do know, and must accept, that the more alcohol you have in your blood the more risk there is of your becoming involved in an accident.

(Translation)

Mr. GOYER: I am thinking in a personal manner, if you like. One day, you are going to drink just one glass and its effects may be bigger on you than on a day you consume three glasses. So, of necessity, the physiological condition would affect somebody's behaviour, in my opinion. But if you think the contrary has been proved by facts, well, then, that gives rise to questions between science—and I would have to revise my opinion.

(English)

Dr. TROUP: Well, on the question of physical fitness, alcohol only presents one scientific fact; but a traffic accident is investigated by a police officer, and you have other evidence of a person's behaviour. If he had been extremely tired or exhausted, if he had a medical disability, if he was under a certain drug treatment, if he was a diabetic—surely all these things would be brought out at the trial.

What this bill is initially aiming at is the establishment in every case—I forget the phrase—but where it would be justified to take this test, let it be taken, and have that one additional fact in the evidence for the administration of justice.

(Translation)

Mr. GOYER: That is the manner in which it is presented, I regret, because it seems to be that what is required is that the test be made compulsory, which is already debatable. And second, it is said that after a certain percentage, a person would be presumed guilty. That is going much further than what we have at the present time. That is exactly why I attach a great deal of importance to the percentage of errors due partially to the test itself, due to age, due to the physiological condition, to the habit of taking alcohol and the constitution of a given person. What worries me is the margin of an error that can be accumulated in the case of an individual who would be meeting all these conditions—a person who is young, a person who is not used to imbibing alcohol, a person who is in a depressed state, and then the test may have made an error. I do not know. In that case we may have a high percentage of errors, which might give results which would be unjust.

(English)

Mr. MATHER: Mr. Chairman, I have a related question. I wonder if the doctor could say what the percentage of fatalities is in the case of people who have imbibed alcohol? That is, roughly what percentage of fatal accidents are those which involve people who have been imbibing?

Dr. TROUP: In Canada there has been no complete study to enable us to answer that question directly, because investigators may not do a breath test on the highways arbitrarily; investigating people are not allowed to. But the coroners in Ontario and around Ottawa order the pathologists at the Civic Hospital to send the blood of all drivers, on whom a post mortem has been done, to Dr. Ward Smith of the attorney general's laboratory in Toronto.

Just last week I asked the doctor who handles this particular activity: "Without quoting any figures, what is your experience with the blood samples you send up from this district? What percentage of them have a significant amount of alcohol in the blood?" He said, "At least 50 per cent."

Mr. MATHER: Fifty per cent?

Dr. TROUP: Yes. That is not a scientific answer, Mr. Mather. Some studies have been done in other countries, but in Canada I have not got them.

I would point out that we have accumulated a tremendous amount of medical information. I hold in my hand here a statement prepared by the Traffic Injury Research Foundation, medical bibliography from 1955 to 1964. These are papers on the medical aspects of traffic accidents. A tremendous amount of work has been done.

The CHAIRMAN: Mr. Otto, you are next.

Mr. OTTO: Dr. Troup, you mentioned Canada's unenviable record in connection with traffic deaths. Are you suggesting that our record so far as drinking or drunken driving or accidents due to the use of alcohol is the highest in the world, or is that just traffic fatalities of all kinds?

Dr. TROUP: Oh, I did not break it down. But, as you study this question, this desperately bad situation in Canada, you ask yourself the question, "Why is it so much lower than it is in Sweden and Norway?" You go and study the driving and alcohol laws in those countries and you find, as you would see from the proceedings of your last meeting, that the biochemical tests were introduced in Norway in 1926. Of course they were blood tests because there were no

breathalizers at that time. You are forced to conclude that Canadians are just as good drivers as the Norwegians, Swedes or the Belgians. There must be some factor, and these countries with the most realistic legislation against drunken driving are enjoying the lowest mortality rates.

Now, although we are dealing with alcohol and driving this morning, I am under no illusion that the passing of this bill would wipe out traffic accidents in Canada. I would be happy in the first place to see the increase stopped. I would like to see us hit a plateau in the first year or two. Then, as we are more prepared administratively from the point of view of law enforcement, that our death rate might come down from 25 to 20. We might even come down to England's rate of 15 point something. Look at the enormous number of lives that would be saved. If we brought it down 10 per cent this year we would be saving 500 lives because you can almost bet there will be 5,000 killed in Canada this year. There were almost 5,000 last year.

Mr. OTTO: But nevertheless, Dr. Troup, it is still a presumption on your part that our heavy traffic fatalities are due to alcohol. It is only a presumption and not based on any records that we have.

Dr. TROUP: Oh, I am glad you brought that up. That brings me to another point, if I can find it.

When I was active in this field I used to receive a report from the Ontario Department of Highways. It was a monthly report of its fatal motor vehicle traffic accidents on the King's highway only. This is the last issue I received. I am sorry it goes back to March, 1964, but I made some comments about this at a press conference in June, 1964 and I seem to have been struck off the mailing list because they did not like my remarks. Of course, I am assuming this.

This is a most interesting document by the police, and it outlines all the fatal accidents on the King's highway during that month. It tells you the highway, the location, the character of the road, type of surface, surface conditions, light conditions and time, type of accident and persons killed and injured. Then there is the description of the accident by the Ontario Provincial Police. I quote: "driver drinking; driver drinking, lost control; pedestrian had been drinking, inattentive drunk; driver drinking, pedestrian 82; driver had been drinking; both drivers drinking; pedestrian drinking, speed, a boy aged four ran into a southbound small car but the driver had been drinking; driver drinking". Now, let me hasten to the conclusion and it says here, "Note: Drinking drivers and pedestrians involved in 22 fatal accidents or 53.7 per cent of the total fatal accidents in Ontario on the King's highway in the month of March."

Mr. OTTO: Well, Dr. Troup, as devil's advocate, so to speak, I would say that at least 50 per cent of the figures you quote were innocent drunkards who were not responsible for the accident. In other words, you always have two people involved and you never know who is responsible for the accident, and sometimes the innocent person as well as the one who suffers a fatality is also under the influence of alcohol. I do not suggest for a moment, Dr. Troup, that alcohol is not a great contributing factor; in fact, it is probably the most contributing factor.

Then in reply to a question previously put you said that you were under the impression that an arbitrary limit would have to be set. Now, I take it from our evidence that you would be in favour of setting an arbitrary alcohol

content in connection with traffic accidents. You pointed out there is a speed limit and that everyone is subject to this limit. I just wanted to question you on this because it will have a very serious effect on the question of law. Although, as you say, there is a speed limit and a person may be fined for speeding; but if he happens to get into an accident it still has to be proven that his speeding or that person was the cause of the damage or the injury. Now then, I am going to put it to you, as a witness to an accident or as a witness in court giving evidence as a medical doctor, regardless of the size of the individual, the health of the individual, the physical feeling and so on, would you not be inclined in time to arbitrarily say that a person was drunk if that alcohol content was found in his blood or on his breath? In other words, I am trying to find out the consequences of setting an arbitrary limit on the administration of justice. Would it be acknowledged in time that a certain arbitrary limit automatically would find that person guilty regardless of all the other arguments that could be presented by his counsel?

Dr. TROUP: Yes. The situation is becoming so bad; the slaughter is so great and increasing every year that you are faced on the one hand with the big broad public interest of safety for all users of the highway, and it is going to get worse if you do not make realistic legislation to combat it—and do it now; it is late. We are behind so many other countries in doing it. We know that those countries which have enacted this type of legislation against drinking and driving have not repealed it in one single instance, and as years go on they amend the legislation making it more and more severe. Just to give one example, in Norway they discovered that the lawyers were getting their clients off by saying, “Oh yes he had a high blood alcohol content, but one of the people at the scene of the accident gave him a swig of liquor after the accident to settle his nerves because he was upset”. But, it is now an offence in Norway to consume any alcoholic beverages after you have been involved in a traffic accident for the next six hours or until the police have completed its investigation of you.

Mr. OTTO: Of course, the Committee will have to consider at a later time these differences of opinion with regard to the law, freedom and so on between some of the other countries and Canada. However, I want to go further. In connection with the breathalyzer—and, you may not want to answer this—is it possible for a technician who operates the breathalyzer machine to tamper with it and to set it higher or lower in the event he so chooses?

Dr. TROUP: I have gone down to the research laboratory at Hockcliffe and I have seen many of these tests. What you are saying is that we could not always trust the police who were carrying out the tests.

Mr. OTTO: I am not saying you could not always trust them.

Dr. TROUP: But you said tampering.

Mr. OTTO: But, would it be possible on one occasion? Let us suppose that I am the police officer and I am taking the test. All of a sudden before me appears my most hated enemy; would it be possible for me to set that up or down?

Dr. TROUP: Of course it could be if you wanted to do it deliberately. But you are painting a picture that surely is not the case.

Now, I will give you the breathalyzer check. There are nine things the police technician puts down and the time that he does them. First, he takes a

check on the accuracy of his instruments; he does this by testing the air in the room in which the test is being carried out. Then he checks it with a known quantity of alcohol and if the breathalyzer in the first test says there is no alcohol in the room he records the exact percentage he knew he put through the instrument and then he knows that the chemical reagent that he put in in the form of a cartridge is up to standard. He then proceeds and carries out the breath test; having done that and secured a reading he waits another 15 minutes and he does the test over again. The advantage of the breath test is that he immediately knows the result. If it is very high, very low or abnormal he knows that a second check would be very valuable so he does it again a second time. He therefore has two readings. If by any chance they are not comparable, he can do a third test because he has the breathalyzer and the subject right there with him. That is how the test is carried out. And, he comes into court I believe—you lawyers would know—with all this information carefully completed in support of his test. I am surprised to think that there would be any tampering. I think these men are very proud of their reputations for accuracy.

Mr. OTTO: Sometimes, Dr. Troup, in your position you have a different opinion than we lawyers have. Mind you, it is not that the police department may be dishonest but sometimes the police forces or, let us say, the administrators of the police department have their own opinion of how law should be administered, and it is sometimes we solicitors or lawyers who have to constantly maintain a semblance of freedom. I have suspected at times, in my years of practice, that there was a little too much vigour on the part of police administrators in a sphere or in an atmosphere in which they think they are right; this sometimes happens with parking and speeding and so on. I think we have all been through that.

There is just one more question I would like to put. We have been concentrating on the consumption of alcohol and, as you say, our departments have made a great number of research tests and have been involved with projects in this field. Has any attempt ever been made to do any extensive research on hangovers; in other words, accidents as a result of the day after drinking or a few hours after drinking. I was reading a report quite recently in which the hangover was shown to produce the same results or even worse results than drinking, in other words, bad judgment, a feeling of depression and all these things. Have we ever done any research in that field?

Dr. TROUP: I am glad you raised that. It was discussed at the International Conference on Alcohol and Road Traffic in London in 1962, which I attended. There was a very interesting paper there. We have a traffic injury research foundation in this country, and I am sure, if you requested this foundation to carry out this type of test, it would be perhaps worth while and interesting. This foundation is sponsored by the Royal College of Physicians and Surgeons, supported by the Canadian Medical Association and a number of other bodies who are genuinely interested in reducing traffic accidents.

Mr. OTTO: Thank you.

The CHAIRMAN: I have Mr. Mather, Mr. McQuaid and Mr. Forest who want to ask questions. I understand Mr. Choquette has a related or supplementary question. It is now 11.00 o'clock but I am sure the doctor will be willing to carry on.

Dr. TROUP: I am quite willing.

The CHAIRMAN: Mr. Choquette, will you proceed.

(Translation)

Mr. CHOQUETTE: I would like to refer to the question that was previously asked by Mr. Otto; that is to say, whether the police would not be in a position to tamper with the test. Is there any possibility of returning samples? They can be handed over or retained so as to avoid any possibility of fraud.

(English)

Dr. TROUP: Yes, there are all sorts of precautions for the accused in this. He gets the result of the test and, if he wishes, can ask for a bag, breathe in his own breath at the time and have it examined independent of the police officer.

Mr. MATHER: Mr. Chairman, as the sponsor of this bill I am very pleased with the very thorough airing and consideration that is being given to it through Dr. Troup's testimony. I just have one or two brief questions. I will not deal with the area in respect of the validity of the tests.

In sponsoring the bill I did some studying and I am personally convinced that the breathalyzer test offers a very good standard by which to judge these things. But, with regard to the points about civil liberties being involved here, Dr. Troup, would you agree that the lack of a mandatory test creates a situation which tends to protect the guilty while offering no shield at all to the innocent.

Dr. TROUP: I certainly do. These accidents are sufficiently frequent. They have affected every one of our families and we all must have had personal experiences about that. The innocent are certainly not protected in our present day laws.

Mr. MATHER: Having in mind the fact that under present day laws the person who is involved in an automobile accident is compelled to remain at the scene of the accident to produce papers for the ownership of his vehicle, his right to drive that vehicle and also sometimes to submit the vehicle to a mandatory test at the scene of the accident. Would you not agree with me that the addition of this one further step, the mandatory breathalyzer testing of the physical condition of that driver, is simply part of what is becoming a traffic safety shield?

Dr. TROUP: Yes. We are into an area on which I do not like to speak before this Committee with too much assurance, but here is a quotation from Dean I. C. Rand, retired Justice of the Supreme Court of Canada, and one of Canada's foremost legal minds. It says here he favours the use of the breathalyzer. He said:

It has actually been proven and it is a major weapon in the war on highway deaths and injuries. The breathalyzer is very relevant evidence. Its evidence is simply a fact. It must be made compulsory. If you do not make it compulsory, drivers will feel that they have a right to drive while under the influence. I do not see how you will deal with the slaughter on the highways unless you have something like this.

This ties in too with the percentage I gave you of refusals to take the test and the refusals are usually by those who have had a brush with the law before. They are wise to the fact that they do not have to undergo the test. Dr. Smith of

the Ontario Attorney General's department estimated that 28 per cent of drivers involved in fatal accidents had alcohol problems. And you know that an alcoholic is conditioned to defend himself, to wriggle out and make excuses. So, he knows the law is on his side and he says, "I will not submit to a biochemical test."

Mr. MATHER: Mr. Chairman, those are all the questions I have.

Mr. OTTO: Mr. Chairman, just on that one point so the record will be straight. Mr. Mather has pointed out, and so has Dr. Troup, that you have to stop, you have to produce your licence and you have to produce your insurance. All these are facts which will not incriminate you. In other words, they will not find you guilty. But I suggest that as Dr. Troup pointed out earlier, the fact of having a certain percentage of alcohol would automatically find you guilty because the witnesses, like Dr. Troup, will have an arbitrary figure in their heads as to the amount of alcohol and this particular fact will find the driver guilty whether in fact he is guilty or not. That is the difference you had not pointed out, Mr. Mather.

Mr. MATHER: If I could just say a word to that. I think if one is involved in an automobile accident and is asked to produce his driver's licence and he fails to do so, or if his car is examined—and he must submit to that examination of his car—and the car is found to be faulty, I think these elements would also play a part in determining judgment.

Mr. OTTO: They do not, not as a rule.

The CHAIRMAN: Mr. McQuaid.

Mr. McQUAID: Mr. Chairman, my question may have been answered by Dr. Troup in reply to a question by Mr. Otto but I just want to clarify this. This afternoon, we will say, I am picked up and charged with impaired driving. There has not been any accident; there is a compulsory breathalyzer test and the rate set is .10 we will say, and the test shows that I have .10 alcohol in my blood. Are you suggesting that that is an irrebuttable presumption that I am impaired—that is, I cannot produce any evidence to show, even though the breathalyzer test may read .10, that the test was not properly taken or that my physical condition was such that I am still not impaired with .10 alcohol in my blood?

Dr. TROUP: You are dragging me into the legal field against my will. The test will just show the amount of alcohol in your blood. It will not show anything about how impaired you were as a driver. That is all the test will show. Are you not reading too much into the test?

Mr. McQUAID: It is not an irrebuttable presumption then. I presume that I could still be allowed to produce evidence to show that even although I may have that alcoholic content it does not necessarily prove that I was impaired at the time.

Dr. TROUP: It would depend on what the law is at the time. You are saying this afternoon. Well, in the first place you would not have to undergo the test if you did not want to. You said it was compulsory but it would not be this afternoon in Canada. You have been asked to take the test and you have taken it. That test just shows one fact. As Justice Rand says its evidence is simply a fact that at the time of the accident or immediately after the accident you had a certain amount of alcohol in your blood. That is as far as it goes.

Mr. McQUAID: I would be still free to introduce evidence that the test was not properly taken.

Dr. TROUP: If you could prove it, yes.

Mr. McQUAID: That is what I mean.

Dr. TROUP: But you would have Sergeant Burnett of the Ottawa Police department up against you.

Mr. FOREST: This is a related question and it is quite important. I believe the main objection to the breathalyzer test is that it does not take into account the individual's tolerance for alcohol. Some people might show a level higher than .08 and still would not be intoxicated to the point of impairment. In this bill we have stated that a level of .08 would be conclusive evidence that the ability of the said person to drive is impaired. Now do you think we should raise this level to .10, as you have mentioned, to take care of all these marginal cases. Is it safe at .08?

Dr. TROUP: These tests show that the extra hazard starts when the blood alcohol level reaches .04 or .05, or when the blood alcohol level is up to that. When a person goes on the highway with a blood alcohol level of .08 he is classifying himself and he is putting himself, deliberately or otherwise, into a group of drivers who are much more likely to have accidents than those who have gone on the highway without alcohol, or with very small amounts of alcohol.

Mr. LAFLAMME: That would apply to everybody.

Dr. TROUP: Everybody, yes; just as it applies to speeders breaking the law.

Mr. HONEY: Doctor, I just have one question and if you can answer it I think it might assist me in evaluating the evidence. I am just wondering if, from a personal standpoint, and as a result of your studies and research into this matter, you would feel it desirable, or a desirable goal for legislation in Canada, to provide that when the level of alcohol in the blood reaches a certain point—say, .08 or .10, or at least a point which was defined in the legislation—that would then mean a conviction for impaired driving or drunk driving, as the case may be? In other words, do you think it is desirable to have that as an overriding and exclusive factor.

Dr. TROUP: Yes; I do today. Mr. Pearson, you know, in 1964, urged every citizen "...to recognize and fully accept his own individual responsibility in correcting the causes of the death in the traffic toll, through the persistent co-operation of every Canadian..." I therefore wrote to Mr. Pearson and gave him a lot of facts. I finished the letter by saying, "In response to your letter I ask you, in your position of great responsibility and authority, to initiate amendments to the Canadian Criminal Code to enable provincial governments to require suspected drinking drivers involved in accidents to undergo biochemical tests the results of which would be used as corroboratory evidence in court".

Since I wrote that I have studied the British White Paper. They are terribly concerned about their traffic deaths and it is almost half of ours. They are proposing to bring in legislation which will make a certain blood alcohol level *prima facie* evidence. If this bill passes in Britain you have broken the law if you drive a car on a public road with a blood alcohol level of more than .08.

I was impressed with the studies the Canadian Bar Association gave this important matter and I mentioned earlier that the president and the secretary and Mr. Isbister spent a whole day with our C.M.A. committee, and they gave us a brief that they had submitted to the Minister of Justice.

I know that it has been stalled, just as many of our recommendations have been stalled in the medical association. But eventually, by further study, we made progress.

I was impressed by the fact that the Canadian Bar Association, in tackling this as a serious national problem, has gone as far as the British government went last December—or as far as the British Government's White Paper went. Therefore, if I were writing this brief I would stress as *prima facie* evidence, that with a certain amount of blood alcohol in the system you should not be driving.

Mr. HONEY: That is, when the blood alcohol reaches a certain point that is *prima facie* evidence that the driver is impaired?

Dr. TROUP: Yes. Now, the only suggestion I made that might not have agreed with Mr. Mather's bill—and it was just a suggestion—is that because of the deeply ingrained social habit and the opposition that you will get—which you will get from anywhere—it might be safer to have it a little higher than it should be; and then, in the light of experience, you can have the level amended and brought down as other countries have done. Sweden and Norway started with .15; they went down to .12, to .10, to .08, and now they are down to .05.

Mr. HONEY: Do you have enough faith in the accuracy of the breathalyzer test, doctor, to feel that it would be responsible to place a driver in the position where he could, in fact, be convicted by this evidence alone?

Dr. TROUP: Yes, I have.

Mr. HONEY: Mr. Chairman, may I ask just one more question?

Mr. McQUAID: Oh, I am sorry. Go ahead.

Mr. HONEY: This is in connection with your last statement. Do I understand your conclusion to be, then, that the result of this test should only be *prima facie* evidence?

Dr. TROUP: Yes; I am speaking as a private individual now.

Mr. HONEY: Yes, this of course does not go along with the text of the bill.

Dr. TROUP: It does not go along with all—

Mr. HONEY: Is it not conclusive?

Mr. MATHER: No, the bill provides for the mandatory testing.

Mr. HONEY: But does it not say that it shall be conclusive evidence?

Dr. TROUP: Yes—

Mr. HONEY: But your proposition is that it should not be conclusive evidence but that it should only be *prima facie* evidence—that is, evidence which is rebuttable?

The CHAIRMAN: I do not think that the witness has to answer that question. It is a legal question.

Mr. HONEY: No; but I am just wondering what his thinking is on it; it will help me arrive at a decision.

Dr. TROUP: I could make this statement, because I have been working in this area since 1955: My views have changed—they have never been fixed—and I am becoming more and more convinced that a drastic situation has developed, which will require drastic legislation. I have seen such statements made in *Hansard* which I have searched for a long time.

Mr. LAFLAMME: Doctor, to deal with the opposite side, I just would like to know this: Is it possible to drink less than three ounces of alcohol and have a result on breath analysis, higher than .08 per cent.

Dr. TROUP: Well, three ounces of Canadian whisky—I mean alcohol! This is very important, you see. So many factors enter into it. Is it British whisky or is it the Canadian watered whisky? You see there is a difference in proof. I could not answer that question categorically.

The big thing is that by adopting .08 you could still be driving on the highway with a blood alcohol less than that and be responsible for killing somebody because you were impaired. We cannot drink up to .08 and drive with impunity on the highway.

Mr. LAFLAMME: I agree with that.

Dr. TROUP: Now, you want to know whether three ounces—

Mr. LAFLAMME: Well, suppose a man has drunk three ounces of alcohol and they take his breath analysis. Is it possible that the result could be around .08 per cent?

Dr. TROUP: Oh, I do not think so. But would you ask Dr. Ward Smith that? I do not think so at all. That would be away too high.

The CHAIRMAN: Are there any more questions?

Then, I think, once again, Dr. Troup, the Committee would wish me to thank you for your attendance here this morning, for your very instructive discussion and for the very excellent way in which you have answered the questions which have been put to you. Thank you very much indeed, sir.

Dr. TROUP: It is a pleasure, Mr. Chairman.

OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 7

FRIDAY, MAY 27, 1966

Respecting the subject-matter of

- Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).
Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).
Bill C-87, An Act to amend the Criminal Code (Impaired Driving).
Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and
Private Members' Notices of Motions Numbers 26 and 31.

WITNESS:

The Hon. C. M. Drury, Minister of Defence Production.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Honey,	Mr. Ryan,
Mr. Asselin (<i>Charlevoix</i>),	Mr. Laflamme,	Mr. Scott (<i>Danforth</i>),
Mr. Bell (<i>Carleton</i>),	Mr. Latulippe,	¹ Mr. Stanbury,
Mr. Choquette,	Mr. MacEwan,	Mr. Trudeau,
Mr. Chrétien,	Mr. Mather,	Mr. Wahn,
Mr. Fulton,	Mr. McQuaid,	Mr. Woolliams—24.

(Quorum 10)

R. V. Virr,
Clerk of the Committee.

¹ Mr. Tolmie replaced Mr. Stanbury on May 16, 1966.

ORDER OF REFERENCE

WEDNESDAY, May 25, 1966.

Ordered,—That the Standing Committee on Justice and Legal Affairs be permitted to sit while the House is sitting to meet the convenience of out-of-town witnesses when they appear.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House.

MINUTES OF PROCEEDINGS

FRIDAY, May 27, 1966.
(8)

The Standing Committee on Justice and Legal Affairs met this day at 9.50 o'clock a.m. The Chairman, Mr. A. J. P. Cameron (*High Park*), presided.

Members present: Messrs. Bell (*Carleton*), Cameron (*High Park*), Guay, Honey, Latulippe, Mather, Ryan, Tolmie, Trudeau, Woolliams (10).

In attendance: The Honourable C. M. Drury, Minister of Defence Production; Mr. W. H. Huck, Assistant Deputy Minister Supply, Department of Defence Production and Mr. J. E. Hanna, Canadian Government Specifications Board.

The Chairman tabled the following publications that he had received from Senator Warren G. Magnuson, Chairman of the Committee on Commerce, United States Senate:

Bill S.3005 regarding Safety Standards for motor vehicles; Committee on Commerce—Legislative Calendar, April 1, 1966; Traffic Safety Hearings, Committee on Commerce.

Moved by Mr. Ryan, seconded by Mr. Tolmie,

Resolved,—That the said documents be identified as exhibits 1, 2 and 3 and be held with the records of the Justice and Legal Affairs Committee.

The Chairman introduced the Minister of Defence Production who presented a brief concerning the activities of his department in relation to the drafting of an Automotive Vehicle Safety Code.

Following the presentation, the Members questioned the Honourable Mr. Dury.

On behalf of the Committee, the Chairman thanked the Minister and at 10.55 o'clock a.m., the meeting adjourned to the call of the Chair.

R. V. Virr,
Clerk of the Committee.

EVIDENCE

FRIDAY, May 27, 1966.

● (9.45 a.m.)

The CHAIRMAN: If it meets with the approval of the Committee, I am going to ask Mr. Drury to proceed and hope that later on we will have ten and validate the decisions. Is that agreeable?

There was a meeting of the steering committee yesterday. There were no minutes taken because I did not know whether it was going to take place or not; I sent the secretary back.

Just one or two short announcements. On Tuesday, June 7, Dr. Ward Smith, Ph.D. and Mr. R. M. Anthony, representing the Canadian highway safety council will be here. We have permission to sit that afternoon if we cannot conclude the hearings in the morning sitting. I have also been given the name of Dr. Lucas who is supposed to be a breathalyzer expert from the University of Toronto. We have already had Dr. Troup who is an expert on the matter, and Professor Ward Smith is also considered an expert. I did not think myself it was necessary to have three of the same classification, and the steering committee agrees with me that probably we would not call him unless there was a demand for it.

I have a letter from Senator Magnuson the chairman of the commerce committee of the U.S.A. Congress and he has sent a lot of material here. Bill S-3005 to provide for a co-ordinated national safety program and establishment of safety standards for motor vehicles and inter-state commerce to reduce traffic accidents and the increase in death and property damage which occurs in such accidents; the hearings are before the Committee on Commerce of the United States Senate with respect to Bill S-3005 I would entertain a motion that these be made an Exhibit to the day's proceedings.

Mr. RYAN: I so move.

The CHAIRMAN: Moved by Mr. Ryan, seconded by Mr. Tolmie. All those in favour?

Motion agreed to.

The CHAIRMAN: The Minister of Industry is here, together with officials from his Department who are going to discuss, as I understand it, a proposed code, or something of that nature, in regard to safety devices. We have had Mr. Southam, Mr. Wahn, Mr. Grafftey, and we had a moving picture in regard to safety devices. I think the Committee are in agreement that unless somebody wants it, we will not be calling any more witnesses after Mr. Drury, in regard to safety devices. We will proceed to prepare our report on the subject matter referred to us. Is that agreeable?

Agreed.

Well, then, Mr. Drury, you need no introduction to this Committee. You may wish to introduce the two gentlemen who are here with you.

Mr. DRURY (*Minister of Defence Production*): Yes. Mr. Chairman, with me today I have Mr. Huck on my right, who is the assistant deputy minister of the Department of Defence Production, who has an over-all responsibility in so far as my ministerial responsibilities are concerned with the automobile safety code; and also a representative of the Canadian Government's Specifications Board, Mr. Hanna. It is the Canadian Government's Specifications Board, as I will make clear, which is undertaking the basic preparatory work and the co-ordination of the preparation of an automobile safety code.

● (10.00 a.m.)

Let me say at the outset that the government is much concerned with the very high level of damage, both human and material caused by road accidents which seems in the past year to have been increasing rather than decreasing. The extent of this has perhaps raised it to the level of a national rather than a local problem. In response to this rising and recognized need, last September I issued a press release announcing that the Canadian Government Specifications Board had been asked to prepare an automobile vehicle safety code. Because most legislation dealing with motor vehicles is provincial and the regulation of automotive traffic is exclusively a provincial jurisdiction it seemed clear that the proposed code would have to be a recommendatory rather than a mandatory documents for the guidance of government agencies, industry, commerce and the general public. It was decided that the proposed code should comprise or cover three main areas of interest: the human factor, the mechanical factor and the environment.

The code would thus consist of three parts which I might describe briefly as follows:

Part 1 of the code would deal comprehensively with aspects of the human factor in relation to traffic safety and present recommendations for bringing about the improvements in respect of this.

Part 2 of the code would deal comprehensively with safety features and accessories related to the safe operation of automotive vehicles and would be intended to achieve the highest practical degree of mechanical safety in the operation of such vehicles. Included in this part would be a compilation of performance standards covering known safety devices.

Part 3 of the code would deal comprehensively with aspects of the environmental factor, mainly the road itself, of course, in relation to traffic safety and would present recommendations for achieving improvements in this regard.

The proposed automobile safety code would, I would suggest, be useful in that it would for the first time, and from a single authoritative source, make available a logical codification of the best information on the cause and prevention of accidents; secondly, provide information on the relation between driver capabilities and accidents; thirdly, furnish a set of standards for safety features for incorporation into specifications for vehicles purchased by all levels of government, industrial and commercial organizations and hopefully the general public. It would provide information on the relation between the road

environment and accidents, and encourage the proper use of existing safety features. It would assist purchasers in the wise choice of a vehicle by giving top priority to its safety features. It would encourage proper maintenance of all vehicle safety features. It would indicate areas for further research in the human, mechanical and environmental factors that contribute to accidents, and it would finally encourage and promote greater uniformity in the legislation that generates regulations controlling licensing of drivers, vehicle inspection and maintenance, traffic signs and enforcement of rules of the road.

It may be of interest to add that the government has already authorized the inclusion of a number of safety standards in the specifications for vehicles it is currently purchasing for use by its various departments and agencies.

I am pleased to report, Mr. Chairman, that the three parts of the code have now been completed in a preliminary draft and that the printing of the entire draft code should be completed by the end of this month. Copies will in the first instance be submitted for study by the members of the committee set up for this purpose by the Canadian Government Specifications Board. That committee, which will give it first study, has representations from the provincial governments, agencies of the federal government, the Motor Vehicle Manufacturers' Association and a number of organizations interested in the various aspects of the highway safety problem.

The first meeting of the CGSB Committee will be held in Ottawa on 20-21 June 1966.

Hopefully, the code will serve its intended purpose. Admittedly, it cannot of itself solve the complex traffic accident problem. What more could and should the government do? For one thing, it has been asked to take the lead in co-ordinating a continuing, more direct national effort towards the reduction of the traffic accident rate to the lowest possible limit.

While much research has already been done in this field, it is evident that there is need for continuing research to develop further information and to update the revise earlier findings. There is also the problem of utilizing present knowledge, which also would require co-ordinated effort.

The government is therefore considering what role it may usefully play in co-operation with the provincial governments. Theirs is the jurisdiction and responsibility in regulating the human and mechanical and environmental factors contributing to the traffic problem. It may be that the Federal Government can make a unique contribution within the context of research investigation, the flow of interprovincial traffic and export-import trade. This possibility is being studied by the several departments whose responsibility it is to bring them within the spectrum of the traffic problem. This in brief then, Mr. Chairman, is the present indication of what the federal government, as a government, is doing, and if I can clarify or expand any of this, or answer any questions I would be glad to do so.

The CHAIRMAN: Thank you very much, Mr. Drury, and I know many will want to ask quite a few questions. Mr. Tolmie I see has his hand up, and Mr. Honey, Mr. Mather.

Mr. TOLMIE: Mr. Chairman, I was wondering what amount of liaison there has been for example, between the Ontario government and the federal

government in the drafting of the code. For example, we have now a proposed code. Is it not possible that Ontario put out a code which may in certain respects differ and be contrary to certain recommendations in the code that you now are putting forth?

Mr. DRURY: There has been informal liaison between the Ontario government and the federal government. They are aware of what is being done, and they are going to participate as members of the committee I just mentioned, in studying and either approving or suggesting changes in this draft code.

You will be aware that the legislation proposed by the Ontario Minister of Transport is of a rather general and permissive character, and if it is passed it will not, in legislative form anyhow, tie the Ontario government down to particular rules, but rather a general framework in which rules can be made. One would hope that arising out of the discussions between the federal-provincial and other bodies at the meeting on June 20-21, some consensus might be obtained as to what would be the kind of rules which would be appropriate on rather a national scale, but probably to be put into effect by the provincial governments.

Mr. MATHER: Mr. Minister, we have had some evidence before this Committee and some argument, notably I think from Mr. Grafftey, along the lines that it is the responsibility and duty of the federal authority to legislate in this field on a mandatory basis to establish a safety code and to ensure that all automobiles manufactured in Canada and imported into Canada comply with this code. I am not satisfied in my own mind and I wonder as to the jurisdictional aspect of this question. From your remarks this morning I take it that the code that is now being considered by our department will be of a permissive nature or, persuasive maybe would be a better word. Can you tell me if your view or the federal authority has any opinion or are considering the matter as a jurisdictional question as between the federal and provincial authorities, with relation particularly to a mandatory code?

Mr. DRURY: There are two aspects of this question. One is the desirability of the federal government exercising a mandatory jurisdiction. The second is that if that is desirable. Then the question arises as to whether this is in constitutional terms, achievable. I do not think that the question of desirability has yet been satisfactorily resolved. You may have noticed that in the United States there is a distinct reluctance on the part of the federal government, and the federal administration, to accept mandatory legislation. They are opposing the advocacy of this by some of the members of congress.

There is clearly some evidence that the most effective means of improving the mechanical safety of automobiles is the mere fact of publicity, widespread public knowledge regarding the failure of manufacturers in some instances to achieve safe vehicles, and this has had, in at least one instance, so significant a consequence, in economic terms for the manufacturer that it is quite clear that they are probably as concerned, as anyone could expect them to be. With the necessity of ensuring that vehicles put on the road do conform to a high degree of mechanical safety, and that if in this way, it becomes desirable from the manufacturer's point of view to ensure mechanical safety, a more satisfactory result might well be achieved than if an endeavour is made by legislation to

enforce, on an unwilling group, a set of rules which may or may not be workable. So this general issue is not yet I think satisfactorily resolved.

Secondly, we have sought legal advice on the extent to which there is federal jurisdiction in this particular field. The result of seeking such advice is what one might expect, namely, a lack of precision, a lack of complete clarity. It is clear that in respect of export of mechanical vehicles, the federal government has jurisdiction, over their size, shape, form and content; that in respect of vehicles engaged in interprovincial activities that the federal government has jurisdiction, but it is equally clear that in respect of vehicles which are manufactured and used in one province alone, the federal government has no jurisdiction. It would seem to me desirable that if we can achieve the object we are seeking, of getting vehicles having a higher degree of safety incorporated in them through a voluntary co-operative effort, this is much better than endeavouring to assert what may be a questionable legislative jurisdiction.

Mr. WOOLLIAMS: May I ask a related question raised by what the Minister had to say in reference to jurisdiction, or whether you have a mandatory or voluntary approach to the subject. I think from a practical point of view—it may be a little abrupt to ask this question at this stage—the United States would really have the control of the company, and they merely have the subsidiaries here making automobiles. They set the tone for the safety, as far as automobiles are concerned, and are we not if we are practical and honest with ourselves, as Canadians, controlled by the approach from the United States as far as the automobile industry is concerned. I am thinking in particular, when we were talking about exporting automobiles to a Communist nation manufactured here in our own subsidiaries of United States Companies and their law prevented those companies from selling and trading with those countries and the Canadian subsidiaries did do it. I am not passing any criticism of your government because it happened under ours as well. It is a practical problem and I just wondered what your approach is to that.

Mr. DRURY: There is no question about it that motor vehicles are designed, and to an increasing extent being manufactured, on a North American continental basis. As a consequence the degree of complete independence we have to prescribe what are going to be the features incorporated in cars which operate in Canada is in a practical way, rather limited. Obviously we could prescribe that no car having more than three wheels, for instance, could be imported into Canada, but this would rather disrupt the whole scheme of motor transportation in Canada, in that the Americans seem to have a preference for cars with four wheels. They are likely to go on manufacturing cars with four wheels, and perhaps not pay too much attention to this three wheel Canadian demand.

This is a hypothetical case but it does support what you are saying, and probably we can be most effective in the field of organizing information and doing research work leading to conclusions which will appeal not only to the manufacturers but also the United States administration. Because they are good, sound and reasonable.

The United States administration itself, apart from any legislative arrangements is laying down for all federal government purchases, and these are in some numbers, safety standards for the vehicles that they buy. If the United

States administration can secure the support of a couple of the larger states for insisting on the same standard in respect of their operation, then this practically sets the pace for the whole North American market. In this sense, the Canadian market is analogous to one of the, not the largest state, but one of the larger United States states, in terms of consumption.

Mr. WOOLLIAMS: Well, I am inclined to agree with your statement, Mr. Minister.

Mr. MATHER: Mr. Chairman I wanted to say that I think the general approach being made by the Minister and his assistants to this problem is an excellent one, in line with the explanation of the three-way code which is being aimed at dealing with the vehicle, the driver, and the road. I realize and recognize the constitutional difficulties involved if legislation were favoured by the government, but I point out, as you have said earlier, the traffic toll is now really a national thing in its ramifications. We are killing a hundred people a week. You know the figures as well as or better than I do. All our traffic safety bodies are organized, and many of the major ones, on a national basis because this is really an interprovincial-national problem. Canadians are more and more mobile. We are not just driving in one area or province, but we drive across and we drive north and south. What I would like to see you and the department do, when you get this committee which is going to be dealing with the proposed code, if through whatever considerations they are going to give to this, is to emerge with a target of getting interprovincial action under federal leadership.

● (10.15 a.m.)

It is true that toward traffic safety and the adoption of legislation, the Americans control or influence a good deal of the safety features, or lack of them in Canadian cars, but as you have indicated, this is only one of the three elements involved here. The others are the signing, road traffic signing, and the road conditions, grading, and so on, and of course, the condition of the driver. That brings up one thing, in my particular interest there, but certainly the driver is a very important element in accidents, or freedom from them. So, in brief, I like the approach. I think it is a very good one, taking in all the aspects concerned. I fear that it will not be effective unless eventually we come to some interprovincial type of legislation making this safety code mandatory. I would urge that consideration be given to that idea.

Mr. BELL (*Carleton*): I have two matters. Mr. Drury has spoken of the jurisdictional problems and I assume that an opinion of the law officers of the crown has been secured in respect of this and I am wondering whether he would feel disposed to make that opinion available to members of the Committee for the guidance of the Committee.

Mr. DRURY: I am told that it is not the practice to publish these.

Mr. BELL (*Carleton*): I think it is true that it is not the practice, although it has been done on a number of occasions.

Mr. WOOLLIAMS: There was a great demand, for a legal opinion on the subject.

Mr. DRURY: Yes, I seem to recollect some discussion in that respect. If the Committee feels that this would be of critical importance to their deliberations,

then I might be persuaded to do it. But I do not think one would want to establish a precedent of this kind; if it is not really of cardinal significance.

Mr. BELL (*Carleton*): I would not describe it as of cardinal significance, but it does seem to me that this is an important field and while the Minister's statement has been reasonably clear, I think we should have on the record as much detail as possible. I think there is very considerable misunderstanding in Parliament as to what the legislative jurisdiction is in this field.

Mr. DRURY: Well, let me say that this document will not help too much to clear up this misunderstanding but rather to reinforce the notion that it is unclear in some aspects. It is clear that in so far as motor vehicles produced and used in a province are concerned, these fall under provincial jurisdiction and not under federal jurisdiction at all. It is clear that vehicles produced for export or for interprovincial use fall under federal jurisdiction. Now, the problem is to try and separate in this field rules governing cars which are for export and those which it would be argued are used exclusively within a province. These cars all coming out of the same factory and during the process of manufacturing it may not be too clear where they are going.

Mr. BELL (*Carleton*): Most of them come out of a factory in Ontario and a great many of them go to other provinces. The mere crossing of the boundary does not bring them into interprovincial trade?

Mr. DRURY: Yes. This interprovincial trade in this country, however, is a basis for federal jurisdiction which has not over the years very seriously been put forward by federal governments. As you know, in the United States this is the whole basis for federal regulation of almost all internal commercial activities.

Mr. BELL (*Carleton*): It has only been defined in the Winner case here, I think.

Mr. DRURY: That is right. And in a sense, one would be starting off on a new, perhaps challenging, perhaps exciting tack, if one were to start this; but my own feeling for the moment is, rather than trying to achieve our objects through jurisdictional or legislative gambits, it would be better to try first the avenue of seeking co-operation.

Mr. BELL (*Carleton*): I will not press the matter, Mr. Chairman, on the production of the opinion, perhaps except to suggest to Mr. Drury, that he might consider it with his officers and with the deputy minister of justice, and if they saw no objection I think the Committee would welcome it. If they do see objection, and I am anxious not to establish bad precedents, in the situation, I will not press it at all.

Mr. WOOLLIAMS: I wonder if I could ask one related question in reference to jurisdiction. It might be the time to put it on the record. Of course I have not seen the legal opinion, and what Mr. Bell said, and what you have discussed with Mr. Bell, and I question whether we do have jurisdiction; but it does seem to me, when you are considering this problem, as the federal government controls the use of drugs for human welfare, in a sense, the protection physically and mentally and the human welfare of the person, safety in an automobile is certainly for the human welfare or the protection of the human

being. There might be a new principle of jurisprudence established here in the interpretation of the jurisdictions. We might be putting it on a different basis, and that is what develops the precedents we might need it if it came to the position where we are going to legislate in this field in a mandatory way. Then of course, an opinion of the Supreme Court of Canada in this regard in the usual way could be obtained. I just throw that out as a thought.

Mr. BELL (*Carleton*): The other point that I wanted to ask Mr. Drury about was when he anticipated that the draft code would be made publicly available.

Mr. DRURY: As a draft?

Mr. BELL (*Carleton*): As a draft.

Mr. DRURY: I might just indicate to you that membership on this Committee is being sought—probably it might be better described as a Conference rather than a Committee Meeting—from—the All Canada Insurance Federation, the Automotive Industries Association, the Automotive Transportation Association of Ontario, the Canadian Conference of Motor Transport Authorities, Canadian Federation of Mayors and Municipalities, Canadian Good Roads, the Consumers' Association, the Motor Vehicle Manufacturers Association, Friction Material Standard Institute Incorporated, Professional Institute of the Public Service of Canada, Rubber Association of Canada, the L'Association des Médecins de langue française du Canada, the Canadian Automobile Association, the Canadian Forces Medical Services, the Canadian Foundation on Alcoholism, the Canadian Highway Safety Council, the Canadian Public Health Association, the Defence Research Board, the Department of National Health and Welfare, the Medical Research Council, Canadian Forces Headquarters, a large user, the Dominion Bureau of Statistics, the Government Motor Vehicle Committee, the Department of Industry, the National Research Council, the National Aeronautical Establishment, the Department of Public Works, the Department of Transport, the provinces of Alberta, British Columbia, Manitoba, New Brunswick, Newfoundland, Nova Scotia, Ontario, Prince Edward Island, Quebec, Saskatchewan; the Alberta Safety Council; the Safety Council of Newfoundland; the Nova Scotia Highway Safety Council; the Ontario Safety League; the Prince Edward Island Provincial Safety Council; Saskatchewan Safety Council; the province of Quebec Safety League; and the British Columbia Safety Council.

I indicated that to say that while it was not intended to publish as a document, in draft form, this will be provided in advance of this conference to all these organizations, so that in a sense it will be pretty well published, even though only a draft document. But it was not our intention to publish it, at least in official form, so to speak, until such time as it has been considered by these people who have some specialized knowledge and a particular interest in the matter.

Mr. BELL (*Carleton*): It will be released to them on a confidential basis.

Mr. DRURY: That is correct.

Mr. BELL (*Carleton*): But not for publication? Then my next question would be whether you felt disposed to allow the Committee to have access to it. I assume that in view of your proposal there, that would probably not be your wish at this stage.

Mr. DRURY: It would not seem to fit the plan.

Mr. RYAN: With respect to the human area, Part I of the proposed code, what human factors will be considered by the Committee? What factors are presently being proposed to be incorporated into this code? Are they factors such as alcoholisms, colour blindness, or just what, Mr. Chairman?

Mr. DRURY: I think the two you mentioned are generally regarded as being significant factors in contributing to accidents and undoubtedly these will be looked at and it is one of the reasons why the Institute on Alcoholism has been invited to participate in this. They have specialized knowledge.

Mr. RYAN: Are there other human factors that you are in a position to advise us of at this time that will be considered.

Mr. DRURY: Now, I do not pretend to have any detailed knowledge of this. There are a number of representatives of the medical profession, through the Department of National Health and Welfare, the Medical Research Council, the National Research Council, and the Traffic Injury Research Foundation, who will be there and presumably will bring to bear factors, both physiological and psychological. I will not try to guess at what they all might be. I would frankly be guessing, if I were to do so.

● (10.30 a.m.)

Mr. RYAN: But at the present time your department is not proposing that certain specific factors be considered. You are not putting it before this conference?

Mr. DRURY: Yes, included in the code will be a list of these factors.

Mr. RYAN: Could we have some foreknowledge of that, or is it not permissible at the present time?

Mr. DRURY: In a general way, I do not think there is any secret about this. I have some headings here which I will indicate to you: vision; visual acuity, visual fields; eye muscle imbalance; colour blindness; hearing; heart diseases—that covers quite a lot—diabetes; disease of the respiratory system, mental diseases; and not qualified as a disease, but mental deficiency; epilepsy; disorders affecting muscular control or co-ordination, narcolepsy, whatever that may be.

An hon. MEMBER: A sleeping condition, a tendency to fall asleep easily.

Mr. DRURY: Sleepy, oh. Disease of the muscle and skeleton; alcohol; carbon monoxide; drugs; sedatives and anaesthetics; tranquillizers; stimulants; pain relieving drugs; antihistamines; drugs preventing motion sickness. That is the physiological.

Then there is the psychological heading: Attitudes and driver education; accident proneness; emotional disturbances; fatigue. Then a consideration of medical examinations and the circumstances under which they should be held or not; human engineering, does that mean anything? This term human engineering is relatively new, having come into general use during the second world war; it was applied to the cockpit design of aircraft and based on the concept that the machine is a functional extension of the human operator. Does that give an indication?

Mr. RYAN: That is fine. It is a pretty broad spectrum on it.

Mr. DRURY: The genesis of those headings really came from the traffic Injury Research Foundation, which is a national organization devoted to research in these matters.

Mr. BELL (*Carleton*): Does heart disease include one-arm driving?

Mr. DRURY: I think that comes under the heading of psychological department.

Mr. TRUDEAU: Mr. Chairman, I am inclined to agree with the persuasive approach which was suggested by the Minister, but I wonder if he could tell us how persuasive it is intended that this code become. It would seem to me that if the intention is merely to try and persuade the manufacturers, the effect might tend to be rather slight, because they are strong enough probably to not submit to persuasion as he indicated in the hypothetical case of the three-wheel car, but if you try to persuade through the market forces and persuade the consumers and warn consumers against certain types of vehicles, it would seem to me that the persuasiveness might be more effective. In other words, if you certified certain cars, to use the movie analogy "X" or universal or adult, it has been shown in the movie industry that this is sufficient to keep large flocks of people away from certain types of movies, and it does hit the producer.

Mr. DRURY: It also has the reverse effect, it tends to draw large flocks of people.

Mr. TRUDEAU: Certain people you may know, Mr. Minister, but seriously it has been demonstrated that in the cases of families and people going out in groups, and the universal, and adult and works the way it is intended to work. Never mind the analogy, but in the case of the automobile, it would seem to me that if the persuasiveness were to be effective at all it would have to hit the manufacturer or the distributor in an economic sense, and to do that you would have to frighten away consumers from using certain types of vehicles equipped with certain types of gadgets. I was just wondering if the thinking of the code had gone far enough to permit you to answer this question. Will there be any kind of periodical publication which will say, well this year this car is lousy from such a point of view, and it is dangerous and we suggest you do not buy it?

Mr. DRURY: There has been no thought of, in effect, doing a safety analysis of each car, although this may arise, at some future date, and be done. There will be an endeavour made to argue the virtues of certain safety features so that people when looking around to buy a car will be aware of these and the disadvantages of not having them when they are purchasing.

Mr. TRUDEAU: They will be aware of them if they read the code.

Mr. DRURY: Well, the code to be effective in itself, as a document, will be inadequate. There will have to be some form of popular reproduction of the code itself. I would agree with this.

Mr. TRUDEAU: There has not been too much preparation as of yet, given to this.

Mr. DRURY: No. I just might say that I agree with you that the most effective sanction is an economic one. I personally believe that the easy, simple way to cut passenger and driver injury to about one third of its present level, is to have everybody in the car wear a shoulder harness and seat belts. And you could forget almost all the rest of them. Whether it would be possible to legislate the continuous wearing of these harnesses—they cannot even do it on aircraft. On the aircraft it is persuasive—whether it would be possible to legislate the continuous wearing of these or not, I do not know, and to make it an offence to be in a car not wearing one, I do not know. But there is a possibility that the insurance companies might be able to provide a lower premium or a higher scale of benefit for accidents involving cars where all the occupants are wearing seat belts, as compared to where they are not. This is something the driver understands unless he and his passengers are compelled to wear seat belts they are going to suffer an economic penalty, then perhaps it might be done. But these are all possible avenues.

Mr. TRUDEAU: As I said, I agreed with the persuasive approach as a start, but we could we hear a little more about the compelling approach. We were talking about federal jurisdiction and we did not say much about the Criminal Code powers of the government of Canada and in the event that this legal opinion should not be submitted to the Committee, or in the event that it should not have tackled this aspect of it too much, I would like to ask the Minister a few questions along that line. I realize that his Department is perhaps not the one to have entered into an exhaustive study of the criminal power of the federal government, but could I ask, Mr. Chairman, if in this opinion there has been much thought given to this aspect of it. I think that there is no doubt that the criminal power of the central government can be used to prohibit the use of lethal objects, or the lethal use of non-legal objects, or whatever way you want to put it. I am not sure how effective that could be. Have the legal officers looked at the possibility of defining a car, or certain parts of a car, as liable to cause mischief or death or as being dangerous?

Has there been any analogy made with, for instance, the alcoholics situation when the federal government entered the area of temperance under its federal power? It was alleged that alcoholism had become such a national calamity that this was now under federal jurisdiction, that the federal government could legislate upon it, and it did, and if we, under the analogy, arrive at the conclusion that highway accidents are also reaching the proportions of a calamity, it seems fairly certain that the federal government could legislate in a prohibitive way. Has there been any study given to the kind of prohibitive ways we could use? I am not talking of the human factor here, alcoholism, and so on; I am talking about the lethal object itself.

Mr. DRURY: No. We have not, quite frankly, got this far. The attempt basically being made now is to define the problem. There are a great many ideas around as to what the problem is. But until there is perhaps a little more hard knowledge and a rather more concrete definition of the problem, I do not think it would be wise, and we do not attempt to try and do them, and we are not going, to try to produce solutions.

Mr. TRUDEAU: Well, I agree, until you know exactly what the problem is and what kind of thing causes the mischief, it would be unwise to try and make

the use of such a thing a crime, but as you say the knowledge itself has not reached that point yet. Thank you.

Mr. MATHER: Mr. Chairman, a question somewhat along the same line only in regard to the place of the human factor in this proposed code. I noticed that the Minister included alcohol and its use as part of the human ingredient there. As we know, in the present Criminal Code, there is recognition of the breathalyzer test on a permissive basis in regard to drinking and driving. My question is—and I preface it again, if I may, by stressing what I think is the necessity of getting national action rather than local action on this—Could consideration not be given to amending the Criminal Code, in line with what we hope the safety code will be, to provide a mandatory test for alcoholism in driving? If this were done, I think that you would find, in effect, you would have a national basis, a federal basis, for one part of your proposed safety schedules and codes.

Mr. DRURY: I plead almost complete ignorance on this particular topic, and would hesitate to give any kind of opinion at all. I only know vaguely what a breathalyzer apparatus is. The extent to which it has been proved out as producing conclusive results or not, I do not know. I notice there is some dispute about this. I would certainly want to be a lot better informed on this particular topic before giving an opinion on whether breathalyzer tests should be made mandatory.

Mr. MATHER: Recently, several of the provincial attorneys general have indicated that they want that to be done.

Mr. DRURY: I would hope there would be some discussion of this at the forthcoming conference and perhaps some consensus of opinion reached there.

Mr. HONEY: I have just one question, Mr. Chairman. During your answer, Mr. Minister, to my first question you made a remark with reference to the persuasive effect of public opinion on manufacturers and you referred to, I think your words were, a dramatic event, or at least words to the effect that on one occasion manufacturers had given a great deal of weight to public opinion. I wondered, without giving the details of the manufacturer and so on, but to assist this Committee which has had evidence before it to the effect that manufacturers are pretty difficult to persuade, if you could give us any details of this particular, again without divulging the name of the manufacturer.

Mr. DRURY: There is one motor car which has been described as unsafe, structurally unsafe, for reasons which I do not think the public too clearly understand; so there is as a consequence perhaps an unknown fear of this car, and sales of it have virtually ceased in the United States. Faced with this kind of circumstance, if a manufacturer wishes obviously to manufacture and sell his product and to continue to do this, he is going to take rapid steps to remedy both the defect and the bad impression created. This has been, I think, rather a salutary example of what effect adverse publicity in relation to the essential safety worthiness of a car can do to the manufacturer's business. I think you will find a much greater preoccupation on their part with seeing that this kind of thing does not happen in the future.

Mr. HONEY: You indicated that sales had virtually stopped; is this a recent development in this year's model?

I am not familiar with the car but I am wondering how recent is this development?

Mr. DRURY: Well, the car I heard about—I do not particularly want to name names here—

Mr. HONEY: I think we know the car anyway, but—It is not particularly this year's model, is it?

Mr. DRURY: It is not particularly this model year, no.

(Translation)

Mr. GUAY: I would like to know whether, in the implementation of the Code which you have proposed, it will automatically be necessary to amend the Criminal Code so as to eliminate any possible conflict with the Criminal Code?

Mr. DRURY: As I said earlier, the proposed Code is not issued yet. It just comprises a series of proposals which will be recommended to the public at large, to the manufacturers, to the Provincial Governments and even to the Federal Government. The means or follow-up action depend on the nature of the proposals themselves. There will be some which will perhaps require amendments to the existing rules governing export. There will be other proposals which will require amendments to the rules or regulations or Provincial Governments in the field of cars operating on highways. There will be others that will require amendments to existing legislation on drugs. It all depends on the nature of the proposal, and perhaps there will be amendments required also to the Criminal Code, but at this moment I do not know.

Mr. GUAY: You do not know.

Mr. LATULIPPE: I would like to ask you a question. First of all, I would like to thank you for the wonderful job that you are doing in trying to equip cars with safety devices so that the public can drive safely, but I believe, Mr. Minister, that it will be necessary to make mandatory certain types of construction on these cars, in particular the chassis of these cars, so that they should be designed to absorb shocks, impacts, because it is the impact of a car that is the cause of a great many deaths in the case of faulty construction. In particular, as regards to imported cars, the chassis are very light metal or the frame is absent altogether, and in the case of accidents the people are crushed by the cars themselves, as if they were inside an accordion, while in Canadian cars, the safety level is a bit higher. They absorb a great deal of impact because the chassis is stronger, whereas imported cars, because of the way they are constructed today are certainly not very safe, and even our Canadian cars should have more safety devices, in particular to absorb impact. In any case I think we need some strengthening. For instance, let us look at the hard-top cars. People can be crushed by the top if it is not sufficiently strong, so I think it would be necessary for the Code to stipulate that certain safety devices should be fitted. We should certainly strengthen the structure of the cars and certain parts of the cars so as to give them great shock absorbency, in any event.

Mr. DRURY: Can I ask you a question, should we prohibit the driving of cars without any tops whatsoever?

Mr. LATULIPPE: Not only should we prohibit that but we should also endeavour to give them a greater number of safety devices or to strengthen the top.

Mr. DRURY: I am thinking of completely convertible cars which have no hard-top whatsoever. Should we prohibit the existence of those cars?

Mr. LATULIPPE: As regards to safety, frankly I do not know.

Mr. DRURY: I would like to have your advice, should we prohibit them altogether?

Mr. LATULIPPE: Perhaps, because for citizens who want to have certain high safety levels, something will have to be done if we are going to let the manufacturers go ahead and build convertible cars. People are killed in those cars, because the cars are not sufficiently strong, there may be some other devices. A car may be convertible but they may put in some other type of safety device. I do not know. Maybe they can put in some other safety device, maybe they can get organized and improve the situation.

(English)

The CHAIRMAN: If there are no more questions, then, Mr. Minister, on behalf of the Committee I would like to thank you very, very sincerely for your presence here this morning, for the presentation and information you have supplied us with, and also for bringing your Assistant deputy and his associate with you. We know the information that you have given us will be very valuable when the Committee is considering its report.

With reference to the legal opinion, if after consultation with your officers and the Department of Justice you feel you can release it, I think you can release it on the basis that it will be treated in confidence by the members of the Committee, at any rate. Thank you very much indeed.

Mr. DRURY: Thank you, Mr. Chairman. I am grateful to the Committee for the interest they are taking in this problem which is really a serious one. The more people who do take an interest and are helpful like the Committee, the more grateful we are.

The CHAIRMAN: Thank you very much.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE
No. 8

TUESDAY, JUNE 7, 1966

Respecting the subject-matter of

- Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).
Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).
Bill C-87, An Act to amend the Criminal Code (Impaired Driving).
Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles), and
Private Members' Notices of Motions Numbers 26 and 31.
-

WITNESSES:

From the Canadian Highway Safety Council: Mr. R. M. Anthony, Chairman, Laws and Enforcements Committee; Dr. Ward Smith, and Mr. W. F. Bowker.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Honey,	Mr. Ryan,
Mr. Asselin (<i>Charlevoix</i>),	Mr. Laflamme,	Mr. Scott (<i>Danforth</i>),
Mr. Bell (<i>Carleton</i>),	Mr. Latulippe,	Mr. Tolmie,
Mr. Choquette,	Mr. MacEwan,	Mr. Trudeau,
Mr. Chrétien,	Mr. Mather,	Mr. Wahn,
Mr. Fulton,	Mr. McQuaid,	Mr. Woolliams—(24).
Mr. Goyer,	Mr. Nielsen,	
Mr. Guay,	Mr. Otto,	

(Quorum 10)

Timothy D. Ray,
Clerk of the Committee.

ORDERS OF REFERENCE

MONDAY, May 30, 1966.

Ordered,—That the subject-matter of Bill C-176, An Act to amend the Criminal Code (Insanity at time of trial), be referred to the Standing Committee on Justice and Legal Affairs.

Ordered,—That the subject-matter of Private Members' Notice of Motion Number 38, the question of automobile safety, be referred to the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House.

MINUTES OF PROCEEDINGS

TUESDAY, June 7, 1966.

(9)

The Standing Committee on Justice and Legal Affairs met this day at 9:45 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Aiken, Bell (*Carleton*), Cameron (*High Park*), Chrétien, Honey, Mather, McQuaid, Ryan, Scott (*Danforth*), Tolmie, Trudeau, Wahn (12).

In attendance: From *The Canadian Highway Safety Council*: Mr. R. M. Anthony, Chairman of the Laws and Enforcement Committee; Dr. Ward Smith, and Mr. W. F. Bowker, Dean of Law, University of Alberta (Edmonton).

The Chairman introduced the witnesses, and invited them to make a statement with reference to the subject-matter of Bill C-87.

Mr. R. M. Anthony made a statement to the Committee.

Agreed,—That the following be filed with the Committee as exhibits: Breath Tests for Alcohol (Exhibit 4); The Development of a Large Scale Breath Testing Programme in Ontario (Exhibit 5); Use of the Breathalyzer in Ontario—1965 (Exhibit 6); Alcohol Detector Tube of R. F. Borkenstein (Exhibit 7); Drinking and Driving (Exhibit 8); The Drinking Driver, Report of a Special Committee of The British Medical Association (Exhibit 9).

Mr. W. F. Bowker made a statement.

At 11:00 a.m., the statement of Mr. Bowker continuing, the Chairman adjourned the meeting until 4:00 p.m. this day.

AFTERNOON SITTING

(10)

The Standing Committee on Justice and Legal Affairs reconvened this day at 4:07 p.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Aiken, Cameron (*High Park*), Forest, Goyer, Guay, Laflamme, Mather, McQuaid, Ryan, Scott (*Danforth*), Tolmie, Trudeau (12).

Also present: Mr. Stanbury, M.P.

In attendance: (Same as at morning sitting).

The Chairman invited Mr. W. F. Bowker to resume making his statement.

At the completion of Mr. Bowker's statement, the Committee proceeded to the questioning of Messrs. Bowker, Smith and Anthony.

At the completion of the questioning, the Chairman thanked the witnesses for their valuable contribution.

At 5:05 p.m., the Chairman adjourned the meeting to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, June 7, 1966.

● (9.45 a.m.)

The CHAIRMAN: Gentlemen, we have a quorum. I understand that Mr. Honey has a motion he would like to make at this time.

Mr. HONEY: Yes, Mr. Chairman, I would like to move that reasonable living and travelling expenses be paid to Mr. R. M. Anthony appearing before this Committee in accordance with the scale of expenses approved by Mr. Speaker.

Mr. TOLMIE: I second the motion.

Motion agreed to.

The CHAIRMAN: I have the pleasure, gentlemen, of introducing our witnesses for today: Mr. R. M. Anthony, Crown Solicitor in charge of prosecutions for the province of Alberta; Dr. Ward Smith who will be speaking on behalf of the Canadian Highway Safety Council and is, of course, associated with the Department of Justice of the province of Ontario, and Mr. W. F. Bowker, Dean of Law, the University of Alberta. We have these three distinguished gentlemen with us. I am first going to call upon Mr. Anthony. The subject matter of the bill which we are considering, is impaired driving. A suggestion made by Mr. Mather in the bill is that there be no longer an offence of intoxication but that if you are impaired to a certain degree as shown by means of a breathalyzer test then you will be deemed to be a person driving while impaired, and if you refuse to take such a test then you could be prosecuted for having failed to take the test.

Mr. R. M. ANTHONY (*Chairman, Laws and Enforcement Committee, Canadian Highway Safety Council*): Mr. Chairman, honourable members of Parliament, this submission is on behalf of the Canadian Highway Safety Council and I am making the submission in my capacity as Chairman of the Laws and Enforcement Committee of that council. I intend to deal with a historical review of the provisions of the Criminal Code and to show the need for a change in legislation as proposed in Bill C-87.

The provisions making it a criminal offence for "a man in any degree of intoxication that affects his perfect carefulness in undertaking to run a motor car" first appeared in the Criminal Code of Canada in the year 1921. This section then provided that "everyone who, while intoxicated drives any motor vehicle or automobile" is guilty of an offence punishable upon summary conviction.

The original offence section was updated by a revision in 1925 Statutes of Canada, Chapter 38 Section 5 which included intoxication by use of narcotics as well as a provision making it an offence to have care and control of a motor vehicle while in that state of intoxication.

Further revisions followed in 1930 Statutes of Canada, Chapter 11, Section 6 and 1935 Statutes of Canada, Chapter 56, Section 4 and again in 1947 Statutes of Canada, Chapter 55, Section 10. Each amendment or reenactment further refined this offence to include broader concepts of intoxication in the use of the motor vehicle, but none of the revisions attempted to assist the courts by defining what was meant by intoxication or what degrees of intoxication were to be included in this offence.

Throughout the period of time since the enactment of this legislation the courts have had to contend with the problem of interpreting the intention of Parliament when considering what was meant by intoxication. Examples of these attempted definitions can be cited in the following reported decisions:

McRae v. McLaughlin Motor Car Company (1926) 1 D.L.R. 372: This is an Alberta case, a civil case, but it involved the interpretation of intoxication. Mr. Justice Boyle in that case stated and I quote:

"Intoxication, it must be remembered, is a mental and physical condition caused by the consumption of alcohol in some form or another. Some people believe that a man who takes any alcohol thereby becomes intoxicated. In my opinion, the degree of intoxication contemplated by Parliament in enacting section 285(c), as contained in the old Criminal Code, is a state of intoxication during which, if permitted to drive a motor vehicle, it would be dangerous to the public."

Another case is *Giddings v. R.* (1947), 89 C.C.C. 346. Chief Justice Campbell of Prince Edward Island Supreme Court stated:

"Since its passing in 1921, the provisions of the Criminal Code, section 285(4)...regarding intoxicated driving has received very little reported interpretation. Appellant's counsel cited a group of cases which adopted the definition of intoxication as 'a state of intoxication during which, if permitted to drive a motor car, it would be a danger to the public.' This definition was used by Mr. Justice Boyle, in an Alberta civil case—*McRae v. McLaughlin Motor Car Company*, *Supra*,—and is no doubt correctly stated and correctly applied to the facts of that case...I do not consider that Parliament in using the word 'intoxicated' simpliciter, intended it to be refined into degrees, or intended that only an advanced state of alcoholic inebriation would constitute an offence. 'Under the influence of liquor' in any ordinary language means under the intoxicating influence of an intoxicating liquor. Not only the drunk is a menace on the highway. It is common knowledge that even mild intoxication has the effect of relaxing normal caution and inducing the taking of chances, while judgment of speed and distance are impaired and reactions to situations are retarded.

It therefore seems clear to me that a driver who is in any degree under the influence of liquor comes within the definition of Mr. Justice Boyle, as being a potential danger to the public...The question appears

not to be what degree of intoxication is proved, but what proof is required of any degree of intoxication."

The last case I would quote to you is the case of *Desbiens v. R.* (1951), 103 C. C. C., page 36, where the Quebec Supreme Court stated:

"Intoxication is the stupefied condition of a person who has imbibed alcoholic liquor in sufficient quantity to make him lose totally or partially the use of his mental or nervous faculties. To be intoxicated in the legal sense, it is not necessary to be dead drunk any more than to be ill it is necessary to be dying. It suffices that an individual be affected by alcohol to the point of no longer having his normal control, his judgment, or, in a word, that he no longer has the use of all his intellectual or physical faculties."

From the progression of the cases which have cited it becomes apparent that the courts by interpretation have placed a heavier burden upon the Crown when attempting to establish intoxication in the use of a motor vehicle. It thus became necessary for Parliament to enact new legislation to cover the lesser degrees of intoxication excluded by the then recent court decisions which narrowed down the scope of the original legislation to a point where it affected only those who were no longer in control of their intellectual or physical faculties.

Therefore, Section 285(4A) of the old Code was enacted by the Statutes of Canada 1951, Chapter 47, which created the offence of operating a motor vehicle while a person's ability to operate the said motor vehicle was impaired by alcohol or a drug. From this time on the courts and those charged with the responsibility of the enforcement of our laws have had to contend with two offences relating to the operation of a motor vehicle under the influence of alcohol or a drug. Some may say that this clarified the law in that it clearly established two levels of impairment or intoxication, which constituted offences under the Criminal Code; this assumption, however, is far from being correct because now there were two degrees of impairment or intoxication neither of which had been defined by Parliament.

The result in effect has been to almost nullify any prosecutions under the existing section 222 of the Criminal Code, revised 1955, unless the person so charged was found to be in a state where he had no control over his faculties and in most cases unable to even walk or talk, let alone drive a motor vehicle. Short of this deteriorated condition, the courts were reluctant to convict partly because of the mandatory jail sentence of seven days for a first offence; and in the alternative chose to convict the accused of the lesser charge of impaired driving which is an included offence, even though the person may have been in a state where, if found in a public place, would have warranted a charge of drunkenness under the Criminal Code but not relating to the operation of a motor vehicle.

This means, therefore, that the intent of the original legislation is not being carried out by the courts in either charges under section 222 which is for intoxicated driving or section 223 which is the section dealing with impaired driving. To obtain convictions for an offence under section 223, it must be clearly established by physical examination alone that an accused was so impaired by alcohol or a drug that he was incapable of operating a motor

vehicle safely having regard to the condition and other users of the road, and not so much merely that his ability was impaired, which is all that the law has really required.

What is the cause of the difficulty encountered by the courts in carrying out the intended meaning of the provisions of the Criminal Code? They are many and varied, but to list a few of the important considerations, one would have to consider:

- A. That the court is often not made aware of the actual amount of alcohol consumed by an accused.
- B. That the accused may have many valid pathological defences by way of explanation of his physical appearance, which at present is the usual means of judging his sobriety or impairment, such as
 - 1. Over-tiredness;
 - 2. A mild sedative reacting with alcohol;
 - 3. Physical disabilities;
 - 4. A lack of balance;
 - 5. Possible carbon monoxide;
 - 6. Hay fever or other allergies;
 - 7. Metabolism disorders;
 - 8. Neurological disorders.
- C. Further, the court is not always provided with an accurate description of the accused's appearance at the time of his arrest, due to the inability of the Crown's witnesses to accurately relate their clinical observations.
- D. And further the accused may not show the usual outward clinical symptoms found in impaired cases, but may nevertheless be adversely affected by the consumption of liquor.

All of which goes to show the rather inexpedient methods presently in use in presenting evidence to a court of law in support of a charge which relates to an accused's physiological condition at a time of operation of a motor vehicle. It is not too difficult, therefore, to see why the court is unable to carry out in any exacting manner the responsibility assigned to it in considering the guilt or innocence of a person charged under either section 222 or section 223 of the Criminal Code. It is also apparent where the courts at present only convict the more serious cases of impaired or intoxicated driving where there is a gross amount of evidence available to support the charge and thereby remove the likelihood of any reasonable doubt which may be raised by an accused at trial by way of the aforementioned pathological defences.

A summation of the foregoing would lead to the conclusion that there presently exists incontrovertible problems with regard to the current legislation governing intoxicated and impaired driving offences under the Criminal Code of Canada, and these problems can be cited as follows:

- 1. There is no precise definition of what is meant by "intoxication" under section 222 of the Criminal Code of Canada.
- 2. There is no precise definition of what is meant by the term "impaired" under section 223 of the Criminal Code.

3. There is no element of distinction by degrees or otherwise of the difference between the state of intoxication or impairment.
4. There is no means by which evidence can be adduced before a court of law in every case of the actual physiological condition of the accused at the time of his offence, other than by straight physical observation, even though the terms imply that the court must arrive at a conclusion about the accused's physiological condition before pronouncing guilt.

Having once set out the problems and their causes what, therefore, are the best solutions available to resolve these problems? A change in legislation is required to remove the distinction created between the existing offences of impaired and intoxicated driving, either by defining what is meant by those terms in a way which can be measured and tested in a court of law or, in the alternative, by removing the distinction in creating one offence which will encompass all degrees of impairment by alcohol or a drug, and to define the scope of the offence. When the law is attempting to deal with a person's physiological state at a specified time, and when there exists a means of accurately measuring that state by a scientific instrument, then provisions should be made to assist the court in its determination of the offence by making available to the court in every instance a measurement of that physiological state (blood alcohol level) taken at the time of the offence.

When consideration is being given to a chemical test as an included provision in the law, the convenience of a suspected offender must be taken into consideration. Thus tests requiring the use of medical personnel or involving an invasion of privacy (urine test) should be considered as secondary to a chemical test which can be performed with a limited inconvenience and one which will produce a similarly accurate result. In this regard, reference should therefore be made to the use of breath testing as a means of accurately measuring the level of blood alcohol prevailing at the time of an offence.

Blood alcohol testing can of course be performed in three ways; by testing either the urine, the blood, or the breath, all of which have been accepted by the courts as accurate means of measuring the physiological condition of an accused. In fact provision is made for their admissibility under the existing section 224 of the Criminal Code. At present, however, the frequency with which such tests are being made available to the courts are too few to be considered as being of much assistance in the overall picture, since it requires a voluntary act on the part of an accused before such tests may be taken and produced as evidence. Of these three accepted methods of chemical analysis, the breath analysis is by far the most widely used and accepted method of supplying this information to the courts.

● (10.00 a.m.)

Instruments designed to measure blood alcohol level by analysis of the breath have been researched and developed since the early 1950's and it is now at a point where it enjoys a high coefficient of reliability and validity when compared to any of the other means of testing for this same result. Research in the use of breath testing instruments has been carried out by many of the

reliable medical research and university institutions. I would refer you to the

Report of Special Committee of the British Medical Association of 1965 and a report of Doctor H. Ward Smith, who is here today on Breath Tests for Alcohol.

Legislation incorporating an implied consent on the part of a motor vehicle operator to partake in the supplying of a sample of breath to a police officer upon request has been passed by the Provinces of Saskatchewan, New Brunswick, Alberta, and British Columbia, and such legislation is being actively considered for inclusion by at least three other provincial governments.

There are many reported decisions from the Canadian Courts where the evidence of such tests of breath for blood alcohol concentrations have been admitted as valid evidence, tending to show a specified level of blood alcohol. I would refer you to the decision of *Regina v. McLean*, 1957, Supreme Court of Ontario, and I would also refer you to the Reference Under The Constitutional Questions Act Re Section 92(4) of The Vehicles Act, 1957 (Sask.), c. 93 which was an appeal to the Supreme Court of Canada as to the validity of the legislation which was passed in Saskatchewan in 1959.

Mr. SCOTT (*Danforth*): What was that legislation, very briefly?

Mr. ANTHONY: It is an implied consent legislation which states that the driver of a motor vehicle in Saskatchewan must submit a sample of his breath to a police officer upon request; failure to do so could result in suspension of his licence. It is an implied condition on the granting of a licence. This is the way in which it was brought forth and this is the way the Supreme Court has accepted it as valid legislation *intra vires* the province in that it did not enter into the criminal field of the provisions of the Criminal Code.

Mr. SCOTT (*Danforth*): Do the motorists in Saskatchewan, at the time they take out their licence, sign anything indicating consent to this arrangement?

Mr. ANTHONY: No. It is a rule included in the rules of the road, much the same as a person does not sign any consent form that he will not speed or that he will not do any careless driving. This is also a requirement of their legislation that he will do this. Instead of a "will not" provision it is a "will" provision.

Breathalyzers and breath testing is not peculiar to Canada, however, since in the United States there are over forty states in which chemical test legislation has been enacted with fifteen states having in addition to that legislation an implied consent type of legislation; four of which have also included legislation establishing the presumptive level of blood alcohol to be 10 per cent. As a result of this a person is presumed to be guilty of an offence if there is evidence of at least that percentage of blood alcohol in the system at the time of his arrest.

The need for an improved procedure to enforce the laws relating to the abuses of alcohol and drugs in conjunction with the operation of a motor vehicle becomes most apparent when considering the overall traffic accident picture in Canada by comparing it to the United States who are acknowledged as having one of the worst motor vehicle accident and fatality records in the world. Last year, 1965, there were 4,879 traffic deaths in Canada for approximately 20 million population; whereas in

the United States there were approximately 49,000 traffic deaths for 200 million population. Therefore, proportionately by population Canada's traffic fatality record is every bit as bad as that of the United States. Conservative estimates have been made by such authoritative bodies as the National Safety Council and other informed groups which indicate that in approximately 45 per cent of all fatal traffic accidents the drivers had consumed alcohol within a few hours before the accident. Some figures quote higher percentages, but it depends upon the areas under study, as this figure will increase in metropolitan districts. Armed with this information and the concern that should be shown for these alarming figures, it would be logical to assume that some better means of enforcement of the law is required to prevent further statistical increases in the fatality and accident rates, and that such improvements must be designed to permit easier detection of these offences by the law enforcement agencies in order to bring these people before the courts. Again, harkening back to the previous proposed alternatives, chemical breath testing analysis would lend much support to the sought-after solution of improving our existing enforcement techniques.

Should chemical analysis of the breath be made a compulsory requirement of the law? The answer to this is yes! The reasons for this requirement are rather obvious when consideration is given to the circumstances in which such tests are required, and to the need for uniformity of enforcement of our laws. In the Province of Ontario at present a voluntary breath testing program has been under way since 1956 and the records will show that when this system was first put into operation approximately 94 per cent of those requested to supply a sample of breath complied. However, with the passing of time, and as people become more experienced in the use of this machine from prior encounters with it, the rate of refusal has increased to a point where now approximately only 74 per cent of those requested will supply a sample of breath voluntarily. What about the other 30 per cent? Why should they be permitted to escape a system of efficient enforcement of the law by refusing to voluntarily submit to a breath test, especially when one considers that a great proportion of that 30 per cent are repeated offenders and comprise the hard core of our current enforcement problems. It is almost a certainty that an operator of a motor vehicle who is involved in a serious motor vehicle accident where death or injuries resulted, and who is suspected of being either impaired or intoxicated, will not voluntarily submit to a sample of his breath. This is especially true when he knows that not only might he stand liable for prosecution of an offence relating to section 222 or section 223 of the Criminal Code but also that he may be held accountable for the consequences of his actions relating to the operation of his motor vehicle and the death or injuries which followed. Therefore the principle behind the operation of the voluntary chemical test situation does not hold up in practice when it permits the serious offenders and the repeaters to escape detection by refusing to submit to a voluntary test, when more law abiding citizen may, out of sheer respect for the law and our judicial system submit to a test voluntarily, which could result in his or her conviction. This situation cannot help but create contempt for our laws in the minds of

the citizens of this country if such inequitable enforcement techniques are permitted to exist without some change.

Would compulsory breath testing legislation create a hardship or impose any fetters upon our basic freedoms and human rights? I would submit to you the answer is no! No more than does existing legislation that is designed to effectively deal with any similar problems of enforcement. Examples of similar obligatory requirements being placed upon the public can be found in The Customs and Immigration Act, The Identification of Criminals Act, the powers of arrest provided for under the Criminal Code, the powers of search and seizure provided for under the Criminal Code, and many other federal and provincial acts which provide for outright confiscation of property before the matter is even brought to trial. However, one must remember that a person is not convicted upon the evidence of breath analysis alone, nor is he convicted without a trial, at which time he may present a defence and cross-examine the Crown's evidence. This evidence cannot be equated to a confession of guilt as has been suggested by some of the opponents to this proposed form of legislation, as this more closely resembles the type of evidence obtained by a physical search, in that it does not involve a human relationship factor (such as the interviewing police officer and an accused in the obtaining of a statement for admission) but results in the obtaining of physical evidence which may or may not have a property which may produce evidence of the offence. It is much like taking an ash tray from the scene of a crime and searching the ash tray for fingerprints which may indicate the presence or lack of presence of the accused at the scene. The property taken, the breath, may or may not indicate the offence but it is a physical property we are looking for and not a mental admission.

In deciding whether Parliament is justified in requiring breath tests to be compulsory, we must weight the imposition upon the individual against the evil that we are trying to suppress. The taking of a breath test does not involve even the slightest intrusion on the bodily integrity of an accused, and surely Parliament is entitled to require that a person may not drive with a specified amount of alcohol in his blood; and that the dice should not be loaded in favour of the law breaker by allowing a suspected offender to invoke human dignity as a basis for defying our laws with impunity.

In conclusion, it is therefore respectfully submitted on behalf of the Canadian Highway Safety Council that the proposed amendments as contained in Bill C-87 be adopted as much-needed legislation to assist in controlling the offences related to the use of alcohol or a drug in conjunction of the operation of a motor vehicle. In particular, the Canadian Highway Safety Council goes on record as endorsing the principles heretofore enunciated, but with specific reference to the following needs:

1. Clarification for existing legislation contained in section 222 and section 223 of the Criminal Code to remove the distinction created, or to clarify those distinctions by concise, workable definitions of the existing terminology.
2. The enactment of compulsory breath testing legislation to assist in the enforcement of these offences to better assist the courts in arriving

at a conclusion in pronouncing the guilt or innocence as the evidence may apply to the offence.

3. The retention of provision providing for the admissibility of voluntary chemical tests of blood and urine as an alternative to breath tests, where such test cannot be administered, and in cases where the offence may relate to the use of drugs in conjunction with the operation of a motor vehicle. It should be noted here that chemical breath testing does not indicate the presence of drugs in the system of the accused.
4. The retention of provisions making it an offence to have care and control of a motor vehicle while ability to operate the said motor vehicle is impaired by alcohol or a drug.
5. The establishment of an arbitrary level of blood alcohol concentration which would be presumptive evidence of an offence without suggesting what level that might be.

All of which is respectfully submitted to this Committee by the Canadian Highway Safety Council.

The CHAIRMAN: Thank you very much, Mr. Anthony, for your very interesting and very instructive statement. Now, the usual custom here is to allow questions to be asked and, with your permission, we will do that.

Mr. AIKEN: Mr. Chairman, on a matter of procedure, since the witnesses today are all on approximately the same ground, I wonder if it would be more convenient if we heard the witnesses first and then proceeded with questioning. Then we would not find at the end of the meeting we have not heard from some of them. If we proceed to hear the witnesses we might then continue with the questioning.

Mr. SCOTT (*Danforth*): Mr. Anthony seems to have dealt with a specific area, that is, sort of a statistical breakdown. I gather Dr. Smith will go into the chemistry of the test which we are very interested in, but we might be leaping back and forth from witness to witness.

The CHAIRMAN: I would suggest, maybe as a compromise, that we try and concentrate the questions on specific matters dealt with by Mr. Anthony and not wander too widely away from what he has stated. Then we will call on Professor Smith followed by Dean Bowker from Alberta, if that meets with your approval. Is that satisfactory to you, Mr. Aiken.

Mr. AIKEN: I am on another committee that meets at 11 o'clock.

The CHAIRMAN: We have until 11 o'clock and I know we have a lot to be done. We also have the right to sit this afternoon. We have the permission of the House to do so. We can continue on later this afternoon if that is necessary.

Mr. TRUDEAU: I want to say I agree with Mr. Aiken that we will not hear all the witnesses this morning if we start cross-examining each one in turn.

The CHAIRMAN: I am quite sure that is the case. What is the consensus? Would you prefer we call the other witnesses?

An hon. MEMBER: I think we should hear the other witness, Mr. Chairman.

Mr. SCOTT (*Danforth*): Mr. Chairman if we do not get to the questioning is the Committee prepared to sit this afternoon so we can cross-examine the witnesses?

The CHAIRMAN: Is that agreed?

Mr. SCOTT (*Danforth*): I do not care as long as we get a chance to question them.

Some hon. MEMBERS: Agreed.

Dr. WARD SMITH (*Canadian Highway Safety Council*): Thank you very much, Mr. Chairman and gentlemen. I feel that the broad picture of these sections as proposed does credit to the draft of this bill. I feel that it has been long needed in this country. At the present time the reasons outlined by Mr. Anthony show that there is an uneven administration of justice. We have used the breathalyzer test in Ontario since 1965 and, as he has indicated, the refusal rate has steadily increased. There is one point on their use that has not been brought out. Many of these people brought in for testing have not had sufficient alcohol in their system to support the charge that is already laid. The procedure has been to lay a charge, bring the person in and request a breath test. About ten per cent of those people who have provided the test have not had sufficient alcohol in their system to support subsequent action. These have either been sent home, charged with speeding or whatever other thing they were doing.

A few of these, however, have been found to be ill or under the influence of drugs. Those people, where there has been a disparity between their obvious physical condition and the alcohol level, have been taken to a physician for further examination. In many of these cases they have been found to be sick and in a few cases under the influence of drugs. I take it that in this bill we are also dealing with the whole question of the use of drugs by the motorist and some kind of procedure such as this is the way to get at this question of drugs. For this we need something more than breath tests because the drugs do not enter into the breath but can only be detected through samples of usually urine because we need larger samples than can be obtained in an ordinary blood sample.

I have the results here of last year's testing using the breathalyzer in detailed fashion. There were almost 12,000 interviews with 3,000 refusals, which is approximately 27 per cent, leaving 8,500 tests. In 765, which were 9 per cent of the tests, there was no charge because the alcohol level was too low; there were 20 in which there was no charge due to injury or other condition of the driver, and the others were charged under sections 223 and 222. Sixty four hundred were charged under 223 and about 900 under 222 and the others under other charges. This is the summary of a whole set of results from the province in the last year.

This program has been in progress since 1956 and the controls on the procedures used, the training of the officers to conduct these tests, have been very carefully worked out and have been subject to extensive cross-examination over the course of time. Mr. Lucas and I wrote up the general findings about this in a booklet called *Breath Tests for Alcohol* which is reprinted from the *Criminal Law Quarterly* and any of the details of the breath tests, its use and theory can be obtained from that article. I have copies of this here if any of you care to have it.

An hon. MEMBER: It would be most helpful, Mr. Chairman, if it were distributed.

The CHAIRMAN: Yes.

Mr. SMITH: I do not know if I have sufficient copies for all. Also, here is a second article which I presented at the Third International Conference on Alcohol and Road Traffic in London in 1962, which is a publication describing some thing of the controls that we have employed in these tests in Ontario; something by way of suggestions for the operation of the entire breath testing program because I feel that if we are considering this sort of thing then the question of control of the analysis and the persons responsible for it become a very important consideration. No doubt it does not need to be outlined in the law but it certainly becomes regulations for the handling of these affairs in each of the provinces that are charged with the administration of this law. The things have been in the scientific literature, available for people to question and examine, and I assure you that I myself have been cross-examined many times on the basis of these articles in court. However, I have felt it has been a very useful thing to, as it were, lay the cards on the table, so that it provides a basis, in properly done tests, which will be readily recognized by the lawyer.

I feel that this bill provides an answer to a real need in the country for the reasons outlined by Mr. Anthony. In contact with the scientists in the various associations, the National Safety Council and the International Committee on Alcohol and Road Traffic with which I have been associated for the past 16 years, there is general agreement on the facts of the matter with respect to interpretation of the levels which indicate impairment. There is one notable exception to this but he has been fully answered in our courts. The latest most authoritative opinion is that of the special committee of the British Medical Association expressed in their report of 1965. I do not know if you gentlemen have had access to this report but it is very revealing, bearing very closely on the basis for this bill and I have taken the liberty of also bringing a number of copies of it which you might care to review because it summarizes much of the recent scientific studies in the area and applies the experience of a group who in 1954 were not well versed at all in this problem. It shows an interest as a result of much of the research which has been conducted in England where they have accepted other researches that have been done.

The Canadian Medical Association, as you have already heard, the Ontario Medical Association and the American Medical Association all have made statements about the interpretation of chemical tests indicating that at .1 per cent, a driver is impaired regardless of these questions of tolerance.

In the last ten years there has been many scientific studies which support this thesis and it has become apparent that the best way to enforce impaired driving legislation is through the use of these chemical tests. It has been brought out by Mr. Anthony that the traditional evidence that we have been dealing with has been that of the physical behaviour of the motorist. I would like to refer to excerpts from this 1965 report of the British Medical Association. These excerpts may be in conflict with some of the generally held views which have received the widest of publicity in the press because these things are what many people like to hear; but these views are in conflict with this and I would like to, first of all, quote from the conclusions on the question of the relationship between the physical behaviour of the person and the chemical tests. In conclusion (1) they state and they are speaking about the general physical

examination of the person and whether this is conducted by a medical person or by a police officer:

The examination is neither sufficiently sensitive nor reliable enough to detect other than gross impairment of driving ability due to alcohol or other drugs.

In conclusion (2) they go on to say:

We recommend that evidence based on such an examination should not be given to the court for the purpose of determining whether the ability to drive properly was impaired by reason of the suspect having taken alcohol, and that it should be used solely to help the court to decide whether the suspect's behaviour was due to any other factor, such as illness or injury.

Conclusion (4):

We believe that analysis of the concentration of alcohol in the body affords the best available scientific evidence of impairment of the ability to drive properly due to alcohol and we recommend that it be made an offence for a person with a blood alcohol concentration in excess of 80 mg. solidus 100 mi.

which translated into the terms to which we are more accustomed means .08 per cent or .8 parts per thousand—parts per thousand meaning weight of alcohol per unit volume of blood.

Conclusion (5):

We recommend that the courts should have regard primarily to the concentration of alcohol in the body and that they should no longer rely on the results of clinical examination in determining whether or not the ability to drive properly is impaired by reason of the suspect having taken alcohol.

In the same booklet there are a number of other citations which I will not trouble you with now but these are to be found on page 8, conclusions (5) and (9); on page 9, the last paragraph; on page 10 there are three items bearing on this same point; on page 14, at the bottom of the page; page 16, at the top of the page; page 25, the last sentence and page 27 in the long paragraph of explanations at the top of the page.

All of these quotations indicate that the way to deal with this problem is through the chemical tests. It remains then for a discussion of the accuracy of these tests. Dealing with the general problem and the literature up to 1960, this has also been available to the lawyers in an article entitled *Drinking and Driving* which is also presented in the *Criminal Law Quarterly* and this has been available to them for examination and cross-examination for the last three or four years. If anyone would care to look at some of the previous literature and studies bearing on this point up to 1962, I have copies available.

Dealing with the details of the breathalyzer itself, that article has been distributed and in there is indicated the precision of the breathalyzer. Its details have been available for cross-examination since that time. Mr. Lucas is here with me; he has brought a breathalyzer which you see on the end table to his left. If it is requested and desirable this can be demonstrated later on. I have

also had the opportunity of reviewing the available chemical methods for determining alcohol and have prepared a chapter dealing with this topic which has been published in a recent book called "Methods of Forensic Science," volume 4, and this deals with the methods for determining alcohol in the blood, urine, breath and the available methods up to 1965.

● (10.30 a.m.)

This is the sort of background approach I have brought to this problem, attempting to present in the literature for examination the various facets of the problem. We are dealing with many of these tests now in the province of Ontario and have been somewhat hampered by the voluntary provisions of the present law as applied.

There are one or two comments, if I might have the temerity to offer these, on the detail in Bill C-87, as presented. One is that there is unanimity of opinion on the question of .1 per cent as implying or meaning impairment in a driver. This has been determined from actual tests of driving where we have put drivers into motor vehicles and had them drive, and so on. The question of .08 per cent is not quite clear as yet from our scientific studies. One has to appreciate, however, that in our tests and studies we are actually measuring driving performance and one would agree that ability must be impaired to a very marked degree before we can obtain a measure of performance. So I would feel that .08 per cent might well be the level at which impairment of ability is present in all drivers studied but, as yet, our scientific tests uniformly do not indicate this of themselves. They are, in fact, dealing with various aspects of performance. One aspect which we have not been able to test is the attitude of the driver which is probably one of the most important facets of his driving ability and performance.

Secondly, with regard to section 22, sub-section (2), it is intended that this level or whatever is settled upon become conclusive evidence. I think that since we are saying that the person is impaired, then we must deal with the variation that is possible. Our most recent tests do not detect a lower limit which indicates lack of impairment in some susceptible people—that is at the level of .01, .02 per cent at which some very susceptible people have shown to be impaired. When we get to the more resistant people, those who have a high tolerance to alcohol, those who habitually drink one to two bottles of whisky a day, we are able then to show impairment at levels of .1 per cent, and there is a range of human variation. Now, with this kind of variation which has been studied for many drugs, and alcohol is not unusual in this respect, we are stuck with the biological fact that we can only predict variation within certain degrees of certainty. In this field we feel that with a level of .1 per cent there is not any reasonable doubt of a person being impaired at this level or higher, the degree of certainty that is greater than what is ordinarily considered a medical certainty, the degree of certainty that approaches a scientific certainty as high as we could possibly expect when dealing with people. But I do not think that one could say that it was absolute because we are dealing with biological phenomena.

I am a bit disturbed about the "venous blood" reference here. Section 222(2) refers to an alcohol level in venous blood of a person. I think we should realize that when we are using the breath test we are actually dealing with blood that

is going through the lungs and this is essentially arterial blood. Now the difference is this; on page 28 of the same booklet, *The Drinking Driver*, of this report of the Committee of the British Medical Association—and I have seized on this one because it answers so many of the problems that come up in this whole discussion—it says, because the breath reflects arterial blood:

Analysis of the breath is, therefore, preferable to the analysis of venous blood since it estimates the alcohol concentration in the pulmonary circulation which is a more accurate index of the concentration of alcohol in the brain during the period when the concentration is rising.

That is, during the early stage after drinking there is a possibility of a difference in concentration in the alcohol being delivered to the brain as opposed to that coming back from the tissues which is the sample that is obtained in venous blood. At that time the breath tests give a more accurate index of the effect of alcohol on the person than even if you took a sample from the vein. I think we should appreciate that we are dealing with that kind of blood and scientifically, with all due respect for the word "venous" there when referring to blood, it does not make good biochemical or physiological sense.

I am disturbed also about the references here to "a sample of breath". I believe this brings up a point that has been touched on before and that has to do with the precision with which you can conduct any analysis. There is always a margin of variation in analysis and, no doubt, under regulations or whatever methods are used in the various provincial jurisdictions, the people in charge of the programs will allow for the known variation in the methods as employed by the people who are conducting these tests. But the only way that one can get at this question of variation is through a duplicate sampling. Anywhere in chemical work one needs to do at least two analyses, one to verify the other. If there is not verification then there is the possibility there is something here that is not quite controlled in the analysis and this leads the analyst then to search for the reason for variation.

I feel that if we are going to put this much emphasis on an analytical result, then we need to have at least two analyses, one to verify the other and if they do not verify each other within a reasonable limit then the answer should not be presented to a court. We have operated this way in the province of Ontario; we always take two samples and have the opportunity of additional methods of checking on the possibility of variation. For example, if one tries to cheat the machine, that is by pretending to provide a sample of breath, one can lower his apparent alcohol level by as much as 30 per cent. This is done by providing a very short expiration which mainly provides the air from the mouth, upper respiratory passages and really does not provide the air from the depths of the lungs which is fully equated with the blood. For this reason one might get variations in results. If they did not this factor would be in the favour of the accused.

On the other hand, it may well be that under very unusual circumstances indeed a person could have had some very recent large drinks; his alcohol level would be increasing in his system so that the difference between two samples taken half an hour apart may well be substantial. For that person we need to have some way of determining when the alcohol level, which we are speaking about in this law, is applied, are we concerned about it applying anywhere

within two hours of the time of driving or does this level apply at the time of driving. The intent is not clear here. If it applies at the time of driving then we need to have some means of determining that the alcohol level was at least as high at the time of driving as it was at the time of testing, which is always some time later. In the city it might be half an hour later; out in a rural area it might be as much as two hours later. We have used for this purpose urine tests where there is a suspicion that the alcohol level at the time of driving may not have been as high as at the time of testing. Where there has been a long interval between the time of driving and the time of testing or in cases where the driver has not been under continuous observation and there has been the opportunity of taking further drink, we have found the urine test useful. It gives us information on the average blood alcohol concentration prior to the time of taking that urine sample. In this way we have information on whether or not the blood alcohol level could have been lower at the time of driving or whether, in fact, it could not have been lower. So, we need to have this auxiliary information to assist us and it seems to me that the bill is certainly written so as to prohibit this.

Also, we need to have available urine tests under these circumstances to cover the problem of other drugs. I really have no measure of the importance of the driving under the influence of drug problem. I know that as we are focussing on this problem, we are beginning to find these people who are markedly physically impaired, who have very little alcohol, and who are then investigated for the possibility of other drugs, especially as our methods for determining drugs have been improved. They have improved considerably recently. In the last three or four years, with new methodology, part of which Mr. Lucas has been responsible for, we have extended our range of detection of drugs so that we can detect one hundredth of the amount that we could before. But we, nevertheless, need a urine or blood sample in order to deal with driving while under the influence of drug problem.

With respect to section 223(4), it states that the accused shall be offered a sample of the material to be tested to determine the level. We have collected samples of breath in plastic bags and these have been subject to a later analysis. This method has been fairly satisfactory. It is very difficult to get plastic bags. These can be packed in mailing containers of approximately four inches in diameter and nine inches long; it is an awkward parcel. It would be easy to inject air into the bag other than the sample of breath and for many reasons this would not be a good sample to give to someone to take away with them. However, in the last few months Professor Borkenstein, at Indiana University, has developed a method by which the sample of alcohol in the breath can be collected on silica gel. These are the little tubes that are used for this purpose. These, then, can be kept at least up to a month and the sample of breath can then be driven off and measured in the usual way in the breathalyzer. The results of this are extremely accurate. The set of results I have here, obtained by an associate of mine who went down to investigate this last week because it is very new, indicate a very, very small margin of variation between the breath reading done directly in the breathalyzer and the breath reading done by tracking a sample on the silica gel and subsequently measuring it on the breathalyzer. The variation here is within the limits of precision of the instrument itself. So I think this problem is solved and one can, therefore, carry out

the provisions of section 4 without any difficulty once a method of this kind is put into operation, and we fully intend to do it in Ontario anyway.

Those, gentlemen, are the comments that I have about the background for, what I feel to be an excellent bill. I am afraid that scientists are often very picayune about details but I do foresee some of the minor difficulties about which I have spoken in the bill as it is now written. Thank you very much.

The CHAIRMAN: Thank you very much, indeed, Professor Smith. I am going to make the suggestion that the various booklets and so on that you have produced be marked as exhibits 1, 2, 3 and 4 in the order in which they were produced so that later when the Committee are studying the matter they will have these before them. Is that agreed?

Agreed.

Mr. BELL (*Carleton*): Does that include the results of the last test that Mr. Smith just told us about?

Mr. SMITH: I just have one copy but I would be glad to file it.

Mr. BELL (*Carleton*): Would it be possible to have that filed as part of the record?

Mr. SMITH: Yes, certainly.

The CHAIRMAN: Mr. Tolmie you had your hand up indicating you wanted to ask a question. Do you?

Mr. TOLMIE: Thank you; I will when it is my turn.

The CHAIRMAN: We will then call upon Mr. W. F. Bowker, Dean of Law of the University of Alberta, as our next witness.

Mr. W. F. BOWKER (*Dean of Law, University of Alberta*): Mr. Chairman, my remarks will be confined to the issues whether a bill of this kind is in some way or another an infringement of our basic notions of fairness. Usually an objection of this kind is put in terms of either right of privacy, individual rights or dignity of the person and my purpose is to submit that a bill of this kind in no sense violates the British concept of fundamental fairness.

Throughout the administration of the criminal law we must keep a balance between two things. On the one hand, if we have offences in our criminal law we want to be able to impose punishment for them. We want to make the law effective. On the other hand we, under the British system, do not want to do this in ways that are brutal or that savour of the police state. When we think of our concept of fairness we usually refer back to the Magna Carta which was the source of the more modern phrase which says we should not punish people without due process of law. This is a vague term, of course, but it is a useful one and we regard it as one that we should observe.

One cannot enforce criminal law without using compulsion and the power of arrest itself is a pretty stringent power. We try, I think with a fair degree of success, to keep a balance in our law of arrest between the need to enforce the law and the avoiding of abuses. Not only in connection with arrest but in connection with the power to make searches and seizures, the police powers are checked by the need of a search warrant, though in certain cases searches can be made without a warrant; but the power to go into a person's home, car or to

search his person is a stringent one. We accept the fact that this can be done but we do put safeguards around it.

There is one little example, sir, that I do not think is so well known, of a rather wide search power we still have in Canada, and that is the writ of assistance. The writ of assistance is used under the Narcotics Act, under our excise laws and under the Income Tax Act we have something very much like it. It is a very wide search warrant but it is used only for cases where Parliament thinks this stringent power is needed. Mr. Anthony mentioned the power under the Identification of Criminals Act to take a fingerprint which is, of course, a very valuable method of identification; that short act specifically says that if a person refuses to give his fingerprints then the law enforcement authorities may force him to give a fingerprint. If it were not for that section in the act then the conduct of a police officer in seizing a man's hand, forcing it into the ink and forcing it on the paper would be an assault or more technically, a battery, under our law but Parliament has said that it shall be permissible. If it were not so then the whole effect of the Statute would be lost.

● (10.55 a.m.)

I think it is helpful in looking at this subject to make reference to the position in the United States. As we all know, there is a constitutional Bill of Rights in that country and there are several provisions in the Bill of Rights that a person objecting to a compulsory breath test might try to invoke as the basis of an argument that a compulsory breath test is a violation of one or other of the provisions of the Bill of Rights. There are three of them and I would just mention them briefly one by one. The first argument would be that a compulsory requirement of this kind is a violation of due process of law. If I am compelled to take a breath test for the purpose of seeing whether I have committed this offence, I would argue that my liberty is being taken without due process of law. Now, it is interesting to note that this very problem came before the Supreme Court of the United States several years ago in a case called *Breithaupt and Abram*. There a man was driving a car and he was rendered unconscious in the collision. While he was unconscious the police had a doctor very carefully stick a needle in his skin and extract the blood; the same showed a high content of alcohol and this was tendered in evidence. Now, many people thought that the Supreme Court would say this is a violation of due process of law because the Supreme Court had previously held that if the police came along after a man swallowed drugs and they give him an emetic that this is not quite cricket, it is a violation of due process of law and the evidence, namely the drug that was brought up from his stomach, will not be tendered in evidence. But the Supreme Court said we do not see anything in what was done, in the taking of the blood from the unconscious man, that is a denial of due process of law. Now, I only mention that to show that if that was held in the United States then I think we could properly say that it would not be regarded as a violation of due process in this country.

Now, the next possible argument he could make is that compulsory taking of a blood test is a violation of the protection against self incrimination. Now, by our standards anyway, this argument is fallacious. The protection against self incrimination is designed to prevent the state from hauling in people, compelling them to take an oath and compelling them to answer questions. In its proper meaning it does not have anything to do with a physical thing like the

amount of alcohol in one's blood. Now it is quite true that in the United States self incrimination has been given a wider effect, but I would only point out that in this country we do not have any rigid rule against self incrimination because the Evidence Act says that a witness in any criminal trial cannot object to answer a question on the grounds that it will incriminate him; all he can do is to invoke the section of the Evidence Act, then he has to answer but the answer cannot be used against him. So, this so-called protection against self incrimination is not absolute and it does not extend to breath, blood or urine tests anyway.

Now, the third possible argument that the man could use, in terms of United States Bill of Rights, would be that an enactment of this kind is an unreasonable search and seizure. Now, I think you could find American cases that say it is, but in our concept of what is a search and seizure I would say quite confidently that the taking of a breath test or a blood test is not a search or seizure at all.

I would just like to say a word about the British white paper of late last year that proposed an enactment along the general lines of Bill No. C-87. Now the British Parliament is always concerned about unfairness in law enforcement but the government concluded maybe that the problem was so acute that stringent measures were justified and they proposed a bill that works along these lines; the bill was brought in before the election but I do not think it was passed because the election intervened—I am just not sure. But that bill is wider than the one before us in this respect. It permits the police to stop anybody on a stop check basis, just like police can check for drivers' licences in this country, and they could set up a road block and ask anybody to take a breath test. But then the next step under the British proposal is that if the breath test indicates a high percentage of alcohol then the person can be arrested or if he will not go along to the police station, and there he can be made to submit to a blood test or a urine test. This is interesting in the British proposal. The British government did not say that a person must submit to a blood test because it requires this puncturing of the skin that I referred to a moment ago, and the white paper said that to make a person submit to a procedure of this kind whereby a needle was put in his body would rightly be regarded in Britain as repugnant and intolerable. So the white paper proposed as an alternative, if the man does not want to submit to a blood test he must submit to the urine test which does not involve any battery. Now I mention that to show that in Britain with all of its concern about fairness this provision for compulsory tests is proposed in the legislation of which I speak.

The CHAIRMAN: Now, it is 11 o'clock. I do not know if this is a good time to interrupt but we will be back this afternoon. Do you mind if we adjourn very shortly?

Mr. BOWKER: Certainly not, sir.

The CHAIRMAN: If there is something you want to just finish off very briefly, you may do that. But, would you come back this afternoon and start where we are interrupting you now?

Mr. BOWKER: Well, I am in your hands, sir.

The CHAIRMAN: I think we had better adjourn. The members of the other committee are here. You hear it mentioned that parliament is not working as

hard as it should, but I might call to your attention there are 13 committee meetings this morning, and we have to be out of here by 11 o'clock. I am going to suggest that we will be meeting here, in the room that has been arranged for, room 209 at 3.30 p.m. It might be better to fix the hour at four o'clock to allow a little bit of time between the orders of the day and our resumption of the meeting. We will come back at four o'clock. Is that agreeable to everyone?

Some hon. MEMBERS: Agreed.

The CHAIRMAN: I would suggest that we adjourn this meeting then until four o'clock.

Some hon. MEMBERS: Agreed.

The CHAIRMAN: In conclusion, may I thank once again you three very distinguished gentlemen for your contribution to this important subject matter. We will see you all here at four o'clock. Thank you very much.

AFTERNOON SITTING

TUESDAY June 7, 1966.

● (4.06 p.m.)

The CHAIRMAN: Gentlemen, I apologize for being late. The fact is that I am also on the steering committee on divorce and we met at 3.30. I did my best to get away and hurried over here as quickly as I could. Two members of our Committee are still over there and will be here very shortly. If I act like Nelson and announce that this is an adjourned meeting, we will just simply carry on unless there is some objection to that. I apologize to you, Dean Bowker, for keeping you waiting; I would ask you to continue with your statement, if you will.

Mr. W. F. BOWKER (*Dean of Law, University of Alberta*): The delay was no inconvenience to me at all, sir.

Actually, sir, there is very little I have left to say. The main point I wanted to make was that one of the objections we hear to proposed legislation of this kind is that it is unfair to the accused and this complaint is put in many forms, as I said this morning. My main purpose was to show that it is quite reasonable legislation. The degree of compulsion is comparatively mild compared to some others we have, and that even if we were under a constitutional bill of rights, which is much more rigid than our system, it would still not be bad, unconstitutional in terms of self-incrimination or in reasonable searches and seizures, or due process.

When we hear an accused person say: "You cannot do this to me", that is a legitimate stand to take if the police propose to use a rubber hose or the thumbscrew or even more subtle methods to force people to plead guilty or become guilty, but we are dealing with a serious social problem. The accused man always says: "You cannot do this to me", and he always invokes constitutional right and often he calls it a God given right. I am not saying anything original when I say that we are entitled to think of the rights of the victims.

If Parliament passes an enactment of this kind and puts in a provision for a breath test, which is the minimum that is necessary to make it effective I can see no basis for complaining merely because convictions may result.

My last remark, sir, is this, about legislation of this kind. I am not concerned about the details because the bill before us is slightly different from some others that have been recommended. I am not concerned myself in those little differences; others, I know, have spoken to matters like that. It seems to me that public opinion has to be mobilized against the drunken driver. I think legislation of this kind is partly the result of a groundswell; I would think that at least we can hope that an act of this kind would increase the groundswell, and heaven knows we need it. I would not pretend that any legislation will bring about the millenium overnight, but I do believe this that legislation can help to mould public opinion in spite of the old saw that you cannot legislate morality. I think legislation can mould public opinion, and I think people might well be taught that we cannot drink and drive any more. I think legislation of this kind is a worth while experiment, if Mr. Mather does not mind my calling it that, toward ridding ourselves of this evil.

The CHAIRMAN: Thank you very much, Dean Bowker. I have taken it from what you have said that legislation of this type might accentuate the groundswell and, in particular, I think the education will make it acceptable, that is, the theory behind it will make it acceptable to the general public and they would realize the benefit of what was being attempted to be done.

Mr. BOWKER: I agree, sir.

The CHAIRMAN: We are open for questions. Mr. Tolmie you were the first to have raised your hand.

Mr. TOLMIE: My question is directed to Dr. Ward Smith. From my recollection of the various statements in regard to this matter, I understand that certain people react differently, and as far as their actual impairment of ability is concerned it varies to a great extent. In other words, some people might have an alcoholic content of .20 per cent and still not actually show signs of impairment. Other people, and I think it is perhaps those who are introverted, are often helped as far as their ability is concerned at levels up to .08 per cent. My question is this. I understand from your remarks that you do not agree with 222(2) that to be on the safe side, before a conviction would be automatically registered, you would make it .1 per cent. Is that correct, doctor?

Dr. WARD SMITH (*Canadian Highway Safety Council*): Well, my position as a scientist is that having dealt with performance tests, traffic surveys, and contact with others who researched this field, we find it is true that there is a tremendous variation between people in their response to alcohol. This variation is not as wide as one might suspect by watching people drink around the table. There are many factors in the amount of alcohol one needs to consume to get certain alcohol levels in the blood at various times. But even when you have certain alcohol levels in the blood there is still a variation in the response of the individual to that alcohol level; between individuals and in a person on different occasions.

We find that, depending upon the measuring devices, a relationship between those more susceptible to alcohol and those more resistant. The scale of this

is very constant depending upon the sensitivity of the measuring devices. If you are taking mere walking and talking, for example, as your criterion, then the range between people is between .05 per cent and .25 per cent, this is the thing that we measure in our performance tests and the sort of thing a police officer or medical man does when he examines a person. You will find some severely intoxicated at .05 per cent; others not until you get to levels of .25 per cent—the odd individual.

● (4.15 p.m.)

But if you take, on the other hand, the criteria of driving, as was done in the tests here in Ottawa,—the R.C.M.P. tests which I think have been referred to—then you begin to pick up deterioration in driving performance at levels of .03 per cent but not in all people studied until you get up to .1 per cent. Then you have to think for a moment that these tests are really tests of performance where the subjects have made a sort of game of this thing. They have pulled themselves together to do the best job possible, and are these really the conditions that apply on the roads? I think it is for Parliament to decide what levels need be applied here and what philosophy they are going to accept. It is for the scientists to describe the results of experiments and what they mean.

We know, for example, that there is agreement in the levels where you begin to show impairment in driving in performance tests, where you begin to pick up increased hazards in terms of traffic accidents and where you begin to show impairment in many laboratory tests; that level ranges between .03 and .05 per cent. If one were to use that reason alone and not associate it with impairment, one could set a level of that kind as a strict prohibition. If we want to bring in the term “impairment” and here it is written as “impairment of ability” then we have to look to the experiments to see what sorts of ability we are talking about, and the experiments themselves are not really germane on the point because the experiments are measuring performance. Performance is impaired at .1 per cent; the ability would have been impaired at some lower level, possibly .08 per cent. However, the experiments have not yet proven that.

Mr. TOLMIE: Yes, but the point I am trying to make is that from what you have said, at least this is the interpretation I derive from it, .1 per cent there is very, very little doubt that most people have their ability impaired as far as their driving is concerned. Therefore, it would be a more realistic figure to insert in subsection 2 than .08. Is that the case. You would have it compulsory; the test would have to be taken and if it was .1 per cent then automatically he would be convicted of ability impaired. If it was something less, then it would just be a factor to be used among other evidence. This is the point I am trying to establish.

Mr. SMITH: Yes. The level that I present in evidence now in these cases, when I am called, is .1 per cent as meaning impaired.

An hon. MEMBER: How many ounces would that require.

Mr. SMITH: It would depend on the size of the person, of course; if it were an average person, amount the present in the body at the time the tests were taken, say a person of 160 pounds, it is equivalent to the presence of approximately 7 ounces of whisky in the body at the time. This only represents what is

left over after the body has metabolized the alcohol right from the moment the person starts drinking. To this amount you have to add somewhere between an ounce and two ounces for each hour from the time the person starts drinking. You get into a bit of an involved calculation in terms of drinks necessary. The meaning of .1 per cent is certainly more definite than one could expect on just watching people drink. I think it would be useful to have been tested on the breathalyzer, to see something of the workings of this relationship between the amount consumed and the amount remaining in the blood stream. People are consistently amazed at how low the levels actually are after an evening of drinking.

Mr. TOLMIE: In other words, you would not want to see a situation where a man who had a test and it registered .08 would be automatically convicted of ability impaired.

Mr. SMITH: I do not think today that our scientific evidence really supports that position. Scientific evidence today does support the position of .1 per cent, and not of most drivers, but of all drivers studied. It is a much higher level of certainty than most. It is as near a scientific certainty as we can find. It is a much greater certainty than a reasonable medical certainty, for example, because this only indicates preponderance as I understand it from the lawyers. It is just something short of absolute.

Mr. TOLMIE: You would want to make this an irrebuttable presumption.

Mr. SMITH: All I can say is that this is nearly a scientific certainty. It is for the lawyers to translate that into the terms which are acceptable by law.

Mr. AIKEN: I would defer if Mr. Scott has some questions. I know that we rather cut him off when we went ahead this morning but I defer to him if he is ready.

The CHAIRMAN: You had your hand up.

Mr. AIKEN: I am ready to stand in line. Mr. Chairman, I defer to Mr. Scott.

The CHAIRMAN: Do you want to go ahead, Mr. Scott?

Mr. SCOTT (*Danforth*): I have a couple of questions. I would, first, like to ask a couple of Mr. Anthony. We are still in the process of assembling evidence and information and this morning you told us of some of the other jurisdictions where they had brought in mandatory breathalyzer tests or perhaps some other type of chemical test. Is there any evidence you know of in the jurisdictions where these tests have been made mandatory which indicates that the incidence of drinking to accidents has reduced.

Mr. ANTHONY: The problem is, as I understand it, is that the statistics in Canada are not in a position yet where we can accurately record even our present conviction rate or rate of impairment in intoxicated driving. The Dominion Bureau of Statistics has just started, since late 1962, to compile material from information being fed to them through the various police departments on a uniform scale of information regarding charges proceeded with under these sections and records of numbers of convictions obtained. This information has not been compiled for a long enough period of time yet to establish any trend even in the number of offences, let alone at this point to say that there has been any effect upon the trend because we have yet to establish

what the trend is. We have figures now for the last year and the year before last. I do not have them available with me; they show an increase but we cannot go back to 1956 and say that there has been definitely an increase.

In the provinces which I have mentioned, British Columbia's legislation was just introduced this year and will not be assented to until July 1; Alberta's likewise will not be assented to until July 1. Saskatchewan's has been in effect since 1959, I believe. However, the frequency of impaired driving in Saskatchewan has never been to the level where it has been in British Columbia or in other areas. We have attempted to obtain some figures from the Saskatchewan government on this, and I believe we are still waiting for some reply, to show a reduction in the trend. But you cannot say there is a reduction until you find out what the trend is and nobody really has kept statistics up to this point. We have records of convictions and so on but we have not come to the point yet where we can keep meaningful statistics so we can predict the trend and get a reduction. Ontario may have such records; I am not sure. New Brunswick introduced their legislation just last year and the other three provinces who are considering this legislation are Prince Edward Island, Nova Scotia, and possibly the province of Quebec as a result of some recommendations from the Quebec law society which are just as recent as last week. The only province that has had such long standing legislation is Saskatchewan and I have no information from them.

Mr. SCOTT (*Danforth*): Is there anything in the way of statistics from the United States of which you know?

Mr. ANTHONY: Not of which I know. The national safety council has some figures, but I am not sure. Again, it is a matter of reporting and the United States is still trying to set up a plan which will establish a national reporting system, so that you can get meaningful statistics in reductions or increases. This is something, again, which has not been established; it is a matter of financing I think, to spend the money to set up a bureau to compile the necessary information.

Mr. SCOTT (*Danforth*): Did I take it from your statement this morning that you are suggesting an absolute offence be created to operate a motor vehicle with an alcohol concentration in the blood above a prescribed level?

Mr. ANTHONY: The suggestion which I put forth is actually the submission of the Canadian Highway Safety Council to the Department of Justice from resolutions of the council itself. Now, the council, in 1955, adopted the original resolution of the executive committee of the Canadian bar who proposed an absolute arbitrary offence for having a level of blood alcohol exceeding a certain point; also included was a provision still making it an offence to be impaired. In other words, they set two offences out, and this was originally in the first resolution which was submitted in 1965 by the Canadian Highway Safety Council. This was our original submission; that we concurred in the report of the executive committee of the Canadian bar in their suggestion of creating two offences. I did not spell it out here but I merely said that we suggested it was a good idea to set a level at which it would be an offence. Whether or not we would call this offence impaired driving or whether we would just call it an offence, would be something else again.

Mr. SCOTT (*Danforth*): One of the things that worry some of us at times about the compulsory breathalyzer tests is the fear that once it is introduced in court an almost iron curtain goes down over the eyes of the magistrate, and from that point on the accused is, in fact, convicted. This may be an erroneous feeling we have—I have not been able to go through your material—but have you collected any information on the convictions and acquittals where the breathalyzer is introduced and where it is not?

Mr. ANTHONY: Ontario could speak with more information on that and perhaps Dr. Ward Smith might be able to add something to my answer. I will attempt to answer it by saying that we have voluntary breath testing in Edmonton. The city of Edmonton has had a program under way for the last two and a half years. We have not had too many contested cases with the breath testing apparatus; however, we have had one or two which we have lost on the basis of the court not being absolutely satisfied with the way in which the test was carried out.

This is the question, of course, which the courts will look into. As Dr. Ward Smith has outlined in his books that he had distributed to the Committee, there are several things which the court, the defence counsel and the prosecution, must look out for to be sure that the tests are conducted in the fashion as prescribed by those who have tested and approved this apparatus. These are the areas where the defence would naturally examine the crown's evidence on it. Unless the crown can establish that these tests have been performed in accordance with an accepted standard procedure, which is acknowledged as being the proper procedure, then I am sure the crown would fail in its case in so far as the admissibility of the evidence is concerned. The defence counsels have been made aware of these problems by the publications which have been put in the "Criminal Law Quarterly" by Dr. Ward Smith and others. There certainly are defences to it and I do not think it would ever get to a point where it is open and shut because you have a breath test result.

Radar is the only thing I can equate it to, because it is an instrument designed to measure something also. Radar is not above reproach, because the crown must establish, firstly, that the machine was set up; that it was accepted; that it was tested during the period it was in operation and it was re-tested upon conclusion and that all three times it proved to be accurate. They must also be prepared to introduce the graphs showing the speed at which the vehicle was clocked, and they must also show that the machine had been tested within a recent time for accuracy. These are all things that the crown must be prepared to introduce.

Mr. SCOTT (*Danforth*): Your crown counsel in Alberta must be far more thorough than the ones in Ontario.

Mr. ANTHONY: They must be prepared to produce it; whether or not the procedure has done away with the requirement or defence counsel have decided that for their purpose they will accept the machine as accurate is another thing. But the law is clear, that these things must be established in order to prove the accuracy. However, defence counsel have on many, many occasions waived the accuracy of the machine. They have questioned other things such as the identification of the accused or some other matter relating to the defence.

Mr. SCOTT (*Danforth*): One last question and then I am through with Mr. Anthony. In your studies, have you found any information that the severity of the penalty has much to do with the drinking and driving; assuming that conviction is obtained, do you have any general observations to make to the Committee about the severity of the sentence imposed.

Mr. ANTHONY: One reason why I feel we are not getting more convictions for intoxicated driving is that we have a mandatory seven day jail term. The courts—and I am not saying rightly so—are reluctant to put a man in jail for seven days because, as you know, since it is a social offence, a good many people who have respect in the community, apart from their driving, become accused of this offence—some of whom may be doctors, lawyers or leading citizens—and the courts are somewhat reluctant to impose the minimum penalty under the intoxicated driving section and throw them in jail for seven days. Because they are presently included offences the courts may, as their alternative, reduce the charge to the lesser and convict of impaired driving which gives them the discretion of a fine.

● 4.30 p.m.)

In regard to the other half, I imagine the question was, do I feel that the fines were sufficient to reduce reoccurrence of this offence or act as a deterrent. In my experience, and I am speaking of western Canada, as I do not have any knowledge of eastern Canada, generally the fines are not financially high enough to act as a deterrent. A fine of \$150 to \$175 for a first, and sometimes a second offence, is not a sufficient financial lost, if we are thinking of financial loss in the form of punitive and as a deterrent. It certainly is no deterrent when you consider that under many provincial acts there are minimum penalties, such as \$500 for overloading a truck; this is the minimum penalty. The minimum fine for the first offence of selling liquor as a bootlegger is \$300. There is no balance—

Mr. SCOTT (*Danforth*): It has not stopped the bootleggers either.

Mr. ANTHONY: No, but he has a financial gain, too. He figures a profit and loss; whereas an impaired driver does not, this is a straight loss if he is caught. It is difficult to equate the seriousness of the offence and the fine. I am not suggesting that we put in a higher minimum fine in the act, but perhaps the courts might consider increasing the fines; the suspension is, of course, the biggest deterrent to impaired driving. This is the thing upon which most appeal their convictions. It is not so much the fine, but the suspension which follows the fine and the fact that they are going to lose their insurance standing and probably will not be able to get insurance again for some period of time. Many people, of course, claim that a car is much needed in their employment and a six months suspension will create a hardship. I think the greatest deterrent in the impaired and intoxicated driving section is the suspension or the provision for the prohibition, but the fine certainly does not do it.

An hon. MEMBER: My experience does not prove that.

Mr. MATHER: Mr. Chairman, I have one question related to the one asked by Mr. Scott; I wonder if I could just ask it? Mr. Anthony, Mr. Scott asked if you had information or statistics for various provinces in Canada regarding the

results of legislation on impaired driving in respect of mandatory tests. You did not have the figures, as yet, for these provinces and I can understand that. But we had testimony at the last meeting of this Committee from Dr. Troup, who is here today, which stated that Canada is at the very bottom of the countries reporting to the World Health Organization in regard to traffic fatalities. Our record is the worst, statistically, of all the 26 countries reporting. At the very top of those countries, the countries which seem to take the least toll, are the Scandinavian countries which have realistic or mandatory tests for impaired driving. Is this not so?

Mr. ANTHONY: I agree and as I outlined, the problem here is an enforcement technique, because as it presently exists the only time the offender comes to the attention of the police, generally speaking, is (1) as a result of a motor vehicle accident; (2) as a result of erratic driving or (3) as a result of being found in the care and control of a car in an awkward state, such as in a ditch or parked on the side of the road. But we miss all the fellows who are aimlessly going down the highway, on the move, who do not quite come to our attention. We are using rather archaic techniques to detect the offenders because we have to rely on a physical system of observation, to try him and by the time a person gets to the point where physical observation will uncover impairment, as Dr. Ward Smith says, he is probably past that stage where his ability is affected and is now in an advanced stage of impairment. This is probably why we are behind.

Mr. AIKEN: Mr. Chairman, my questions are along the lines of Mr. Scott's, and the other ones as well, and they relate to the question of conclusive evidence that is put in this bill. All the witnesses today indicated general approval of the bill, and I did not hear a reservation about this subclause 2 which provides that a level of .8 parts per thousand or, perhaps, .1 part per thousand, is conclusive evidence. Professor Bowker because he gave us something of the moral issues involved here, and I would like to ask if he has any comment about making such a finding conclusive evidence of impaired ability?

Mr. BOWKER: No, Mr. Chairman, I do not. I said earlier I had not intended to comment on the details of the Bill, although my own thinking had been along these lines, that it would be better to preserve impaired driving as it is, and I would add drunken driving too, although we know of the difficulties in getting convictions.

I would have thought it would be wise to add this as a separate offence. I know this bill does not do that, but that is what the British bill will do, and that means that I am prepared to say that in addition to the offence of impaired driving, and probably drunken driving which depends on the evidence of one kind or another that the faculties have been affected, to make it an automatic offence at a specified level.

Now, if I were asked the question: "What percentage do you say, .08 or .1?" as a layman all I know about it is what I have learned from attending these meetings, and I do not feel that my opinion would have any particular weight. I do lean in this direction, but I think it would be pretty strong medicine today to advocate a bill which would make it an offence to drive after drinking at all, or after one drink; but I do think that something could be said for a competent

legislative body taking the position: We will not let people drive at all. We are a far distance from that in this legislation, but the public would certainly support that for aeroplane pilots or bus drivers or engineers of trains. I would not, personally, feel any more shocked at making it an offence for car drivers. If you put it low, say, .04, there would probably be a fair number of people, if I understand Dr. Smith correctly, whose ability was not affected at all. I personally do not scruple at the legislative power being used to say: "You just will not do it". However, my understanding is that at a level of .1 or even .08 most people are impaired. I hope I have that correctly. I would not share any tears over the odd creep who was able to show to a court that he is just as good as he was. Others may disagree with that, but I appreciate the question and I hope I have been clear in my views about it.

Mr. AIKEN: We, of course, are not limited in any way by the bill, which is purely a guide. I take it that you would then suggest that a separate offence be created which would, in effect, be that any person in care or control of a motor vehicle who has more than, let us say, one part per thousand of alcohol in his blood, would be guilty of an offence.

Mr. BOWKER: Yes, I would, sir.

Mr. AIKEN: With nothing further; the clinical tests having been proven and the fact that he was operating the vehicle having been proven, then you would accept it as a separate offence?

Mr. BOWKER: And leave the other offences as they are. Now, if I may just add this, sir. I have heard this argument raised against the position I have just taken, and this might very well happen. I do not know if this was mentioned before your Committee or not. If we added this new offence, making it an automatic offence with the given level of alcohol in the blood, there is the danger that the other old offences that we have now, might fall into disuse, that they would not be used and we might get a practice where the iron curtain might fall at .08 but would be lifted for everybody below that. That might be unfortunate.

Mr. AIKEN: That leads me to the next question I was going to ask. If we establish a minimum of one part per thousand, do you think that it might have the converse effect of dismissal of charges for people who had only .5 and yet had other clinical symptoms of impairment.

Mr. BOWKER: In theory, it would not, Mr. Chairman, because we still have the impaired offences and I can imagine that a chap who has never had a drink before would be quite addled after a couple of beers and in truth he would be impaired. It did seem to me to be fair to point out, and I think this is what the gentlemen who asked the question had in mind, that in practice the magistrates trying these cases might get an idea life this, Parliament has set this level of .08 or .1, and there might be a reluctance to convict on the other charges. I do not know whether that is so and I would hope it would not be true. I think we have the same thought.

Mr. AIKEN: I have been trying to separate in my mind what the difference would be between the two lesser offences; that is, what is provided in the proposed bill which says that, let us say, one part per thousand shall be conclusive evidence of impaired ability, and the charge which you suggest which is substantially the same thing.

Mr. BOWKER: Without relating it to impairment?

Mr. AIKEN: Well, it is a presumption of impairment.

Mr. BOWKER: According to this bill it is an absolute presumption.

Mr. AIKEN: Yes, but what I am getting at is, would the two offences not be the same thing?

Mr. BOWKER: I would think not, sir, if we concede that some people are impaired at a lower level.

Mr. AIKEN: Perhaps then it would be the difference between proceeding on an indictment and summary conviction; in other words, the impaired driving would be a more serious charge and perhaps carry a more serious penalty?

Mr. BOWKER: I do not know. I would guess that this would be regarded as the more serious offence but I bow to those who have more experience in these things.

Mr. AIKEN: Perhaps, Mr. Anthony would like to answer that.

Mr. ANTHONY: Your suggestion was that if we had the two, there would be an arbitrary level of impairment at, say, a lower point?

Mr. AIKEN: No, I was assuming that it was the same point.

Mr. ANTHONY: No, you would not keep it the same. The question I think, which is properly being considered now is, do we want to go with the present definition of impairment? If so, is this what we are trying to legislate against, impaired drivers, or are we trying to legislate against people whose driving is adversely affected by alcohol, because there is a difference, as Dr. Ward Smith pointed out, in people who are adversely affected by alcohol. The scientists have agreed that somewhere between the level of .03 and .05 almost everybody, to a certain extent, have their abilities and faculties affected by alcohol to such an extent as to adversely affect the operation of a motor vehicle. From that level on up to a higher point the propensity for them to get involved in motor vehicle accidents, or to react to certain given situations, becomes worsened as the level increases. Therefore, we have a low level at which almost everybody becomes adversely affected. Then we have another point 10 at which the scientists will say that everybody is impaired. That is, absolute impairment; no faculties to carry on. It is not that they are adversely affected, but that they cannot drive safely period.

What I gathered from the conversation between yourself and Dean Bowker was that the Dean was suggesting that an offense be created at the lower level. This was basically the suggestion of the Canadian bar, that an offence be created at the lower level—creating an offence to have alcohol in your system of a certain amount, which is a smaller amount than what one would consider for impairment. They, then, left impairment as an offence separate and apart, but did not define what it was. In other words, it was probably an offence of a degree of less impairment greater than the minimum.

Mr. AIKEN: I have just one more question along that line. I do not know who wants to answer it but it is a straight question. Do you believe that such legislation is going to do any real good in connection with the drinking driver problem? In other words, is the mere fact of there being a penalty going to

prevent people from driving while drinking unless it is a serious matter. I am thinking about the minor charge that has been proposed. In other words, is this minor charge going to be sufficiently ridiculous that everybody will ignore it and take their chances on the breathalyzer test and say: "Well, I will only get a \$50 fine anyway", or would it not be better, perhaps, to leave the more serious offence? I would like Dr. Smith to answer that. He professes a purely scientific interest but I know he has had more experience in prosecutions probably than most of us.

Mr. SMITH: It seems to me there is something here that we have not spoken about yet, and there is not that much evidence on it in this country, although there is in other countries. The few studies that have been done indicate that this is a factor, and that is that those who are responsible for much of the drinking and driving are the least compulsive drinkers. When you look at the exceptionally high alcohol levels that some of these people have and are still able to sit erect behind the wheel of a car, and the small degree to which their walking and talking is affected, by definition they have a tremendously high tolerance, this being one of the signs of continued excessive drinking. We are dealing with a pretty hard core group of people. I think it is very important to identify these as early as possible if only to have them look at themselves as others see them, to get some insight into their own problem, and at least to remove them from the road, so that they are not a problem to other drivers.

I do not think that education about driving is going to reach these people; however, education about drinking might. I think this is part of this problem which is beginning to become recognized. For example, we are finding now that on the average the alcohol concentrations in blood and breath tests that we are dealing with, I think, are on the average lower than they were five years ago. I think this is due to enforcement and catching up with some of the more rugged types of drinkers.

Mr. AIKEN: But would a rather minor created offence accomplish this result? Is it your proposal that such an offence would pick them up earlier, perhaps?

Mr. SMITH: As long as he is certain. I think this has had a tremendous effect in altering the drinking and driving habits of the responsible people, and you begin to identify very early in the game the irresponsible people.

Mr. AIKEN: In other words, a person who is three times convicted of driving under a minor offence with a minor amount of alcohol.

Mr. SMITH: I think the penalty for a repeated offence might well take care of the situation.

Mr. AIKEN: May I ask one more question right along the same line? Can any of the witnesses tell us whether the imposition of the impaired driving charge as an alternative to the drunk driving charge did anything along the lines about which we are talking? Has it brought about more convictions for driving after drinking?

Mr. SMITH: I have some evidence on that. The first studies were done in 1950, before the impaired driving legislation came in, a study of traffic accidents in Toronto; and at that time there was nothing between drunk driving and careless driving. There were many careless driving charges where the alcohol

level was high, because we were doing a breath test at that time in the university survey, but there were very few of drunk driving. It seemed at that time that careless driving was covering over for what is now occupied by the impaired driving legislation.

Now most of the charges are impaired driving but there are also a substantial number of driving while intoxicated charges. There has been a better enforcement in the sense that more charges are being laid; a greater attention to this matter is also evidenced by the increasing number of tests over the years. It started off in 1951, and I do not think there were any more than 500 to 600 tests of this kind being done in the province. Last year—we do not do them all in the laboratory—but it is estimated something like 12,000 breath and blood tests were done in the province. With a better tool for enforcement I fully expect we will be doing double that.

Mr. RYAN: Mr. Chairman, I would like to ask Dr. Smith a few questions. First of all, doctor, I believe you said this morning that absolute impairment resulted with almost everyone at .1 per cent per thousand. Is that what we are to understand?

Mr. SMITH: In all drivers studied by our most sensitive tests it had a relationship to driving performance.

Mr. RYAN: But there was still a slight qualification. You at least said at one point that there was absolute impairment with everyone at .1 per cent?

Mr. SMITH: As a scientist within the biological field, I am unwilling to say absolute.

Mr. RYAN: But you are substantially satisfied that, for the most part, it is a blanket.

Mr. SMITH: I think it becomes beyond the level of this phrase that the lawyers use, "beyond a reasonable doubt". It is beyond an almost unreasonable doubt.

Mr. RYAN: Would you be convinced that in 999 out of 1,000 cases there would be absolute impairment?

Mr. SMITH: I would think at least that, based on studies by proper methods which have a relationship to accurate driving performance.

Mr. RYAN: Could you tell the Committee how many ounces of full proof alcohol in arterial lung blood would give .1 parts per thousand. Possibly I missed that this morning.

Mr. SMITH: Well, .1 parts per thousand distributed throughout the body would be the equivalent in a person of approximately 160 pounds, of seven ounces of whiskey in the body at the time the sample was taken.

Mr. RYAN: That would be grain alcohol?

Mr. SMITH: Yes.

Mr. RYAN: What about sugar based alcohol? Would there be any difference?

Mr. SMITH: No; all spirituous liquors in Ontario are diluted to the same horribly low value of 40 per cent by volume. So, 40 per cent of the bottle at which you are looking is alcohol and the rest is water. It is the most expensive kind of water you can buy.

Mr. RYAN: What is the highest proof you can possibly get in a grain alcohol?

Mr. SMITH: In American proof it would be close to 200 proof; American proof is different from ours. With us it is 165 proof, 95 per cent alcohol.

Mr. RYAN: You have told us that a short expiration into the breathalyzer could cheat the machine by 30 per cent. I wonder if the machine can be over excited or cheated in the opposite direction? Take, for instance, a hypothetical case. Say the driver has a flask with him in his car and is sober; he takes one good drink, say, an ounce and a half of full proof grain alcohol; he chokes at the time of taking it, some of it goes down into his lungs; he drives off the road as a result of his choking, and suppose he hits a tree. He is taken to the station not badly hurt, but he is tested within half an hour. Could you get a false result with the breathalyzer from a situation such as that?

• (5.00 p.m.)

Mr. SMITH: No. There are several things bearing on the answer, though: One, that if you rinse your mouth out with an alcoholic beverage, you must wait at least 15 minutes before supplying a sample to the instrument because the mouth is contaminated with the recent drink and you can give a falsely high answer. The rule is that no tests are to be taken until the person has been in your presence for 15 minutes with his mouth empty.

Mr. RYAN: What about alcohol in the lung?

Mr. SMITH: The question of alcohol in the lung, if it was right in the lung this would be so objectionable that the person would be in very bad condition, indeed. But even there the tissues of the lung would tend to—this would be very irritable to the lungs and the person would be very sick indeed. What you are verging on, though, is alcohol in the stomach. There was a theory at one time that with alcohol in the stomach you might have fumes coming up the gullet and throat and so contaminate the sample. This has been proven to be false. The bases for this theory were one or two results in some quite old Scandinavian literature that goes back to 1930. This is really dealing with a situation where very early after drinking there is a disparity, or can be where the amounts consumed are large, between the alcohol concentration in the arterial blood; that is, the blood going through the lungs, and the blood coming back through the veins. It is very difficult to duplicate this because one needs to take extremely large amounts of alcohol in a very short time and do the testing very, very early. These differences exist when you take an actual arterial sample. So whether you take breath or arterial sample, these two agree even during this period.

This work was nicely brought out in the third international conference on alcohol and road traffic and gives tangible evidence that this is the explanation; that it is due to the difference that exists at that time between arterial and venous blood. It is not due to alcohol coming up from the gullet, and so forth. It is also said in this theory that these fumes coming up from the gullet and throat are simply enhanced by taking bicarbonate. This has been tried. We have tested it many times in the laboratories with subjects, and so forth, and we have been unable to obtain any effect in this matter.

There is a possibility, however, that unobserved by the officers who are taking the samples, at the time there is alcohol in the mouth, there could be a regurgitation of actual stomach content then swallowing it which would have the same effect as though you had tasted a diluted alcoholic beverage. This is one of the reasons, this odd chance—I do not know what the chances are but they are very small, indeed,—why I would like to see two samples taken at least 15 minutes apart. Now, the chances of this happening and influencing the results to the same degree on two separate occasions are so remote that you need not consider them. But this is a remote possibility, and one of the reasons, along with the usual chemical reasons, for verifying the result, that I would like to see two samples taken.

An hon. MEMBER: Two samples are taken in Ontario?

Mr. SMITH: Yes, in Ontario it is. But I understand that in other jurisdictions this is not the practice.

Mr. RYAN: To get back to the case of the actual inhaling of the alcohol into the lungs, doctor, am I to take it from what you said that a man would be so sick that you would not be able to test him if he had inhaled some alcohol directly into his lungs?

Mr. SMITH: Yes. There would be so much else wrong with him that you would take him to a physician anyway. A reasonable concentration of alcohol in the lungs is extremely irritating, much more irritating, for example, than taking water down the wrong way.

Mr. RYAN: If you did take a sample of his breath with that condition existing in his lungs, would it throw the breathalyzer out?

Mr. SMITH: Yes, it might well be so high that you would know there was something wrong. I cannot imagine it happening.

Mr. RYAN: If the tests were repeated you would not get the same results from the second test. Would the 15 minute spread be sufficient under those circumstances?

Mr. SMITH: This man is sick; he is coughing, he is gagging; you know the way things happen when you get water down the wrong way. Alcohol's effect on the tissues of the lung would be much more intense; even the dilution of an alcoholic drink, and I think you would get an extremely high effect for a long time, so high that you would know something was wrong.

Mr. RYAN: Could you give us an estimate of how long that period would be?

Mr. SMITH: I have not experimented; I really would not know.

Mr. RYAN: It would be a very rare thing to happen?

Mr. SMITH: I have never had it occur. In the material that we have dealt with over the course of a number of years—we must have dealt now with 60,000 or 70,000 breath tests—and thank you, Mr. Ryan, this is the first time the question has come up. I think the coughing of the person would eliminate the bulk of the liquids, and the remaining liquid would be absorbed by the tissues of the lung, probably at much the same rate that the tissues of the mouth absorb the liquid.

Mr. RYAN: Could I ask another question in another area. How many ounces of alcohol per hour passes through the human bladder; that is, full proof, grain alcohol.

Mr. SMITH: Of the alcohol we take into our system, approximately 90 per cent of it is burned as developed heat energy by the liver; about 5 per cent of any given amount is exhaled through the lungs and the other 5 per cent is excreted through the urine. Excretion in lung and urine is in relation to the concentration in the blood. The average person gets rid of approximately the equivalent of an ounce of whisky per hour, a third of an ounce of pure alcohol per hour. This is not a fixed rate in the sense that it varies considerably from person to person. One of the major factors in this is body temperature; if you are going through a steam bath you can increase this rate to two ounces an hour; if you are chilled and in shock perhaps this rate is only half an ounce an hour.

This factor of different rates of removal between people is one of the biggest factors in being able to drink the other fellow under the table. One fellow can handle two drinks an hour, where the other can only handle one drink an hour.

Mr. RYAN: How long would it take the average person to sober up after drinking .1 part per thousand, or having that level in his blood?

Mr. SMITH: At that level of alcohol, coming from .1 per cent, he loses, again on a good average figure, .015 per cent per hour. It would take him approximately three hours to get down to .05 per cent, and for a person who tolerates that level, .1 per cent fairly well, there would probably be very little residual effects on his ability to drive.

Mr. RYAN: It is common knowledge that a person drinking beer seeks to urinate more frequently than a person drinking hard liquor. I am wondering, when you are asking that we consider urinalysis as well as breathalyzer tests, one being supplementary to the other, do you have mandatory tests in mind or voluntary tests in mind?

Mr. SMITH: No. I would think that, of course, because of the delicacy of the situation, especially where females are involved, the only mandatory provision should apply to breath tests, but once you are satisfied on the breath test itself, all that the urine tests can do for that driver is to be an exculpatory thing. If in fact his alcohol level was rising and he did not have that alcohol level at the time he was driving, but did have it subsequently at the time of testing and where that was suspected, you would want to leave it open so that the proper investigation could be made which might be well in the interest of the accused.

And secondly, at another stage of the investigation, should the alcohol content prove negative, or of very low value and a person showing very marked impairment, the investigating officer would then take him to a physician for examination to see whether there were not some of these other medical conditions affecting this person. This happens many times. The physician, having made his examination and not having found anything, we might well then turn our thoughts to the question of drugs. We would then want to be able to obtain a urine sample, and in the odd case, a blood sample. But I feel that this would have to be on a voluntary basis or probably on a voluntary basis.

Mr. RYAN: Can you see a large field for abuse of this voluntary testing suggestion in the policing area? What I am getting at is, are we going to have suspects held a great number of hours longer than they otherwise would be for the purpose of putting them through a good number of tests? Are we going to have their urine taken whether they have expressly approved of it or not? Are they going to be held until such time as they do urinate? Is this supplementary evidence going to be used? What dangers are there in this area? Maybe Mr. Anthony might be helpful.

Mr. SMITH: This is what is happening now. All of this is on a voluntary basis, and our instructions to the officers are, in the course that we put on for them, to try to obtain a breath sample if you can. Where there is quite a length of time between the time of driving and the time of arrest, by all means attempt to get a urine sample, because this will then throw light on whether his alcohol level is falling or increasing. If the alcohol level that you do obtain is lower than you expect by reason of the behaviour of the person, then you must take him to a physician because the guy might be sick. Now, all this is in the interest of the accused driver. I am quite sure it is not being abused.

Mr. RYAN: I think that is all I have to ask.

The CHAIRMAN: Does anybody else have any questions?

Mr. SCOTT (*Danforth*): Mr. Smith, I was not aware, until you mentioned it, that two samples are not taken in other jurisdictions. Would it be your view that a single breathalyzer test is not sufficiently reliable?

Mr. SMITH: We have had no difficulty with single tests. It is against my very principles of analysis. The only way you can get at variations in such things as reading the dial adjusting the knobs and so forth is through the variation you get on repetitive performance. It is a check on all aspects of things. When we do blood tests in the laboratory even though we just have the one sample of blood, we do the analyses in duplicate or triplicate and this is in laboratories where you have professional scientists doing analyses. I do not feel that you should do anything less with breath tests in the field done by what are essentially trained technicians.

Mr. SCOTT (*Danforth*): Would you not agree that you are going to make that a presumptive case. It should be all the more necessary.

Mr. SMITH: Yes, I do. I have been very concerned with this whole question of standards of analysis. It is a very verdant complaint. I am as unpopular as a skunk at a garden party down at the national safety council, for example, because, again, in my capacity there I have repeatedly spoken out for two tests and very few down through the states do this. I feel it is the only way to be really sure and open up this whole question of variation in a proper manner. The usual police response of course is, well, what do we do if the tests are different? Well, you present them both so the court can have the full information on which to base its finding.

Mr. SCOTT: At noon hour I was interested in trying to glance through this very excellent material you gave us. I gather from your information that it is important that these officers be carefully trained to administer the tests. Have you any information on how these regulations are laid down? For example, I presume it is a provincial matter in each case?

Mr. SMITH: I think you have to appreciate that this whole program sort of grew up like Topsy. As scientists we set out certain standards, without having any direction in the matter at all, standards which we felt would develop the right type of attitude, which would develop an air of proper investigation on the part of the officer, and would assure us in the actual conduct of each analysis that the results were, in fact, correct, knowing full well that when questions of opinion were going to be required, we would have to go to court to review what he had done and to decide whether or not we were in a position to support that analysis or not, and often in the face of a rather rigorous cross-examination devised in the odd few cases by opposing experts. The program was designed to withstand this kind of attack and there has been no instruction on the matter. This has seemed to stand up very well across the years in Ontario and has been adopted in a few other jurisdictions.

Mr. SCOTT: I do not want to go into the Rabinowich objections today because I gather we may have him here and hear his own statements. But there was one article that came to my attention and I wonder if I might ask you just a couple of questions concerning it. Criticism in this treatise is that the breathalyzer does not, in fact, measure alcohol specifically at all.

Mr. SMITH: Yes. If one takes any one of several hundred organic chemicals and drops them into the ampoule the ampoule will, in fact, change colour; it reacts with these things. But when you get down to the kind of things that can be present in the breath of a living person, then you are restricted to ethyl alcohol, grain alcohol, wood alcohol or ether. Such things as paraldehyde which may yield small amounts of a substance which reacts do this owing to the extent of .01 per cent for a dose which would be as intoxicating as, say, .4 per cent alcohol. The material which is present on the breath of the diabetic in the acetone will not react under conditions used in the ampoule. There is another substance, acetaldehyde, which is produced when a person taking antabuse also takes a little alcohol; this produces such a small quantity that it would not be measurable on the instrument. Three things are involved: Methyl alcohol and ether can react as alcohol does. They are differentiated from alcohol because when the reading is taken, the sample is bubbled through the tube and you wait approximately 90 seconds and take a reading. You take another reading a minute later with that same tube without doing anything with it, you will get the same reading with ethyl alcohol but with methyl alcohol and ether you get remarkably increased reading. In this way those two substances can be differentiated.

Mr. SCOTT: I am told, for example, and you mention it in your book, that you cannot actually smell alcohol on a person's breath. What you smell are the by-products in the mouth as the result of the use of alcohol.

Mr. SMITH: That is right. It is interesting to try this by drinking pure laboratory alcohol, dilute it, of course, to this concentration, as I have done.

Mr. SCOTT: In studying this matter, I must confess it gets one away out of one's depth, that is why we are glad to have you here; but it is suggested that there is no known test that can identify ethyl alcohol as a chemical in the breath. Would you disagree with that?

Mr. SMITH: I would. I think I have outlined the circumstances by which the inference is so strong that this is ethyl alcohol, that we did not have to consider any other substance. Again, you see I am avoiding an absolute.

Mr. SCOTT: You are not saying that you assume it is ethyl alcohol because you do not know what else it is?

Mr. SMITH: No, on the contrary. We have tested everything else; it is the only thing that does react in this way.

Mr. SCOTT: That is all I wanted to ask, Mr. Chairman. Thank you.

I was going to ask you, so much material has come in today for us to read over is it possible that we might be able to call on these witnesses again?

Mr. SMITH: I would be very pleased to come back at any time. I feel that it is a very important matter to all of us, and should there be evidence given contrary to that presented today, and any lingering questions which you may want to have brought up by way of rebuttal, I would appreciate coming again.

Mr. TOLMIE: You touched upon this a little while ago. Section 222(2) states "in venous blood of a person as conclusive". Now to be absolutely accurate and safe, would the sample not have to be taken from the blood, based on the fact there is evidence to the effect that breath and blood readings are not always identical? This would presuppose that these would be identical in order for this section to be valid, would it not?

Mr. SMITH: I would think that in section 2 this could be generalized by saying whatever level in blood, and then this leaves it open to translate the breath test into terms of blood, or collateral use of the urine test into blood or blood itself. We are not getting at venous blood when we are using breath tests. The blood that really matters is that which is going to the brain carrying the alcohol with it, the person's behaving toward alcohol, that relationship, the arterial blood matters.

Mr. TOLMIE: So the word "venous" perhaps could be taken out or some other substitution made?

Mr. SMITH: I think it could be deleted. It does not make good technical sense to leave it there when you are speaking about blood tests.

Mr. TOLMIE: I have just one final question and this is, perhaps, a general question, directed to whoever would like to answer it. I realize that the whole purpose of the breathalyzer test is to register convictions; perhaps make it easier for the police to convict a person basically; it is a scientific means of evidence. Is the philosophy behind this that the certainty of a conviction will deter people from drinking. In other words, people who will be going to parties and drinking, will they think in their own minds now that there is a certainty of being convicted because of the breathalyzer test, and I will desist from drinking. Is this the purpose of it?

Mr. SMITH: I would think so.

Mr. TOLMIE: How effective do you think this will be?

Mr. ANTHONY: When there is no means now to detect the presence and you are introducing a means which is assuring the detection of the presence, it will be 100 per cent effective as far as the individuals are concerned because now, as

most of us know, we say, those of us who may drink and drive after a party where there is usually a few drinks, "we personally feel that we are all right to drive". Secondly, most people feel that they do not stand much of a chance of being stopped in any event. If they were they could assure the officer that they were not in an impaired state. But the fact that there is a machine that will measure with certainty the degree of impairment, there is not much chance of fooling anybody whether or not they were impaired or affected as some people who have a high tolerance have got away a great many times by the fact that they could put on a pretty good show when stopped. There are many cases where we have not prosecuted because the physical evidence available is not there to support the charge in the courts. Yet we are sure, almost positive, that the man was in fact impaired, particularly in cases where a man has been prone to motor vehicle accidents. I cannot overstress this because if the man is involved in a motor vehicle accident and even if he did not sustain any serious injuries, a pathological defence is available to him which almost precludes conviction period, because the possibility of any sort of concussion or shock might produce symptoms to impairment or intoxication. The only way you can show that the symptoms he displayed at the time of the accident were not those of shock or concussion would be by introducing evidence of actual blood alcohol concentration at the time, which would preclude this rather large scapegoat which is being used at present by departments, particularly on the part of the people with whom we are concerned. The ones who have been involved in the accidents, who are involved in the fatalities or the injuries, because once they are involved in a physical collision the courts are most reluctant to convict on physical evidence alone, because there are so many contributing factors which come into effect and play here, once the body has been in such an accident—

● (5.30 p.m.)

Mr. TOLMIE: I realize there is a greater certainty of conviction. The point I suppose you are trying to make is that would it deter me, for example or you, or the ordinary person because they feel that there is a greater certainty of conviction because of the added value of the breathalyzer test?

Mr. ANTHONY: I think it would be sheer speculation the same way as when we were discussing here whether or not an increase in punishment is going to further deter people from driving. If you increase the minimum penalties or make punishment greater, is this going to deter. It is common sense speculation that it will, but it certainly is only guesswork at this point because we do not know. I think the results in Sweden and in the European countries has shown that it will.

Mr. TOLMIE: That is the point I just wanted to make. Do you have available any statistical evidence to show that there has been improvement since the breathalyzer tests have been introduced.

Mr. ANTHONY: In those countries?

Mr. TOLMIE: Yes, in those countries.

Mr. ANTHONY: Where it has been used for a while, yes, because in Canada, although we have legislation in five provinces, only one province has used it for a period of time, and the frequency with which they have used this legislation is

a little uncertain at present. I am not sure as we have no figures on that. All the other provinces are starting but none of them has used it for any period of time, so we cannot say what it would be in Canada or what effect it would have.

Mr. TOLMIE: No, but it would be helpful if we could get evidence of what happened in other countries.

Mr. RYAN: Mr. Chairman, I have a related question.

Mr. SMITH: May I add something to this one? I think, too, we are forgetting about the fellow who has actually had the one or two drinks and needs some means of proving this or the fellow who is, in fact, sick. These come up frequently enough and this is the orientation of our law that 100 guilty people get off than one innocent person be convicted. These people amount to five per cent of those who are picked up and examined and tested. I think these are a very important group with which we should deal.

Mr. RYAN: May I ask a question? A man is driving an old car with muffler trouble and there is carbon monoxide coming into the car. Can it give these symptoms that you have described?

Mr. SMITH: It can give the symptoms but the tests would be negative.

Mr. RYAN: Thank you.

Mr. MATHER: Mr. Chairman, just on the point raised a minute ago about what we could presume to be the effect on drinking drivers if we passed this sort of mandatory legislation. I think it might be useful to remember that earlier today we had testimony, you will recall, to the effect that in Ontario something like 25 or 30 per cent of people involved in accidents and suspected of being impaired declined to take the breathalyzer test because it is on a voluntary basis. Of that 30 per cent who declined to take the test a high percentage apparently are the hard core drinking drivers who are experienced enough to know that they do not have to take the test. I think it is pretty obvious that if they know they have to take the test, it would surely have a beneficial effect on sobering up that type of driver.

Mr. BOWKER: The remark I was going to make was in keeping with the ones made recently and the earlier one on the question of whether an offence such as we are talking about should be regarded as a minor one or not. They are all tied in. I would express this opinion. I think the bulk of the people are law abiding; I think there are a great many people, I would not attempt to guess the percentage, who observe the speed limit because it is the speed limit; but it only takes a small fraction who do not take that view to do a great deal of damage, and for many people, the mere creation of the crime with a small sanction might serve the purpose. However, we are as concerned about the other ones as well; they are the hard core. Speaking for myself, I would not think an offence such as we are talking about now, whether it is related to impaired driving, as it is in this bill, or whether it is a completely separate offence, as we were talking about a little while ago, should be regarded as a minor offence at all. I would think it should be regarded as something that Parliament has shown it takes seriously so that there would be a real motive for people who are not prepared to obey the law just because it is there would think twice before they violate it.

Although I cannot speak for the sponsor of the bill, I would think in looking at these proposed penalties that the sponsor does not regard it as a minor offence either; I think I would not, anyway.

Mr. SCOTT (*Danforth*): I have one last question. It is not really important. You have expanded your face a little bit; you wanted a general offence of driving at some prescribed level and then mandatory breathalyzer tests in all cases. You are suggesting that the officer would have complete discretion to decide upon the admission of the test?

Mr. BOWKER: On the admission of the test?

Mr. SCOTT (*Danforth*): Or the giving of the test.

Mr. BOWKER: And whether he would take the test or not?

Mr. SCOTT (*Danforth*): No. The officer merely makes a judgment that he thinks the person may have been drinking and then they are required to take a test.

Mr. ANTHONY: Yes; on reasonable and probable grounds to believe the man is influenced by alcohol and then he would request the test.

Mr. AIKEN: May I ask a supplementary that I have been wondering about, too. What, in practical terms, would such an offence do to the policeman who decides that this person or that person may be impaired or may have been drinking. I am wondering if this may open up a complete new field where the police may stop any vehicle at any time and demand that the driver take a test. Would we not have to require that policeman have some reason to believe that an offence has been committed. This has been bothering me all day, and I could not put it into words, but if we do create such an offence and there are no outward symptoms and presumably there will not be in a lot of these cases, it is going to result in the police stopping at random people in the same manner as they stop them and ask them for their registration.

Mr. ANTHONY: I do not think you can legislate in the area of application of it so much but you have to leave a great deal to those who have been entrusted with the enforcement of your laws to see that they are enforced as you designed them. If there are encroachments the courts are usually the first ones to bring it to the attention of those responsible for the administration of justice in the province, namely the attorney general's department, but, I must point out, that the provisions now in the Criminal Code do not preclude the police officer from stopping every car on Wellington right now and checking the driver for impairment, even on the pretense of stopping them for a check on licenses, but at the same time, of course, he is also observing him for the other.

They do not do it because, firstly, there are not enough police officers available in this country to stop all the cars. If it was so, then we would have an answer to the suggestion so often put forth, why do the police not stand in front of the beer parlours at 11 o'clock and test these drivers when they come out, because everybody knows; you see them coming out and getting in their cars, why not get them there! I would hate to think of how many beer parlours there are in Toronto but I am sure there are not enough policemen to cover even the parking lots let alone each person who walks out under the influence. The chance of this type of application of the law is very slight because of our limited enforcement.

Mr. AIKEN: But I presume also that policemen who did such a thing without any reasonable cause might find themselves in civil difficulties.

Mr. ANTHONY: Yes, and the people, no doubt, if they were stopped without cause, and they might very well because of some suspicious manner in which they operated their car; for example, people sometimes drive very slowly at night; and at 2 a.m. in the morning, the police could suspect that he is probably winding his way home after a party; he will stop him and ask him where he is going, and if everything is fine, he goes on. But sometimes this in itself brings about complaints from citizens who feel they have been stopped unjustly, and perhaps they feel they have been accused of something; but they have every right to complain and they certainly do complain and these matters are dealt with by either the Attorney General's Department or the department responsible for the police officer's conduct.

Mr. AIKEN: Thank you. It was a point I wanted to have clear and I think there is a reasonable answer to it.

Mr. RYAN: I would like to ask Mr. Anthony if he thinks it is feasible to put a time limit on the length of time a suspect could be held after being picked up on reasonable and probable grounds and tested twice, say.

Mr. ANTHONY: If a charge is not being laid he has to be released right away. If you are thinking of a time limitation between the time he is brought in and tested on an impaired driving section, of course, he would in all probability be arrested on the offence itself, just on the fact that he had certain appearances of impairment. However, if we get to a lesser level of blood alcohol where the person may not show those physical symptoms, this is a different problem.

Mr. RYAN: From the point of time when he could be let out on bail, I suppose.

Mr. ANTHONY: Yes, and there would also be a point between this Committee and the Department of Justice as to how that section would be worded to give the police officer the authority to hold a man for testing, because this type of test that we are talking about here is not a field test which can be done on the spot without inconvenience.

Mr. RYAN: I am predicating it on the dual test—

Mr. ANTHONY: Yes. Two tests, fifteen minutes apart and also you have to take the man from the scene where he was first checked to the place where the test is being conducted. If the man says, "I am not going", the only authority you have presently to take the man is to arrest him. That is the pretence but if we are going to enforce a lesser level and the grounds for suspecting the man may not be so strong for the police officer to execute what he might consider an on the spot arrest.

Mr. RYAN: Could you make a reasonable length of time suggestion to the Committee?

Mr. ANTHONY: Dr. Ward Smith would know more about that. I think in the city of Toronto, traffic being what it is, it would probably be a three hour period I would say from some of the spots in rush hour Toronto to a place where he might be tested and given time to have his two tests, or even more.

Mr. RYAN: Are these tests not all done within an hour to an hour and a half in Toronto?

Mr. SMITH: Outside Toronto it may be different, depending upon—

Mr. RYAN: Is there an outside time limit that you could recommend, Dr. Smith?

Mr. SMITH: Three to four hours.

Mr. ANTHONY: Might I interject. In Saskatchewan the legislation says the person shall get a test. Now, it presumes the fact that the test shall be given and it is up to that person to comply with the law by going voluntarily to the station—he is not under arrest—to submit to a test. They try to make the time involved as short as possible; he is not under arrest. If once tested at the station and the officer is satisfied that he does not fall within the category of what a person might presently be considered to be impaired, he is not released because he was never in custody. He went voluntarily and he leaves voluntarily. That is the way they have set it up to avoid the problem of trying to set it out so that a policeman has to arrest him. The law says a person shall submit to a test and, of course, they know that the test can only be performed in the police stations or in the building where the lab is. So the person is required by law to go to have the test regardless of where it might be. He is not arrested; it is a requirement of law. Failure to do that—

Mr. RYAN: In effect, it is a kind of arrest, though.

Mr. ANTHONY: No, because if he does not go and as pointed out in your bill, failure to do that means that he has committed an offence.

Mr. AIKEN: And arrest him for that.

Mr. ANTHONY: They might arrest him for failing to do it, but there is no arrest in essence because the requirement is that he must give a test without spelling out where the test might be. He must give a test and he would, I assume, receive instructions from the police officer as to where the test would be performed. I imagine eventually when the technicalities are worked out you might have to say: "You will give a test without delay", because some people might come in tomorrow and be tested.

Mr. SMITH: It is a rather self-limiting thing because all the time that this is going on the man is removing alcohol and the longer the elapsed time, the less alcohol level there is going to be found in the subsequent test.

Mr. RYAN: Yes, but doctor, would your evidence not be retroactive? In effect, you could say the average person passes so much per hour through the breath, the urine and so on and, therefore, he must have had so much at the time of the accident?

Mr. SMITH: When you try to become retroactive about it, then you do get into real difficulties and probably today 50 per cent of the cross-examinations are on this question of retroactivity.

Mr. RYAN: Reconstruction is difficult?

Mr. SMITH: You have to adopt or infer or suggest the rates of removal which are minimal rather than average or maximal. It is always in favour of the accused.

Mr. McQUAID: That suggestion of yours, doctor, though that it works for the benefit of the accused is the thing that is bothering me. Suppose this man has had his last drink—that is his seventh drink, the one required to put him up to 10—just four or five minutes before the accident. Now, the alcohol in that drink did not contribute to the accident. You take him to the police station, a period of an hour or so has elapsed, this is enough for the extra drink to go down into his system and show on your test—

Mr. SMITH: That is why I want the urine test because then I can detect that situation. The urine test is a collateral piece of information.

Mr. SCOTT: Do you think for the breathalyzer to be accurate there should be a compulsory urine test along with it?

Mr. SMITH: In this situation, where there is this possibility, I would like to see the officer being able to ask for additional information to cover such a point because in any testing situation it is always some time after the actual driving. There is the problem in your mind always of adapting the calculation to the time of driving. Without that urine test we really do not have any factual basis for it. We can go on the behaviour of the person during this time interval; if he is getting better during this time interval it is inferred that he is getting rid of his alcohol and sobering up. But there may be other reasons for it. He may be recovering from the shock of the accident or the arrest and so forth. You really do not have definite evidence as to what his alcohol level was at the time of driving and you need, in many instances, to have some collateral information on that. This is the way we use the urine test.

Mr. MATHER: It is available now, is it not, on a voluntary basis?

Mr. SMITH: It is available now on a voluntary basis. I might point out, however, one thing. We are dealing now only with the area where the person is on the borderline 10. For the most part, my experience has been that many of them are in the 15, 16 range and the hour and half interval has had very little effect on that because an hour and a half would give them only a certain increase which would still put them well above .10 even if they had consumed the last drink just two minutes before the accident.

Mr. ANTHONY: It has been very interesting how many of them, when they get to court, have very bizarre drinking patterns; they have consumed ten ounces of whisky just ten minutes before the accident. This was not really in their system at the time of the accident but it is there at the time of testing and I have gone through many interesting cases with the person that you refer to where this has been the defence.

Mr. MATHER: Maybe we need a saliva test?

Mr. FOREST: Maybe this question was asked but I regretfully came in late. If this became law, doctor, could the person carry some kind of a pill that would neutralize the effect of the alcohol before he takes the breathalyzer test?

Mr. SMITH: Unfortunately not. Chlorophyll, for example, will get rid of the smell of the alcoholic beverage but will not affect the alcohol content in his system. We have not yet found such a pill.

The CHAIRMAN: Are there any more questions? Then I would like to take the opportunity of thanking our very distinguished witnesses for being with us

today and for the wealth of information with which they have supplied us. We have had it from the scientific point of view; we have had it from the civil rights point of view and we have had it from the legal enforcement point of view. I think it is a wonderful contribution to the efforts of this Committee and on behalf of the Committee I would like to thank you all, Mr. Anthony, Dr. Ward Smith and Dean Bowker.

OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE

This edition contains the English deliberations
and/or a translation into English of the French.

Copies and complete sets are available to the
public by subscription to the Queen's Printer.
Cost varies according to Committees.

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS
First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE
ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE
No. 9

THURSDAY, JULY 7, 1966

Respecting the subject-matter of

- Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles)
Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles)
Bill C-87, An Act to amend the Criminal Code (Impaired Driving).
Bill C-105, An Act to amend the Criminal Code (Insanity)
Bill C-118, An Act to amend the Criminal Code (Negligence in operation of motor vehicles)
Bill C-176, An Act to amend the Criminal Code (Insanity at time of trial)
Private Members' Notices of Motions Numbers 26, 31 and 38

WITNESSES:

Mr. John Munro, M.P. Sponsor of Bill C-176; *From the Ontario Department of Health*: Mr. B. Swadron, Director, Study Project on Mental Health Legislation; Dr. B. Boyd, Superintendent, Ontario Mental Hospital at Penetanguishene.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS
Chairman: Mr. A. J. P. Cameron (*High Park*)
Vice-Chairman: Mr. Yves Forest
and

Mr. Aiken,	Mr. Honey,	Mr. Otto,
Mr. Bell (<i>Carleton</i>)	Mr. Laflamme,	Mr. Ryan,
Mr. Choquette,	Mr. Latulippe,	Mr. Scott (<i>Danforth</i>),
Mr. Chrétien,	Mr. MacEwan,	Mr. Tolmie,
Mr. Fulton,	Mr. Mather,	Mr. Trudeau,
Mr. Goyer,	Mr. McQuaid,	Mr. Wahn,
Mr. Grafftey,	Mr. Nielsen,	Mr. Wolliams—24.
Mr. Guay,		

(Quorum 10)

Replaced Mr. Asselin (*Charlevoix*), Thursday, June 16, 1966.

CORRIGENDUM (English copy only)

MINUTES OF PROCEEDINGS AND EVIDENCE No. 8—Tuesday, June 7, 1966

In the evidence—page 178, line 10, should read:

“... 1956 ...” rather than “... 1965 ...”

Timothy D. Ray,
Clerk of the Committee.

ORDERS OF REFERENCE

WEDNESDAY, June 15, 1966.

Ordered,—That the subject-matter of Bill C-105, An Act to amend the Criminal Code (Insanity), be referred to the Standing Committee on Justice and Legal Affairs.

THURSDAY, June 16, 1966.

Ordered,—That the name of Mr. Grafftey be substituted for that of Mr. Asselin (*Charlevoix*) on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House.

MINUTES OF PROCEEDINGS

TUESDAY, July 5, 1966.

The Standing Committee on Justice and Legal Affairs having been duly called to meet at 9.30 A.M. THIS DAY, the following members were present: Messrs. Cameron (*High Park*), Forest, Grafftey and Mather (4).

Also in attendance: Mr. John Munro, M.P., Sponsor of Bill C-176.

At 10.00 a.m., there being no quorum, the Chairman, Mr. Cameron, postponed the meeting until Thursday, July 7, 1966, at 9.30 a.m., or to the call of the Chair.

THURSDAY, July 7, 1966.

(11)

The Standing Committee on Justice and Legal Affairs met this day at 9.50 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Aiken, Cameron (*High Park*), Choquette, Guay, Honey, Laflamme, Mather, Ryan, Scott (*Danforth*), Trudeau (10).

Also present: Mr. Baldwin, M.P.

In attendance: Mr. John Munro, M.P., Sponsor of Bill C-176; Mr. B. Swadron, Director, Study Project on Mental Health Legislation, Ontario Department of Health; Dr. B. Boyd, Superintendent, Ontario Mental Hospital at Penetanguishene.

The Chairman introduced Mr. Munro who introduced Mr. Swadron, and Dr. Boyd.

Following a statement by Mr. Munro explaining Bill C-176, of which he was the Sponsor, he was questioned by the Committee.

Mr. Swadron made a statement, during which he read into the evidence a letter from the Honourable A. A. Wishart, Attorney-General of Ontario to Mr. John Munro, M.P., commenting on Bill C-176. Mr. Swadron distributed to the Committee an outline of his presentation.

Following the Committees questioning of Mr. Swadron, Dr. Boyd was invited to make a statement.

The Chairman, Mr. Cameron, was called away to another meeting and Mr. Reid Scott (*Danforth*) was invited to assume the Chair as Acting Chairman.

At the completion of the questioning of the witnesses, the Acting Chairman thanked Mr. Munro for his presentation, and Mr. Swadron and Dr. Boyd for their valuable contribution.

Moved by Mr. Ryan, seconded by Mr. Aiken,

Resolved,—That reasonable living and travelling expenses, in accordance with the scale of expenses approved by Mr. Speaker, be paid to Mr. W. F. Bowker, who appeared before this Committee, June 7, 1966.

At 11.55 a.m., the Acting Chairman adjourned the meeting to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

THURSDAY, July 7, 1966.

The CHAIRMAN: Would you please come to order. We have, besides yourself, Mr. Munro, two other important witnesses.

Mr. MUNRO: Mr. Chairman and members, I am going to be very brief. I have with me Mr. Barry Swadron, a lawyer presently with the Ontario Department of Health in charge of their mental research division, and a noted author on the law pertaining to insanity. He is here today to give further background into the merits of this bill and also to give evidence as to certain refinements and improvements that could be made in this bill.

Along with Mr. Swadron is Dr. Boyd, who is Superintendent of the Ontario Hospital at Penetanguishene, Ontario, in which hospital there is a maximum security unit; this hospital is also for the criminally insane. Dr. Boyd is a graduate of the University of Toronto, 1945. Prior to taking the post as superintendent of the Ontario Hospital at Penetanguishene he was at Sunnybrook Hospital, the Ontario Hospital at St. Thomas and the Ontario Hospital at Hamilton. He is a Fellow of the American Psychiatric Association; he is a certified psychiatrist and he is the author of many articles on forensic psychiatry.

Both gentlemen have taken a very active interest—it is part of their lives, really—in legislation of this kind and they have been good enough to come down and give the Committee their views as to the necessity for changing the law in this respect. I think their evidence and testimony would be far more helpful than anything I could say, other than to refer members of the Committee to the background brief on the Farewell case, which was one case, really, that brought home to me that some change was necessary. In that particular case the accused was a mentally retarded boy who was charged with rape and, of course, under the present law the question of fitness to stand trial was the preliminary issue to be determined. It was determined that he was not fit to stand trial; he was incarcerated and evidence could not be adduced, therefore, that might point to the boy's innocence. There was evidence of a fairly convincing nature, body emissions, blood tests and so on that could point to the essence of the case that he was not, in fact, involved in the particular crime.

There are many other examples where there could be considerable improvement in the law in this respect. In the submission it sets out and makes reference to the Farewell case; it also points out the amendments that were made in England with respect to this matter, which allowed the judge to postpone the issue of fitness to stand trial, allowed the Crown to put in its case to establish whether it was a fact that they had a *prima facie* case. The suggestions in this bill, for which you will hear refinements, goes a little further and granted the judge the option, if you like, of calling witnesses as to

identification and alibi, which are pretty fundamental issues in any trial. It is felt that this will overcome one very serious injustice. Under the present law a person under these circumstances, having the preliminary issue of fitness to stand trial being first determined, and having it determined that he is unfit, is incarcerated, the ultimate determination as to his guilt or innocence is indefinitely postponed and may very well be indefinitely postponed, and he has a charge hanging over his head for which he is never really convicted or acquitted. It is hoped that amendments to the law will cure this serious defect.

I think, Mr. Chairman, with those few preliminary remarks, Mr. Swadron would be most helpful at this stage.

The CHAIRMAN: Thank you very much, Mr. Munro. I think Mr. Scott would like to ask a few questions.

Mr. SCOTT (*Danforth*): I have one or two very short questions.

First of all I would like to congratulate the member for bringing this important matter to the attention of the Committee.

In looking at your outline I get the impression that you have restricted the bill to the question of fitness at the time of trial. To most of us the real problem is the mental condition of an accused at the time of the commission of the crime and some revision of what a lot of us think are the antiquated rules covering that. I just wondered whether you had given any consideration to this and why you would restrict it merely to the mental condition at the time of the trial rather than dealing with the broader problem of modernizing rules as to the time of the crime itself.

Mr. MUNRO: I agree with you on that, Mr. Scott. I felt that that whole subject matter opened up another whole area for consideration which could be the subject matter of another private member's bill to go into; it is certainly worthy of a good deal of attention on the part of the Justice Department and the government. But, intentionally, I brought forth a bill restricted to this one point.

Mr. SCOTT: You mean the subject matter that is before us.

Mr. MUNRO: That is right.

The CHAIRMAN: Is there anyone else who would like to ask Mr. Munro any questions before we call Mr. Swadron?

Mr. Swadron, we would be glad to hear from you now.

Mr. B. SWADRON (*Director, Study Project on Mental Health Legislation, Ontario Department of Health*): Thank you, Mr. Chairman.

Perhaps in my presentation I should describe the nature of the issue of fitness to stand trial at the outset. It does relate to the mental condition of the accused at the time of the trial and for the purposes of the trial, and it is something which is artificial and relates only to the way in which we try individuals. The principle has always been that it is unfair to place a man on trial when his mental condition is such that he is unable to make full answer and defence. There seems to be a lot of confusion which would make some people believe that a person who has been found unfit to stand trial has been implicated in some way and is guilty, or that he has had something to do with the offence charged. That is true in the case of a person who is acquitted on

account of insanity; in other words he is found to have committed the act with which he is charged, but he is excused from criminal responsibility. Again I mention that that is not the case with the finding of unfitness to stand trial.

Another very important factor is that a finding of unfitness to stand trial is not equivalent to a finding by physicians that a person requires mental hospitalization. Perhaps Dr. Boyd would mention something about that.

Now the procedure following a finding of unfitness to stand trial is clear. The person is automatically detained, probably in a mental hospital. It is actually at the pleasure of the Lieutenant Governor of the province, and the Criminal Code does not specify the place of detention but, invariably, it is in a mental hospital. There is no appeal against a finding of unfitness to stand trial and when a person has been so found there is no procedure whereby as of right he can get his trial heard; he cannot get back to court by any proceeding on his own motion.

I think it is fairly clear that the current law must be re-assessed, and in the editorial in the *Canadian Bar Journal*, which has been circulated, the case for amendment is set out there. There are a number of problems encountered by hospital authorities when they receive persons who are unfit to stand trial and I am sure that Dr. Boyd will have something to say about that.

Now in the United Kingdom in the 1950's there was a conflict of authority as to whether a trial could proceed if a person were unfit to stand trial, the argument being that the defence might have within his battery a good defence, or the prosecution might not succeed in proving its case. There were cases wherein the trial of the fitness issue was postponed until part of the trial on the merits of guilt or innocence would be determined. Those cases were not always followed and it was decided that it had to be considered by the criminal revision committee in the United Kingdom and if there were going to be any definite principle developed it would have to be in legislation.

Now the very issue was considered by this committee and the majority of the members were in favour of postponing the issue of fitness to stand trial and they came to the conclusion that there were four possible courses to follow. I have set these out in the presentation.

The first alternative was that it should be postponed up until the opening of the case for the defence. That would mean that the prosecution would submit all its evidence and it would be open for the defence to move for a directed verdict on the basis that the Crown had not proved a *prima facie* case. Ultimately, that was the course that was selected by the majority of the committee and adopted into legislation in the *Criminal Procedure (Insanity) Act, 1964*.

The second alternative was up until any time before the verdict, and there were several arguments against that possibility; they were mainly procedural arguments. There was some worry that the jury might ultimately have too many questions to decide at the time the verdict was to be rendered. They might have to decide whether or not the person was fit to stand trial, whether or not he committed the act with which he is charged and also, a third possibility, whether or not he would be acquitted on account of insanity if it were found that he had done the act with which he was charged.

The third alternative was to proceed with the trial in the ordinary manner and come to a verdict, and then after the verdict decide whether or not the defendant had been fit to stand trial. That course was criticized inasmuch as it would be possible that the man would be convicted, and even though the trial of the fitness issue would be considered after that they felt that it would be an unfortunate course to label a man as guilty if it turned out that he was unfit to stand trial.

The fourth course was to try the issue of fitness as soon as it arose but proceeding with the trial in any event, in other words, if the question of fitness was raised they would determine whether he is fit, and even if he is unfit they will continue with the trial to see whether or not he committed the act. That course was felt undesirable inasmuch as perhaps for a large part of the trial they would be trying a man who had already been declared unfit to stand trial. As I mentioned before, the first course, the permissiveness of postponing the issue of fitness up to the opening of the case for the defence was adopted.

Now applying the considerations with which I have just dealt to the bill in question here, Bill No. C-176, I think there is very little room for argument that the bill is unsound; it is clearly sound. In dealing with perhaps hundreds of people who are interested in this subject I have found no one who would deny the validity of the principle in the bill.

The bill itself goes a little further than the United Kingdom situation; it states expressly that the trial judge may call, during the case for the prosecution, witnesses who would tend to prove either the defences of identification or alibi, and this would be during the presentation of the prosecution's case. In that respect the bill goes further than the British system.

Now it seemed to me, as far as limiting the defences which could be introduced, that there was no need to do that, and I thought of one particular defence that was not included in the bill which certainly could be, and that is the defence of self-defence. Perhaps I will take a minute to describe the case of which I have knowledge.

Two mentally defective persons were loading wood on a cart and accidentally a piece of wood hit one of the defective persons who thought that it was the other person who had hit him and he thereupon attacked whom he thought was his assailant. In self-defence the one who was attacked killed the other person, and being that these persons were defective I think perhaps had there been a charge it would never have got to the criminal charge stage. Had there been a charge he might well have been found unfit to stand trial and I feel that he would have had a good defence of self-defence. Therefore, I think the bill could well be expanded in that respect to include self-defence and I feel, furthermore, there is no need to limit the defences which can be offered. I think it would be well to express this amendment to have a procedure which would be equivalent to the Criminal Code and provide for all defences as in any other case.

Now in regard to the point of the trial where it would be permissive to postpone the trial of the fitness issue I would submit that there is a strong argument to postpone it until all of the evidence is heard.

An hon. MEMBER: On both sides?

Mr. SWADRON: Yes, sir. That would include reply evidence by the prosecution, if there were any. It would allow the possibility, and include the principle in the British bill, where a directed verdict of acquittal could come after the evidence for the prosecution; it would not take away from that. It would allow the opportunity for the defence to give his complete battery and then, after all of the evidence is in and there is a little contention as to this point, I must admit that there will be procedural difficulties—of that there is no doubt. But the over-all principle is that if we have sufficient flexibility we might be able to accommodate all cases. Another overriding principle is the discretion in the judge; he would always have the opportunity to call for the fitness issue at any time if it appeared that there were procedural difficulties. I would just like to leave the door open to continue to this point in a case where it is indicated. After all the evidence has been submitted, if the issue had not been called for up until that time, I would make it mandatory for the issue to be tried. If the person were found fit to stand trial the trial would proceed in the ordinary fashion and all of the evidence at that point would have been in and we would not have been at a loss for evidence. If he were found unfit I would allow the court to instruct the jury that this trial had been unfair from the point of view of the accused and therefore we cannot convict him, but it is open to you to acquit him if you feel that there is a reasonable doubt as to his guilt, even though the trial had been crippled to a certain extent—it has been crippled against the accused but the prosecution has had useful opportunity to present his case and it might well be that even though the accused has been at a disadvantage he may be entitled to an acquittal.

Now there are difficulties involved with that; it has been set forward that once having found a man unfit to stand trial the jury would be reluctant to bring about a verdict which might involve his release because they might feel that the finding of unfitness is very close to the fact that he is mentally ill and he is perhaps charged with a serious offence and they may be reluctant to bring in that verdict. It is my personal opinion that with a proper charge to the jury that this could be overcome, and I would not leave the two issues to the jury at the same time. In other words, I would ask them to find out or to determine whether or not he is fit to stand trial. If they do bring in a verdict of unfitness then they will be charged on the second question and it would be made clear at that time that it is not open to convict him but only to acquit him.

As an advantage, if all of the evidence were on the record, I think ultimately the hospital authorities would be in a very much better position than they are now. It so happens that many persons with respect to whom the trial of the fitness issue is tried at the outset of the trial are sent to hospital, and the superintendents of the hospitals have virtually no reliable evidence upon which they can judge what the proper course would be with respect to the individual. Perhaps Dr. Boyd will mention something in that regard.

Mr. SWADRON: Of course all of the evidence would be in for later disposition, if necessary. In some cases where a man is tried perhaps 10 or 15 years after the occurrence, if he is sent back to trial after having been found unfit many years before, often the case for the prosecution will have been lost and witnesses will have died, and many problems would be encountered in that respect.

I should mention that Ontario has had difficulties with the administration of these problems so much so that certain informal hearings were arranged to consider the cases of persons who were found unfit to stand trial, but where there was a claim that the person was innocent and he would not be detained in a mental hospital were it not for this outstanding charge, because detention in a mental hospital does not depend merely on the medical aspect; it is a question of the person's conduct and dangerousness as well.

Now I thought perhaps I would just spend two or three minutes on the second section of the bill, which deals with appeal. When the appeal appears in the British Statutes it sets forth the grounds of appeal and it mentions that there would be an appeal as of right against the question of law and under conditions if it were on other grounds. I think this is an important principle that must be followed in accordance with our own Criminal Code and that those conditions should be added along similar lines to ordinary appeals against convictions or acquittals.

Now that deals with the question of appealing against an unfitness finding. It so happens that in the wording of Bill No. C-176 there is mention made of an appeal against a special verdict. Now a special verdict in that sense means an appeal against an acquittal on account of insanity and we do not have such a right of appeal; therefore the wording as mentioned in the bill is inapplicable to Canada. That wording was copied from the British bill but it is significant to note that in another section of the British bill they created an appeal against an acquittal on account of insanity and therefore they made reference to it in their bill which we copied. Since it has been mentioned within the scope of this bill I would suggest that there is a strong argument for an appeal against an acquittal on account of insanity and that should be inserted as part of this bill; it would be a logical part of it.

I think perhaps that is all I have to say.

It has been brought to my attention that the Hon. Mr. Wishart, Attorney General for Ontario, has sent a letter in respect of this bill and perhaps I will read the pertinent portions.

I have now had an opportunity of pursuing this bill and, as I have already indicated, the principle is, in my own opinion, a sound one. However, my information is to keep to an absolute minimum any changes which would be made in the procedure at the trial, and along these lines I would suggest that the trial judge, once having postponed the trial of the issue of fitness to stand trial, should then follow the usual course of considering, at the end of the Crown's case, whether there should be a directed verdict of acquittal. If the presiding judge does not direct a verdict of acquittal then he could allow the defence counsel to adduce the evidence in support of particular defences which would be specified by the judge. When this evidence was completed the jury would then be asked as to whether it had any reasonable doubt of guilt at that particular stage. As you know, our whole procedure is developed in accordance with our body of law to reach the present stage which, I feel, is an excellent one designed for the best interests of the accused and the public. In introducing these provisions for the particular problem I would be loathe to see

any drastic revisions of criminal trial procedure if the point could be accomplished in a manner more accommodated to our trial system.

The CHAIRMAN: Thank you very much, Mr. Swadron; that was very interesting. Now there are a few questions some of the members would like to ask you. Mr. Scott, do you have one?

Mr. SCOTT (*Danforth*): I was going to ask if Mr. Wishart's letter could be part of our minutes.

The CHAIRMAN: Well, you can put it all in, but the body of the letter is on the record now.

Mr. SWADRON: Yes; actually I read the complete text of the letter. I had mentioned they were the pertinent portions.

The CHAIRMAN: Are there any questions of Mr. Swadron?

Mr. BALDWIN: Now on the question of insanity, the wording of the bill—and this is a point which occurred to me right away—is, in 524 (1): "Where on the trial of a person the issue arises, at the instance of the defence or otherwise, whether the accused is on account of insanity . . ." When I first looked at that I thought this is not a very happy word to use because we might be driven back then to the definition of insanity, which appears in the Code and which, of course, is very drastic. On the other hand I am looking at that particular section, and that definition is limited for the purpose of the section alone on the general issue. But there is some resemblance there and I am looking at this from two points of view; from the point of view that I was counsel defending and had raised this issue myself as to unfitness to plead, the type of insanity which I would hope I would be compelled to establish, or that the court or the jury would find, would be probably of a minimum kind, whereas if the Crown prosecutor or the Crown had raised this issue I would naturally expect that the degree of insanity which they would be compelled to prove would be a lot more substantial than the one I would be compelled to prove if I had raised it. Now probably in the course of time, and trial and error, the courts may evolve what they think is a fair test of insanity, but I notice that in the English statute they have used the words "under disability", and this has been interpreted, I imagine, over a period of time, to cover a situation where the accused has not the capacity to defend or to instruct his counsel. I think this is pretty well a test, is it not, which they take?

What do you see is likely to happen if the bill in this shape is adopted and the word "insanity" is left in in its present form without any further effort to either change it or refine it? What do you see is likely to happen in the course of time and trial of these issues as to what the courts would fix as being the meaning of insanity as used in this bill?

Mr. SWADRON: Thank you. Well, the criteria for fitness to stand trial of course has evolved over the years under the common law. I think that you have a very good point inasmuch as the jury is sometimes confused when in the same trial they might be considering the fitness issue and the question of criminal responsibility in that they mean, is the person mentally ill or was he mentally ill, and they might tend to equate the two different meanings of insanity, which is very unfortunate in a case perhaps where a man is the

subject of a trial of an issue of fitness and he is found to be fit to stand trial the jury might be reluctant to bring in a verdict of not guilty on account of insanity because they have already had a determination as to his mental condition. So I do think that the term could well be changed. I would note the very wording of the English section, if I might just read it here:

Where on the trial of a person the question arises at the instance of the defence or otherwise whether the accused is under disability, that is to say under any disability such that apart from this act it would constitute a bar to his being tried.

Now over the years that disability in England could have meant that the man did not speak English and there was not an interpreter, or he could be deaf and dumb and there was no sign language with which they could communicate to him. I think by and large all of those possible circumstances arising are doubtful and that even though it does not use the word insanity in the English act it is intended to mean his mental condition in relation to the trial. But I think that it is a point very well taken that the term "insanity" in section 524 of the Criminal Code could well be changed in this respect. I think perhaps why it was not changed was to leave the provisions of 524 untouched where possible and limit it to the terms of the amendment.

Mr. BALDWIN: Then at that same stage of consideration, the question arises as to the initiation of this particular issue and the burden of proof. I am judging that what probably would happen would be to the same extent as a general issue of insanity, that it would have to be established by probabilities rather than any discharge beyond any reasonable doubt. I think this is the issue in insanity cases generally and I suppose the same thing would apply here. Would that be your view?

Mr. SWADRON: Yes, I would agree with that.

Mr. BALDWIN: Yes. There is nothing said in the bill and I am taking it that this probably would be a judicial interpretation.

I have one more question and then I will vacate the field. I was very interested, Mr. Swadron, in the point you raised as to the stage at which the issue would arise and your suggestion that subsection (3) of section 524 as proposed in the bill should be enlarged so that any defence might be available on which the counsel for the accused could ask the judge to call witnesses. The point that strikes me from a practical situation, having in mind my own experience as counsel, would be that if this was tried before a jury and you hoped that you could rely upon the jury to find on the issue that there was unfitness to plead, this might well inhibit you in your relations with your client at the trial. Now a constant communication between counsel and a client at the trial is very essential to the proper conduct of a criminal action, and the two particular issues of identification and alibi are defences which can be raised and substantiated on the basis which does not at first blush require this communication between client and counsel; they are defences which, in order to establish them, you have access to other people. Now I would think that if I was defending a man on this issue on the possibility that if there is a finding against me on the issue of unfitness I might be then compelled to ask the same jury to

decide, on the same evidence, on the general issue, I might be in something of a dilemma, knowing that this evidence which is going in would be the evidence on which a jury might on the general issue of guilty or not guilty have to make a finding. This might inhibit me because if I had this constant communication with my client, which normally you would have, the jury would say well, this accused person is quite obviously well able to conduct his defence; he has the capacity to instruct his counsel and, therefore, *prima facie* on the plea of unfitness we are going to automatically find against him. I was wondering if it would be possible to find an intermediate stage here where certain specific defences, such as the two that are mentioned, could be made mandatory but, at the direction of the court, any defence of a kind which did not require this communication between counsel and client in the court, where the counsel takes initiation and goes to the judge—I mean makes an application to the court and says will you call a witness on this particular issue, might be determined by the judge rather than leave it open. It might put counsel in a very difficult position. Maybe I am thinking too much as one who has had a lot of experience in these things but it is a point that has occurred to me and I would like your view on that.

Mr. SWADRON: It seems to me that if the issue of fitness arises to the extent that we will be looking at these sections the judge will be well aware that that is a possibility, a very good possibility that he is unfit to stand trial, and throughout the course of the trial the judge could bear that in mind and it would be open to him to call the trial to a halt if at any time it were felt that it would be unfair to the defence. Am I correct in assuming that one of your statements was that if it was felt that the accused was unfit, if you were conducting the trial and you seemed to be getting instruction from him, that the judge will—or the jury will—

Mr. BALDWIN: The jury; I am not thinking of the judge—the view that the jury is going to take if counsel and the client are in constant communication and carrying on discussions. The jury I think are likely to hold that the accused is fit to stand trial if he is able to instruct counsel.

Mr. SWADRON: Yes. Well I am wondering whether on the fitness issue if the judge would make a point of bringing that to the attention of the jury, that we have been conducting this trial, in view of the purpose of this amendment, for better justice; it might have been that the person has been fit to stand trial and there has been some worry about that during the trial but now we have decided to call the trial to a halt to determine that very issue.

Mr. BALDWIN: I just saw that show the other day “Twelve Angry Men” about twelve jurors.

Mr. SWADRON: Yes, I agree that there are a lot of procedural problems involved.

Mr. SCOTT (*Danforth*): I was going to raise this issue but I had intended to wait for the other witness. It seems to me that the bill in its present form creates a view to limit, in dealing with the issue, unless you have a pretty clear spelling out of what you mean by insanity, because it seems to me every judge will make his own interpretation of what he feels insanity within the terms of the bill should be.

Mr. SWADRON: I would think that it is very clearly set out, although the criteria are not spelled out within the Code. It is very clear within the common law and I know of no recorded case within the last score of years where there has been any difficulty in determining what the test for unfitness to stand trial is and the reason it was not discussed here is because it was not felt to be a problem and there is no change contemplated by the bill. Do you wish me to go through the criteria?

Mr. SCOTT (*Danforth*): You may as well put them on the record.

Mr. SWADRON: Yes. I do mention in the editorial that in order to be fit to stand trial the accused must have the capacity to understand the nature and the object of the proceedings against him. I would split that into two criteria: He must know the nature of the proceedings, that it is a trial, and he must also know that they are directed against him; and he must comprehend his own condition in reference to such proceedings and he must have the mental condition to make a rational defence either personally or through counsel. Now there are other considerations involved which could be considered under those general criteria; one of them, would he be able to challenge a juror who is his arch enemy—that has arisen once or twice. But generally those ones which I have mentioned are the accepted criteria and while there might be confusion in certain people's minds as to what they are I would submit that they are very clear.

Mr. SCOTT (*Danforth*): The other point is the one Mr. Baldwin raised and I would like to go back to it for just a moment. In the trial of an issue of this sort as to the fitness it seems to me you are likely to end up with conflicting professional testimony. That is the Crown will call their psychiatric evidence which often is that the man is fit; the defence will call theirs which would be that he is unfit. Then you let the trial continue and the problem comes up where here they are watching the man every day talking to his lawyer, giving him instructions, and he does not hesitate; he carries them out. Is there not a danger there that the jury, when it comes to decide the issue, will make a relatively uninformed guess.

Mr. SWADRON: Well, sir, when you mention you would let the trial continue I assume you meant the person was found fit to stand trial because there is no scope under any of these recommendations or submissions for allowing the trial to continue beyond the finding of unfitness.

Mr. SCOTT (*Danforth*): I know, but you suggest that the finding can come at a later stage.

Mr. SWADRON: But once the finding of unfitness to stand trial comes it is at the end of all the evidence, I would still allow the opportunity for the jury to acquit him, but there is no continuation of the trial such as evidence of anything like that. The determinations would come one after another.

Mr. SCOTT (*Danforth*): There is something there that bothers me but I cannot put my finger on it.

Mr. BALDWIN: I think I should mention again, not on these issues here but on the point that you have raised, of a possible enlargement of the act, that their evidence is being led. Let us assume that the counsel for the accused after

the Crown has pleaded its case asks the judge to call witnesses pursuant to subsection (3) on any defence at all—on the main defence. Your suggestion is as to enlargement of (3)?

Mr. SWADRON: Yes.

Mr. BALDWIN: Yes, and the judge accedes to that request and calls a series of witnesses. There is the time relationship between the calling of these witnesses and the actual calling of the psychiatric witnesses on the issue of fitness or unfitness to plead.

Mr. SWADRON: Well I think on the issue of fitness to stand trial and the psychiatric testimony, the particular psychiatric testimony on the fitness issue would not be called until the issue arises.

Mr. BALDWIN: Yes, this is the point. The purpose of your suggestion is that it could be postponed until in effect the case that the accused would put in on his behalf would have been completed and at that time, then, the question of fitness or unfitness of the accused to plead would be dealt with by evidence. I think that what Mr. Scott and I had in mind was that during the course of the calling of the witnesses by the judge and the examination of those witnesses counsel may be well compelled—from time to time to have communication with his client and that will be obvious to the jury prior to the time that the psychiatric evidence has been called and there being a decision by the jury as to the fitness or unfitness to plead. Now this puts the accused, particularly the counsel for the accused, in a difficult position, when there has been a particularly damaging question asked by Crown counsel and he does not know the particulars, and he may need to re-examine or to cross-examine on that; his cross-examination normally would necessitate a conference and discussion with the accused in the court. This is bound to have some impact in the minds of the jury who will be called upon ultimately to exercise two functions: to decide whether or not the accused is fit or unfit to stand trial. If, having decided he is fit to stand trial it then will be called upon to decide whether he is guilty or not guilty. Now this is the point I am getting at. Perhaps it seems a little far fetched but I can see it happening; I think I can see it happening quite frequently.

Mr. SWADRON: I would just mention to you at this point that it is possible even under our present law to have the trial of the fitness issue at any time before verdict; this trial might have lasted for weeks, and at the end of the two weeks the counsel might get up and say "I feel that I would like a trial on the fitness issue" and in the same way it might have the effect of making the jury reluctant to find him unfit under this bill that is introduced. That has been the case for some time. In other words, it could arise later in the trial and the jury has seen the consultation.

Mr. SCOTT (*Danforth*): What is the argument against having it tried as soon as the charge is read?

Mr. SWADRON: Well, under our present system it automatically means that the person is detained under the warrant of the Lieutenant Governor without having tested the prosecution's case nor allowing the defence to submit any evidence, and they can maintain that they are innocent and they have not had a chance to prove it. Under all of the proposed amendments it would be possible at least to test the prosecution's case or, in the wider scope, to allow the defence

to submit its case, and there would be room for an acquittal; whereas often in cases under the present system there is no chance for the case to even get off the ground.

Mr. SCOTT (*Danforth*): A two-fold dilemma, I can see.

Mr. SWADRON: Yes, and granted, it might be unfair to the accused that he has been communicating with his counsel and the jury might be loath to find unfitness to stand trial, but in the over-all picture we are placing some accused in a better position than they were before, and I do not think any disadvantages outweigh the extreme advantages that we stand to get.

Mr. LAFLAMME: I would like to ask a question related to the one asked by Mr. Scott. As a counsel would it be fair to hide the fact the client is not fit for trial until the verdict comes.

Mr. SWADRON: Well, I do not think he is hiding it. He is certainly not hiding it from the judge, because any postponement is at the discretion of the judge and he will allow a postponement according to the very terms of the section only where it is in the interest of the accused. So all these factors may be weighed; we might have requests to postpone the issue but the judge in his discretion may say that it is unfair, in that particular case that you mentioned, and would not allow a postponement of the issue. I think the safety catch is built into the various terms of the section.

Mr. LAFLAMME: I read in paragraph 2(a) points of view following a fitness finding: "no appeal available against a finding of unfitness." Why should there be no appeal on that? It is a matter of public interest. It is quite easy for the accused to try to demonstrate that he is unfit to stand trial. Why could there be no appeal in that case?

Mr. SWADRON: Oh, I am sorry; I meant in that sense that there is no appeal currently against a finding of unfitness. I recommend that there should be. I was just outlining the current procedure and what happened after a finding of unfitness. I am sorry; that has to be considered in context and I am just stating the current position.

Mr. AIKEN: I just have one question, Mr. Chairman. Under the bill would there be anything to prevent counsel from permitting the trial to proceed right to the point of conclusion, where he has put his defence in and then believing he was not doing too well raised the question of fitness to stand trial.

Mr. SWADRON: Yes, he could raise it. He has already raised it, mind you, because this trial is proceeding on the assumption that it is in the interest of the accused, but he might argue that it is no longer in the interest of the accused, and he might think, "I am not doing too well, I think perhaps things are going sour for me. It is true that my man is unfit to stand trial. Under the general law he should not have been tried in any event. It is only where I can get him some justice that we have been going this far and I think that the judge should accede to that request".

Mr. AIKEN: Well assuming the question has not been raised at all in the normal course of the trial; will he right at the conclusion be permitted to raise the issue?

Mr. SWADRON: Oh, yes, I think it is very important that a person not be in jeopardy of being convicted if he has been or is unfit to stand trial. Indeed the question of fitness could arise under our current system more than once during the same trial—and there have been cases where a man has been tried; the counsel doubts his fitness and he has been found fit, and then a couple of days later during the course of the same trial the defence counsel says, “I think he is unfit now, let us try it”, and I think in a proper case the judge must try it all the way along. He must be fit to stand trial during the complete course of the trial.

Mr. AIKEN: In that case then, Mr. Baldwin’s concern about communication between counsel and client may have a reverse effect on the jury too; they might assume that the counsel was not able to communicate.

Mr. SWADRON: Exactly. And under all these considerations the jury is going to consider back to see whether the person was unfit at any time during the trial. Under the current system you can have a successful appeal against a conviction if you can show that at any time during the trial the accused was unfit to stand trial.

Mr. BALDWIN: It might be true that counsel is unfit to conduct the defence.

Mr. CHOQUETTE: I have just one question. A statute was passed in 1964. Have you in mind any case that would show the efficiency of those amendments, or is it too early?

Mr. SWADRON: I believe it is too early. I must admit that I know of no case decided under the system in the United Kingdom, but I know of several cases in Canada which could benefit from the postponement of the issue.

The CHAIRMAN: Are there any other questions? Mr. Honey, you have not asked any questions yet; do you have anything?

Mr. HONEY: There is one thing that comes to my mind and I will have to admit that I am not an authority on criminal law. Mr. Swadron, you mentioned that under our present procedure the issue of fitness could be tried even after all the evidence was in?

Mr. SWADRON: Yes, any time before a verdict.

Mr. HONEY: Then this would normally, I would think, be done on the volition of the defence counsel; the motion would come from defence counsel?

Mr. SWADRON: I would not say that, sir; I would say that the defence is in a better position to assess the possibility of unfitness to stand trial than is anyone else because of the close contact by defence counsel, but it is federal law that the issue may be raised by the court or by the prosecution as well as by defence.

Mr. HONEY: But normally it would be raised by the defence. Could you tell me briefly then how will this amendment enhance the position of the accused with respect to having a conviction registered against him because, as I understand it, on this amendment the issue of fitness may be tried, as set out here, at various stages, and part of the defence may be adduced, as you mention in subsection (3) and then the issue tried. How does this protect or give the accused a better status than under the present law?

Mr. SWADRON: Because his status under the present law might well be that no evidence is called.

Mr. HONEY: I appreciate that, but this would have to come by the volition or the initiative of the judge, would it not?

Mr. SWADRON: That the issue will be postponed?

Mr. HONEY: No. Under the present law it is not necessary to try the issue of fitness at the outset of the trial, is it?

Mr. SWADRON: If it arises and the argument in favour of it is sound. For instance, if it arises and the judge is of the opinion that it has arisen, then the practice is that it must be tried.

Mr. HONEY: Well the point that bothers me is that it would seem to me the judge would have discretion now, and this may not be the case as you indicated; but the judge certainly would be aware of the risks or the unfairness to the accused of trying the issue of fitness before the other issue of guilt or innocence is tried.

Mr. SWADRON: You mean under the current law?

Mr. HONEY: Yes, I am talking about the current law. Now if the judge says that before we hear evidence on the guilt or innocence of this accused we are going to try the issue of fitness. But why, under our present practice, would the judge not have the discretion to postpone the trial of that issue?

Mr. SWADRON: Well I could put it this strongly, that there is no clear authority which would allow him to do that. There is no mandate that he cannot but I think our position is similar to the position as it was in the United Kingdom a few years ago, where they thought that anything short of statutory amendment would not make it clear that the judges have that power, and from my experience in the past I would say that most judges, if not all, would say that there is no power to postpone the issue once it is introduced and they feel that it is an issue.

Mr. HONEY: So it is not a provision of the Code as it stands now but it is a practice that has grown up?

Mr. SWADRON: Exactly.

Mr. HONEY: Thank you.

Mr. AIKEN: Furthermore, Mr. Chairman, without the express provision of this section the judge might feel himself without jurisdiction if he permitted counsel to cross-examine Crown witnesses without being properly instructed.

Mr. SWADRON: Exactly.

Mr. MUNRO: On that point, if I could just refer to these summaries of two cases that led up to the enactment in England, on page 2 the classic statement of the English common law position is summarized in the case of *Rex v. Beynon* (1957) 2 Q.B. 328. In this case the Crown submitted that there was a question as to the accused's fitness to plead. Counsel for the defence requested that the general issue be tried first "so that the accused is not deprived of the possibility of being acquitted". The trial judge rejected this contention on the basis of authorities that a man cannot be tried for a crime unless he is in a mental

condition to defend himself. *Devlin*, J. in *R. Roberts*, (1954) 2 Q.B. 329, came to the opposite conclusion. I do not believe that case was upheld. Is that correct?

Mr. SWADRON: Well, it was not followed. That was the concept of the authorities which I mentioned which invoked the British bill.

Mr. SCOTT (*Danforth*): You read us a letter from Attorney General Wishart of Ontario. Has the bill been shown to any of the other similar officials in the province and are there any letters of comment from them?

Mr. MUNRO: No. I submitted the bill to the Attorney General because he was involved in the Farewell case and asked for his opinion so that it could come before the Committee, and then I wrote to the Minister of Health, and the Chairman did also, for permission for Mr. Swadron to come and Mr. Swadron's views were known to the Minister of Health of the province.

Mr. SCOTT (*Danforth*): The reason I asked, at one of our early hearings we had a bill dealing with an amendment and we decided to send it, together with a copy of the minutes, to all the attorneys general.

The CHAIRMAN: That was Mr. Forest's bill, the one about the run away driver, the hit and run, and we thought it might be appropriate to get the views of the attorneys general.

Mr. MUNRO: I could have done that. The only reason I singled out Ontario was because several of these cases, really two or three in the last two of three years, brought this question to a head. It has occurred in Ontario principally.

Mr. SCOTT (*Danforth*): I think it may be worth doing after the witnesses have given their testimony.

Mr. BALDWIN: Mr. Chairman, I have one more brief question to ask. The point that I raised I suppose might be met if we adopted the procedure which is in the Criminal Procedure Amendment Act of the United Kingdom in 1964 where if the question of fitness is to be determined on arraignment by a jury other than that which determines the issue if it is to be determined at a later date it should be determined by a separate jury or by the jury by whom the accused is being tried as the court may direct. In other words, if we took your suggestion and widened subsection (3) to include the calling of witnesses as to any aspect of the defence and left it free to the judge on application to either try with the same jury, if it were the kind of defence which could be well tried in that way, or to impanel a separate jury to try the issue of fitness and another jury, of course, would try the question of whether guilty or not guilty.

Mr. SWADRON: I think that is a very good point, sir, and it could not be argued against that that this new fresh jury which has been just impanelled was seeing this man for the first time because under our present system that is what often happens. The accused is brought into court and the issue of fitness is passed on. There is a charge of guilt and, of course, there is evidence brought on that point.

Mr. MATHER: Mr. Chairman, I have just one question. Is there any data in relation to the procedure in the American courts?

Mr. SWADRON: I have an article which I wrote and published in Philadelphia which outlines the federal system of fitness to stand trial. Of course it does not deal with all 51 jurisdictions in the United States, just the federal system. I have a fair knowledge of what is going on there. I would say that there is, as far as I know, nothing as good as has been enacted in the United Kingdom or as has been introduced here. I have these articles if you wish copies of them.

Mr. MATHER: Could you indicate what is the extent of this issue in Canada; that is, how significant is it? Are there many cases involved?

Mr. SWADRON: I think this is a good opportunity to ask Dr. Boyd, if it is permissible, because he has a concentration of so-called criminally insane in his hospital in Penetanguishene.

Mr. MUNRO: No, I would like to have Dr. Boyd but, in answer to that, I think that there will be future witnesses, Mr. Chairman, if the Committee desires to hear them, from the Canadian Association for the Mentally Retarded also.

The CHAIRMAN: Dr. Boyd, may we call upon you?

Dr. B. BOYD (*Superintendent, Ontario Mental Hospital, Penetanguishene*): Thank you, sir. I appreciate the opportunity to come down and meet with you gentlemen.

As background I might mention that the maximum security or Oakridge division of our Ontario Hospital at Penetanguishene has beds for 304 men. About half of these have come to us from courts, reformatories of penitentiaries and about half have come to us from other Ontario hospitals because they are difficult to manage. We are the only maximum security facility in the province and therefore we do get a concentration of offenders who are considered potentially dangerous and who require mental hospital care.

Yesterday I asked the staff to dig out the files of those patients whom we are holding where there still is a charge outstanding against them, and they got me out 68 files which I went through yesterday morning just to get a kind of a cross-section of the type of person that we are holding with a charge who has not had a fair hearing.

Now looking through the 68 files I would think that all but about 20 are clearly so mentally ill still, at the present time, that they obviously require to be in a mental hospital so that perhaps no injustice is being done to them in depriving them of their liberty. However, the longer they run without trial the more difficult it is going to be for them to have a fair trial. One or two examples might illustrate that. I had a boy who was admitted, charged with murder, and considered unfit to stand trial as, indeed, he was. He was a culturally deprived mentally defective. Twelve years later, in the cultured environment of our hospital, he had matured and his I.Q. had risen to the point where we felt he was fit to stand trial. We recommended that he go back to stand trial and the Crown Attorney managed to rally a few witnesses that were still alive and there was a trial. He was acquitted. Now if the jury was right, that he was not guilty, there may have been some sort of an injustice done in holding this boy in hospital for twelve years. Incidentally, he is now out in the community and he is doing reasonably well.

Another boy, a mental defective, was sent to us on a mentally ill certificate and the police dropped in to indicate that he was their chief suspect in a murder and please do not let him go. That put us in rather an awkward position because he was not sufficiently defective to keep in hospital and if, indeed, he had not committed this offence it would be only proper to release him whereas, if he had committed the offence, he should be kept in hospital for quite some time, and we did not know what to do with him. In this case we managed to get the Crown Attorney to prepare the case, get his evidence collected, until he convinced us that the fellow was indeed probably the offender, and we actually sent him back to court where he was found unfit. By this time we were satisfied that he probably committed the offence.

But this whole system thrusts upon the hospital superintendent and his staff the decision as to whether the offence was committed by the patient or not, and very frequently that is a most important factor in our disposal of the case. The present system labels these people guilty until proven innocent and that is about what it is, because when they come to us with a serious charge we have to assume that they did it. We cannot let them go free where otherwise they would be fit to release in many cases.

I could illustrate another case where we had two patients sent to us charged with murder and unfit to stand trial. They had each confessed to the murder; the interesting thing is that it was the same murder and they each claimed they did it alone, so I presume in this case that the first to recover goes back and takes the rap.

From our point of view, in the hospitals, it is clearly very desirable to get this decision put back in the hands of the court and to get as much of the evidence heard that is possible and to have the trial occur as near to the time of the offence as possible.

Those are some of the highlights of what I wanted to say. In regard to this word "insanity", of course, it bothers us psychiatrists; we dropped it thirty years or so ago. The only time we run into it is when we are talking to lawyers. It is in the class with "lunatic". Historically, it is a very interesting word; it has to do with uncleanness—unclean spirit, I presume—and personally I would like to see the word "disability" rather than "insanity". So many people assume that mental illness is a matter of black or white and it is embarrassing to us in court to have to say whether a person is or is not mentally ill because, in a way, we are all mentally ill to some extent.

I would like to compare it to physical illness. You very seldom ask is this man physically ill or is he physically healthy, and if he is physically ill you take away all his rights. A man may be physically ill and be quite capable of driving a car but not capable of climbing, say, a ladder. We have to put the particular skills required against the disability caused by the illness and, of course, it is the same way with mental illnesses. A person may be certifiably mentally ill and yet still fit to stand trial, and yet so often the courts will refuse to have the trial unless we will say he is not certifiably mentally ill. I do not think that is the issue because he may be fit to stand trial. Then, of course, the question of insanity under Section 16 is another separate issue both in time and in skills required. I would just like to make that point.

Mr. BOYD: Once they have come to us they need to have a greater degree of mental health to get out. That is, the criteria, or level of mental health required for release are somewhat higher than the criteria responsible for coming in. When we recommend that a man go back to court not only must he be fit to stand trial but he needs to be likely to remain fit to stand trial until the trial is over. I am afraid in many ways he needs to be a fit and proper person to release to the community. That comes into it and I do not think it should.

Mr. RYAN: Is the effect of that that a man must be unlikely to be dangerous to himself or to others if released. Is that the test?

Mr. BOYD: It tends to be but I do not think it should. It should be fitness to stand trial, period.

Mr. SCOTT (*Danforth*): Then why does your consideration of his committing of the offence enter into it? I am sorry to press it but I am not clear as to the connection.

Mr. SWADRON: Might I offer something in that respect. After a man has been confined for several years it has been the practice, when considering the disposition, to point out the possibility of discharging him directly into the community. There have been cases of persons having been found unfit to stand trial spending several years in the mental hospital and then the question is can we get him out of the hospital. There is a practical alternative of sending him to the community; the attorney general or the crown attorney involved might take the position that we could never get a conviction now and there is no sense in prosecuting further. So there is the alternative of discharging him directly into the community, which arises sometimes, in which case the test, of course, would be is he likely to be the type of person to commit the offence with which he was charged, because it seems to me you would have to take into account that he was charged with a very serious offence. I believe Dr. Boyd is alluding to the question of fitness to stand trial where the crown attorney has stated that his intention is to try the person, and in such cases I believe Dr. Boyd feels the question of danger or likeliness to commit some dangerous act should not come into the question, that he is entitled to his trial if he is fit to stand trial even though he might be acquitted and even though he might be very dangerous.

Mr. BALDWIN: On this question of the use of the word "insanity", we have raised one possibility of using the word "disability". Assuming that that is not acceptable what about something like the type of wording which was used in the Durham case, something to the effect that the accused, by reason of mental disease or defect lacks substantial capacity to conduct his defence; in other words from a psychiatric point of view or a professional point of view. I am not urging this; I am just asking for information whether that is precise enough to be acceptable.

Mr. SWADRON: That is a possibility. Mind you, having considered the question earlier at this hearing I feel that the British terminology is much to be desired because while it does not define it in the British act—it says whatever would have been a bar to trial—and, as I said before, I believe that the common law criteria are very clear.

Mr. BALDWIN: I agree with you. This is my own view. I am just thinking as to a possible alternative; if this is something which cannot be sold, would this

other wording be the type of wording which might from a medical viewpoint be one which might be clear enough and precise enough to be the subject of an issue.

Mr. SWADRON: I think it is fine. Perhaps the medical men would have something to say on that.

Mr. BALDWIN: That is the reason I was asking Dr. Boyd.

Mr. BOYD: I do not believe it would help particularly; I do not think it would make it any easier than it is now.

Mr. BALDWIN: I have one other question on the matter of the incidence of the number of people who might be detained as being unfit to be tried. Some time ago I read a statement on this and then I had a book which I showed to you this morning. We possibly both agreed that some of the relevancy of some of the statements are not altogether to be approved. This is by Dr. Scasz on psychiatric justice; on page 50 he refers to statistics covering a hospital known as the Matawan State Hospital with approximately 2,000 patients, and the statistics he gives are that of something over 2,000 patients 1,167, or 54.5 per cent had been admitted on the ground that they had descended to such a state of idiocy, imbecility or insanity as to be incapable of understanding the charges against them or of the proceedings or of making his defence. This is an astoundingly large figure; would you think that in one institution in the state of New York that the figure of 1,000 would be a fair appraisal? Of course I suppose you have to take into account what other institutions there may be. I am surprised that more than half the number of people in one institution are confined because they are being declared unfit to stand trial. I am interested to know the nature of the charge. Do you think there are a particularly large number in the United States confined to institutions on that basis?

Mr. SWADRON: That are unfit to stand trial?

Mr. BALDWIN: Yes.

Mr. SWADRON: I would say that there are probably, according to expert authors, far more than there should be. There is a great movement to have more people tried than are now being tried. On the other hand, there is a movement which says that the issue does not arise often enough. A lot of people who are unfit to stand trial are being convicted. It is my personal opinion that as many trials as possible should be carried out as long as it is fair and if the person is unfit to stand trial he is not put in jeopardy of conviction. As many trials as possible should be conducted as soon as possible because it is a fundamental right of an accused person to a speedy trial; I think that that point should be sustained because the longer it is after the occurrence the more difficult it is to conduct a trial.

Mr. BALDWIN: Also to obtain a conviction.

Mr. SWADRON: Yes, it does place the prosecution at a disadvantage.

Mr. AIKEN: Mr. Chairman, I would like to go back to a statement that Dr. Boyd made in connection with some patients who have been in the Ontario hospitals for 30 years who may have been innocent. I would like to rather qualify this to make sure that we do not get the wrong impression. Is it correct

that these people are undoubtedly still under some sort of mental disability, or could they be released if you believed that they had recovered their sanity, if that is the proper word to use?

Mr. BOYD: I am glad you made that point. Yes, we do not have to hold them for years and years after they have recovered. We can recommend that they be returned to court to stand trial at that stage and usually that is fairly prompt procedure. There is also the possibility that the charge may be dropped at that stage. We have had, I think, five on capital charges in the last six years who had recovered sufficiently that we sent back and they were duly found not guilty by reason of insanity. Then, of course, they were sent back to us, although recovered, and then we are able to start the machinery to have a recommendation that the Lieutenant Governor's warrant be lifted. We have five of these now back out in the community who have made a good recovery and are doing well, who had been found not guilty by reason of insanity and who were formerly in our place, most of them as unfit to stand trial.

Mr. AIKEN: But would these people have been detained in any case perhaps in another Ontario hospital even if they had not been suspected or charged with a criminal offense?

Mr. BOYD: I had one man who spent nearly 40 years after recovery and another one who spent approximately 30 years before release. That might have happened anyway, because if they had had their trial initially they might well have been found not guilty by reason of insanity, although I do not think it is actually relevant to this bill. I think it is a problem that is resolving itself. I do not believe I have anybody there now that we think should be either out or back to court.

Mr. AIKEN: Well I wanted to clear this up because of the statement you had people there for 30 years that might have been innocent; the fact is they still have a mental disability which would have retained them in custody in some place.

Mr. BOYD: That is right.

Mr. AIKEN: The question I have is a general one relating to this amendment. You are acquainted with the general amendment being considered, Dr. Boyd; do I take it that you feel this will be of some definite assistance in disposing of cases in a more proper way than they are now handled?

Mr. BOYD: Yes, I do. I am in favour of it in principle. I am not legally trained so I do not know enough about the fine points that you gentlemen will have to argue about to know just which form it ought to take, but I am certainly in favour of it in principle from the point of view for justice for our patients.

Mr. AIKEN: The other question I was going to ask is whether, without restricting yourself to this particular bill, because we in the Committee are certainly not restricted to this bill, is there any other amendment along this line that you can suggest that might be of assistance? This may be a tough question but nevertheless we are considering this and perhaps there is something that has not been covered here that the Committee might recommend to the House for amendment.

Mr. BOYD: I am really afraid to get started on this because it is throwing the door wide open here. I do not know how strictly you want to keep to the terms of reference of this particular bill or whether you want to get involved in the whole subject of mental patients and the law.

Mr. SWADRON: I think that there is one very much related question that I would raise. I mentioned in this outline that there is no provision for a person who has been found unfit to stand trial to get back to court as of right. In other words, the person might be in the mental hospital for many many years and try diligently through counsel or through his family to get back to court to be tried, and there is no procedure for it.

Mr. AIKEN: This does not help it either.

Mr. SWADRON: This bill does not encompass that section or that possibility.

Mr. AIKEN: This is subject to correction by the Chairman of the Committee, but I certainly think that having started on this general subject of the detention or the proper trial of mental persons that we might consider other matters without going too far afield.

Mr. SCOTT (*Danforth*): Mr. Chairman I think we have another bill coming up by Mr. Brewin which opens up the whole field of definitions of insanity and so on and perhaps when that is up Dr. Boyd could come back, and be with us again. He has been a most enjoyable witness.

The CHAIRMAN: That is what has been going through my mind. That the subject matter would be the M'Naghten rules and that Mr. Brewin feels now, if they were out of the bill, it would do away with the rests under The M'Naghten rules, and then substitute another test.

Mr. AIKEN: Well then, Mr. Chairman, perhaps the one point that Mr. Swadron has mentioned is not irrelevant to this bill. I suggest we consider that and perhaps Dr. Boyd and Mr. Swadron might give an opinion on it.

Mr. SWADRON: It is difficult to set forth recommendations as to what the proper course would be. It might be arbitrary to state time limits and intervals during which a person found unfit to stand trial would automatically be brought back to court to re-try the issue, whether or not he is still fit to stand trial.

Mr. AIKEN: Pardon me for interrupting. Are you referring only to the issue of whether or not the person is fit to stand trial?

Mr. SWADRON: Yes.

Mr. AIKEN: So, if we accepted the suggestion you would recommend that there be a provision that a person who is detained because he was found not fit to stand trial should ask to have the issue re-tried.

Mr. SWADRON: Exactly, and as it stands now there is no procedure for it. It is in large part, I believe, up to the hospital superintendent to keep an eye on such a person and recommend, when he feels he is fit to stand trial, that he be returned to court for this purpose.

Mr. MUNRO: Just on that point, is there not a possibility, if this amendment were enacted or an amendment of similar principle were enacted; with regard

to a good many of the men in hospital now that have been found unfit to stand trial a relatively easy administrative procedure could be adopted to have these people brought back to court.

Mr. SWADRON: Well I would certainly say that there would be fewer people sent to hospital who have been unfit to stand trial if this bill would be enacted, because many now sent to hospital might be acquitted during the course of the trial. Certainly the incidence of the problem would decrease.

The CHAIRMAN: Is it not true. Dr. Boyd, that a good many people in your custody think they are much more sane than the people who are not in your custody.

Mr. BOYD: That is right. I think the courts would be pretty busy, or an outside board of committee would be pretty busy. But the present system virtually leaves it up to the superintendent unless some enterprising family issues a writ of habeas corpus and I do not think that with the Lieutenant Governor's warrant they can even do that. There is nothing but the opinion of the superintendent that will get the man back to court and the superintendent may not want to stick his neck out too far.

Mr. RYAN: What you are saying, Dr. Boyd, in effect is that the man in your opinion is no longer certifiably mental. Is that the test?

Mr. BOYD: No, sir. The core of the test is that he is recovered enough mentally that he is now fit to stand trial.

Mr. RYAN: But he would still be certifiable you said, in some areas.

Mr. BOYD: Oh, yes.

The CHAIRMAN: Well gentlemen, I have just got a message that Mr. Gray is waiting for me to present a bill before his committee. I know you would like to carry on. Would either Mr. Aiken, Mr. Scott, Mr. Choquette or Mr. Ryan act as chairman when I leave.

Mr. RYAN: Dr. Boyd, I am trying to get at what your mental processes are in your own case—I am not trying to be too personal in this matter—when it comes to making a recommendation to court; I would also like to know, in the same connection, whether another psychiatrist from the outside can get in to interview a patient to come to his own conclusion or his own opinion about the patient, and can such a psychiatrist consult with you and assist you in coming to a conclusion?

Mr. BOYD: Well, those are good questions. We always allow, and indeed welcome, any outside psychiatrist who would like to come and see any of our patients.

Mr. RYAN: At the instance of a relative?

Mr. BOYD: Yes.

Mr. RYAN: A lawyer?

Mr. BOYD: Yes, a lawyer; there is no problem there. We like to discuss the case with them and in most cases there is no problem. If the man has been certified as mentally ill there is certainly no problem because we are acting on the patient's behalf and if it is in his interest for us to discuss his case with his

lawyer we can certainly do so. There sometimes arises a difficulty when a patient is sent on warrant of remand from a court; we are conducting an investigation for the court and we are going to report back to the court. A defence psychiatrist may turn up at that point and there is some question as to how much communication there can properly be between the psychiatrists that are probably going to end up by being subpoenaed by the Crown and the defence psychiatrist. On my staff at present I have I think five doctors trained in psychiatry and there is usually three or four of these involved in the review of serious cases. It is a joint opinion; we hammer out differences and the opinion that is given to the court is, legally, from the superintendent but it is actually from this conference of psychiatric staff. As far as going to court, I think I myself have been subpoenaed by the defence side more often than I have been subpoenaed by the Crown. We do not mind which side we go on; we do not feel we are taking sides there. But there is that point, that since our report on the warrant of remand is for the court the Crown may not wish to disclose this report to the defence and quite likely the defence will not allow his defence psychiatrists to talk to us. As psychiatrists we would much prefer to get together and work out our differences before we do it up on the witness stand.

Mr. RYAN: You might at one point feel that the patient is no longer certifiable, is quite fit to stand trial, and then the next week have a different opinion. What would you do about a situation of this kind?

Mr. BOYD: Sometimes we estimate how long the trial is likely to last or how long he is going to sit in jail before he gets his trial. He may have to sit for five months in the county jail before he gets his trial and he may be well now, but if we think he cannot stand that there is no sense sending him back for trial. He has to be likely to remain well until the trial is finished. It is rather embarrassing to send a man back for trial, have them start all this machinery in motion and have him break the first day or so and have to come back to us the second time.

Mr. RYAN: What would the average period of clarity be that you would look to in a patient in this condition?

Mr. BOYD: Usually at least three to six months, and sometimes several years, depending upon the history and how much tendency there has been already for the illness to recur. I sent one man back this last year who had eight admissions at least to mental hospital. We thought he would have another attack, but we thought he would stay well until the trial was over, and in those cases we sometimes will arrange to leave the man in hospital until the actual trial arrives and then move him, rather than have him spend two to five months in the county jail.

Mr. MUNRO: Could I just mention, to follow up a matter Mr. Aiken asked about. Dr. Boyd, if these amendments were carried, it is my understanding—I may be incorrect—that many of the people that you presently have at your hospital, many of whom, let us say, have been charged; the issue as to their fitness to stand trial was determined at the commencement of the proceedings, and they were found unfit and referred to your hospital. If the principle embodied here were placed in the amendments and carried into the Criminal Code, then it would be quite possible, would it not, for many of the people you have at your hospital, upon the recommendation of the Attorney General and

the Crown, to be brought back to trial in order that they could obtain the benefit of these amendments. They may have defence counsel now that would wish to make submissions that the issue may be delayed, the determination, in order that evidence could be adduced. With many of the men that you now have in the hospital, who have been incarcerated there, there has been no evidence adduced to substantiate the charge, and they would now have that privilege if these amendments went through, more or less upon an administrative act on the part of the Crown or the Attorney General for Ontario. Am I correct in that understanding?

Mr. BOYD: Well it is a legal question that you have asked me rather than a medical one and I think you people could answer it better than I. I would expect that we would have a lot that could go back. Mind you, there are some people who are so urgently in need of mental hospital treatment that to put them through the trial would not be wise for them; there still needs to be provision to take out of the stream the acutely ill person and get him urgently needed treatment in the mental hospital just as fast as possible.

Now even some of our patients who have been ill 25 or 30 years, while they have never been found guilty or not guilty because of insanity, it has never been proven that they committed the offence; they are still so sick that they obviously need mental hospital care and I do not know that there is any real advantage to trying to get them back to go through this.

Mr. MUNRO: But say for those who would not fall within that category, they would now receive a tangible benefit from the implementation of these principles.

Mr. BOYD: Yes, I think we have a minority of patients who would derive a real benefit from this type of thing.

Mr. AIKEN: Provided, of course, there was a provision—

Mr. MUNRO: No, I am saying without a provision.

Mr. BOYD: That is the legal aspect of it and I really cannot answer the question. Mr. Swadron here could do better.

Mr. SWADRON: Well, notwithstanding that there is no provision for getting back to trial as of right on the part of the accused, certain persons who are held as unfit to stand trial are from time to time sent back to trial, and there is no reason why they could not reap the benefits of these provisions even failing the procedure to send them back as of right on their own application.

Mr. MUNRO: I was rather interested and the only reason I brought this out was there are several cases, one of two of which I have knowledge, that should this amendment go through then it would be anticipated that certain defence counsel and others interested would then make submissions for these people to be brought back. I am thinking particularly in the area of the mentally retarded. As I understand it, Dr. Boyd, and I would like a little emphasis placed on the position of the mentally retarded under the present legislation, it seems to me that the injustice created by the present legislation is most vivid with respect to the mentally retarded who come within the ambit of the present legislation and who, I would think, would receive the most benefit from any type of amendment.

Mr. BOYD: Yes, I think you are right for several reasons. The mentally ill person has a very good chance of recovering in a short time, in which case he can have his trial; or if he does not recover there is a very good chance that he probably should be in the hospital anyway and therefore he is not having any great injustice done. The higher grade of mentally defective is usually capable of living in the community a somewhat sheltered life. Now if he is prone to commit offences resulting from his mental deficiency that will make him certifiable as mentally defective and a proper person to keep in a mental hospital, to prevent him committing offences. On the other hand, the same mental defective or the same level of subnormal intelligence, who has not committed such offences is not certifiable. So they come into the hospital with a charge against them and we are left with the problem that if he did this he should be certified and kept in a mental hospital; if he did not do it he should be returned to the community, and we have to be judge and jury with no evidence. I think that this type of bill would be of greatest protection to that type of person, where they could go on and find out if in fact it is likely that he did commit the offence.

Mr. RYAN: Must a man necessarily have malignant delusions then to be kept in, or is there some other area as well that can render him certifiable?

Mr. BOYD: There are many different areas that can render a man certifiable. He does not need to have delusions at all. He may be depressed to the point of being suicidal; he may be apathetic to the point where he cannot maintain himself in the community; he may be impulsive and dangerous to others without having any delusions whatsoever.

Mr. RYAN: And the man who has benign delusions, who thinks he is Santa Claus or something of that order, I suppose you would not keep him in at all.

Mr. BOYD: There are lots of people who are mentally ill who should not be certified to the mental hospital. As you say, the man with benign delusions, he may be a pleasant asset in the community and no harm to anyone, and if he is suffering from the kind of illness that is not likely to be helped by treatment there would be no reason to put him in a mental hospital; but he is very mentally ill.

Mr. RYAN: While I have the floor, may I go to another subject, doctor. What are the visiting privileges for relatives at Penetanguishene?

Mr. BOYD: They can come any day of the year. We prefer local visitors to come in the afternoon but because of the distances involved and the inconvenience we allow visiting in the evening, week ends, and holidays.

Mr. RYAN: Is there any limitation per week or per month on the number of visits?

Mr. BOYD: No. We might, in a particular case, because it is best for the patient, restrict certain visitors. As I read in the morning report a couple of days ago one of my Italian patients had, I think, 18 visitors that afternoon.

Mr. RYAN: And how long would the average visits be?

Mr. BOYD: Usually several hours. Very often the family will bring a meal and sit down and eat with the patient.

Mr. RYAN: Thank you.

The ACTING CHAIRMAN: Mr. Munro, did you want to ask another question?

Mr. MUNRO: Mr. Chairman, if I may ask a question on mental retardation, doctor. The reason I think there should be something in the evidence concerning this is that there is a fairly high incidence of mentally retarded people in our community and that is one element not exclusively of course that this amendment is designed to assist; I was wondering if you could just give the Committee the benefit of some of the common characteristics that are shared by mentally retarded people. I am thinking in terms of the common characteristics and how suggestive they are; in other words, if somebody should suggest to them concerning the particulars of a certain offence, whether they did it or not and be suggestive in the slightest way that they may have, a confession is easily forthcoming. I would be interested in hearing about characteristics of that kind related to mental retardation.

Mr. BOYD: Yes, that is a very real problem. Many retarded patients are very suggestible and in the police station setting it is not at all difficult to get them to give a confession to an offence that they had nothing to do with at all. I have seen that quite frequently. We had a boy just within the last six weeks who obligingly confessed to a murder and the police did not know where to go from there because they did not think he did it, but he seemed so eager to tell them about it. They did not charge him with it but we do not think he had anything to do with it, but he readily confessed. That type of thing is quite common and, of course, if the police are faced with solving an apathy crime in a community there are probably several defective young men around whom the neighbours are afraid of anyway and who are suspected whenever a crime occurs, so immediately of course the police are going to pick them up for questioning and if they get a confession from them and a charge is laid then at the present time off they go to the mental hospital and that is it. So this bill would be a real protection against that type of thing happening.

Mr. MUNRO: Just one other question, if I may. What is the potentiality of a mentally retarded person along these lines—and by placing this question I in no way want to suggest that they are not capable of an offence involving a sexual act.

Mr. BOYD: I think sexual assaults of violence, it is probably a little bit less than the normal intelligent population; they get led into trouble but by and large defectives do not commit crimes involving much initiative.

Mr. MUNRO: In terms of violence?

Mr. BOYD: Yes. When you think of the number of retarded people that we have living out in the community most of them go through life and never hurt anybody.

The ACTING CHAIRMAN: Are there any other questions? If not, before we recess there are two other items. First, on behalf of the Committee the Chair would like to put on record our appreciation to our colleague from the House for bringing this bill and to the two witnesses who have appeared. I think what you have done is start us off in an area of great concern and complexity regarding the rights of the accused and the administration of justice in that

area. But it has been a most useful session and I hope that as we get further into the subject you might be available on invitation to come back and discuss these matters further with us when we get into the more complex aspects.

There is just one other thing, I have been told we need a motion that reasonable living and travelling expenses be paid to Mr. W. F. Bowker, who appeared before the Committee June 7, 1966, in accordance with the scale of expenses provided by Mr. Speaker.

Mr. RYAN: I will so move.

Mr. BALDWIN: I second the motion.

Mr. Goyer	Mr. McQuaid	Mr. Woolliams—24.
Mr. Grafftey	Mr. Nielsen	
Mr. Guay	Mr. Otto	

(Quorum 10)

Timothy D. Ray,
Clerk of the Committee.

ORDERS OF REFERENCE

WEDNESDAY, October 5, 1966.

Ordered,—That the subject-matter of Private Members' Notice of Motion No. 32, be referred to the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House of Commons.

REPORT TO THE HOUSE

TUESDAY, October 18, 1966.

The Standing Committee on Justice and Legal Affairs has the honour to present its

THIRD REPORT

Your Committee recommends:

- (1) That it be granted permission to adjourn from place to place.
- (2) That it be authorized to sit while the House is sitting when meeting beyond the precincts of Parliament.
- (3) That the Clerk of the Committee and the necessary supporting staff accompany the said Committee.

Respectfully submitted,

A. J. P. CAMERON,
Chairman.

MINUTES OF PROCEEDINGS

TUESDAY, October 18, 1966.

(12)

The Standing Committee on Justice and Legal Affairs met this day at 11:15 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Aiken, Cameron (High Park), Chrétien, Forest, Guay, MacEwan, Mather, McQuaid, Ryan, Tolmie, Woolliams (11).

In attendance: From the Canadian Automobile Association: Mr. Guy Renaud, First Vice-President; Mr. J. G. McQueen, Secretary-General; Mr. E. G. Paul, Director of Traffic and Safety.

The Chairman presented the Third Report of the Subcommittee on Agenda and Procedure which is as follows:

"Your Subcommittee recommends:

1. That Mr. Eugene M. Henry of Warnock-Hersey Ltd., Highway Consultants, be invited to submit a brief re Bill C-26, Bill C-49, Notices of Motion 26 and 31.
2. That a letter from the Motor Vehicle Manufacturers and an attached program of a proposed trip to Detroit at the invitation of the automobile manufacturers be laid before the Committee for discussion and consideration.
3. That Mr. Gordon Taylor, Minister of Highways of Alberta, who acknowledged an invitation to appear before the Committee re Bills C-26 and C-49, be invited to appear at his convenience, early in November.
4. That Mr. Robert E. Malkin be invited to appear before the Committee re Bill C-87.
5. That Mr. Douglas Tracy be invited to submit a brief re Bill C-87.
6. That Mr. A. Bazos be invited to submit a brief re Bill C-87.
7. That Dr. I. M. Rabinovitch be invited to appear before the Committee re Bill C-87.
8. That at the termination of subject-matter consideration of Bills C-26, C-49, C-87, and Notices of Motion 26 and 31, the Committee begin hearing witnesses re Bill C-176.
9. That Messrs. J. G. McQueen, E. G. Paul and Guy Renaud of the Canadian Automobile Association, appear before the Committee on Tuesday, October 18, 1966.
10. That Messrs. Wolochow, Hanna and Bancroft of the Canadian Government Specifications Board be invited to appear before the Committee on Thursday, October 20, 1966."

On motion of Mr. Tolmie, seconded by Mr. Ryan,

Resolved,—That the Third Report of the Subcommittee on Agenda and Procedure be adopted, as read.

On motion of Mr. Woolliams, seconded by Mr. McQuaid,

Resolved,—That reasonable living and travelling expenses be paid to Mr. Robert E. Malkin, who will appear before this Committee Tuesday, October 25, 1966, in accordance with the scale of expenses approved by Mr. Speaker.

The Committee then discussed a proposed trip to Detroit at the invitation of the Motor Vehicle Manufacturers Association.

Agreed,—That the invitation of the Motor Vehicle Manufacturers Association be accepted.

On motion of Mr. Aiken, seconded by Mr. Ryan,

Resolved,—That the Chairman seek the concurrence of the House in the Committee's Third Report. (*For text of Report, see Third Report to the House*)

On motion of Mr. Mather, seconded by Mr. Forest,

Resolved,—That the July 29, 1966 letter of the Association of Canadian Fire Marshals and Fire Commissioners to the Clerk of the Committee, containing a resolution re Bills C-26, C-49, be made an appendix to today's proceedings. (*See Appendix 3*)

The Chairman then introduced Messrs. Guy Renaud, J. G. McQueen and E. G. Paul, of the Canadian Automobile Association who were appearing during the Committee's subject-matter consideration of Bills C-26, C-49, and Notices of Motion 26, 31, 38.

Following a statement by Mr. Guy Renaud, the Committee proceeded to the questioning of the witnesses.

On motion of Mr. Ryan, seconded by Mr. Mather,

Resolved,—That the submission of the Canadian Automobile Association be made an appendix to today's proceedings. (*See Appendix 4*)

At the conclusion of the questioning, the Chairman thanked the officials from the Canadian Automobile Association for their valuable contribution to the Committee proceedings.

The Chairman reminded the members that Messrs. Wolochow, Hanna and Bancroft would be appearing before the Committee on Thursday, October 20, 1966.

At 12:45 p.m., the Committee adjourned to Thursday, October 20, 1966, or to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, October 18, 1966.

● (11.20 a.m.)

The CHAIRMAN: The committee will come to order. The report of the sub-committee reads as follows:

(See Minutes of Proceedings this Issue for text of Subcommittee Report.)

The CHAIRMAN: Will somebody move the adoption of this report.

Mr. TOLMIE: I so move.

Mr. RYAN: I second the motion.

Motion agreed to.

The CHAIRMAN: During the recess Mr. Drury, the Minister of Industry, was in touch with me about a Mr. Robert E. Malkin. Mr. Malkin had a son who was killed in an automobile accident in California. Liquor was involved, not on the part of the son, but on the part of the driver of the automobile. Mr. Malkin has since become a crusader in support of the breathalyzer test and other tests for impaired driving. It was suggested not only by Mr. Drury but the Prime Minister was very anxious that Mr. Malkin appear before the committee. I have been in touch with him, he lives in Vancouver, and I have intimated to him that we would be willing to pay his reasonable living and travelling expenses while he attended before the committee. I have a motion here, if someone will move it:

That reasonable living and travelling expenses be paid to Mr. Robert E. Malkin, who will appear before this committee on Tuesday, October 25th, 1966, in accordance with the scale of expenses approved by Mr. Speaker.

Mr. WOOLLIAMS: I so move.

Mr. McQUAID: I second the motion.

Motion agreed to.

The CHAIRMAN: You have all received a copy of this letter about the trip to Detroit. I hope you have given it your consideration and are prepared to express your viewpoint as to whether or not we should accept this invitation. I may say that this morning, Mr. Bancroft of the Canadian Government Specifications Board was in the secretary's office and he spoke to me, intimating that they had been to Detroit. He felt, from their standpoint at any rate, it was a very worthwhile experience and of great benefit to them. I would be glad to hear discussion on whether or not I should be authorized to accept the invitation.

Mr. WOOLLIAMS: When is that?

The CHAIRMAN: Well, it is tentative. We could arrange the date, I imagine, to suit our own convenience.

Mr. TOLMIE: Mr. Chairman, what dates did you have in mind, sometime during the week?

The CHAIRMAN: It would be during the week, yes, I would think so. I do not think we would want to take a weekend to do it.

Mr. MACEWAN: Perhaps it could be on a Wednesday.

The CHAIRMAN: On a Wednesday, yes. I would like to have a consensus of opinion on whether or not we should take the time. There have been developments. The federal government of the United States have passed a bill about safety devices, and so on. We are going to hear evidence this morning about safety. We have had a considerable volume of evidence on this subject at other meetings of the committee. I am sure it would be a very beneficial trip but it is up to the members to decide whether they would like to go.

Mr. AIKEN: Mr. Chairman, I think this is an excellent idea. We have heard evidence, some of it conflicting, about the efforts that the automobile industry are making towards safety. I think if we go and see for ourselves it will certainly impress us more than listening to a thousand words from several witnesses. I would be in favour of going.

The CHAIRMAN: Any other comments?

Mr. RYAN: Mr. Chairman, I think it would be an excellent thing to do. We could see what developments are taking place and find out what aspects are being considered. What worries me is the intense program which is ahead of us. I do not think we could probably go before the last week in November. I think most members are pretty well tied up. Perhaps we could postpone this for a little while if it were not too imperative to get in a report along these lines.

The CHAIRMAN: The idea, of course, if we decide to go, would be to time it to suit the convenience of the majority of the members of the committee. Mr. Mather, you have some comment?

Mr. MATHER: Yes, Mr. Chairman. I was recalling the background of this. Our steering committee invited different groups to appear and give us the benefit of their information with regard to the material before us. One of the groups invited was the Motor Vehicle Manufacturers Association and they wrote back more or less inviting us instead to go and see the Ford and General Motors testing and research facilities at Detroit. I think that it was sort of a 50-50 proposition. I cannot help but feel from their point of view that it is pretty good public relations to invite people down and show them around a bit. I notice that the invitation is for a two-day visit. I think there is some practical benefit in our going as a group but I feel that perhaps we should give consideration to going for one day rather than a two-day period, if this could be worked out. I think we might gain information which would benefit us, in a shorter time than they indicate. Also, it might save us time here. I think we should go but perhaps for a shorter period than the two days suggested.

Mr. WOOLLIAMS: I think we should go, if we possibly could, for two days. If we go on a Wednesday it is not going to cut into the committee's time because generally there are not too many committees held at the end of that period, at least not on Friday, although we would miss Thursday as a committee day. Because there has been so much criticism of the car manufacturers in reference

to safety, I think we owe it to them to see what they are really doing. I believe that safety is a wonderful thing but I also believe that the human factor, which we are going into in a few minutes, is a very important factor. As a judge once said, it is an amazing thing, with a 66 foot highway, to have two witnesses on opposite sides of the road both saying they were on their own side of the road going in opposite directions at a standstill when they became involved in a head on collision. I would like to go into this with the manufacturers and then we would be able to talk intelligently in the House and in public and I think that would be fair to the manufacturers. At least they have listened to public opinion. They have started on the trend of adding devices to their cars. I think we owe this to them.

The CHAIRMAN: Thank you. Are there any other comments?

Mr. FOREST: Everyone is anxious to go for at least two days in order to have time to see what new safety measures are being developed for the new cars. I think we should leave it to the Chairman to fix a date; presumably a Wednesday and a Thursday within the next few weeks.

The CHAIRMAN: Unless someone wants to express an opinion about not going, motion would be:

That the Chairman seek the concurrence of the House in the following, the Third Report:

Your committee recommends;

- (1) That it be granted permission to adjourn from place to place

Your committee recommends;

- (1) That it be granted permission to adjourn from place to place (2) That it be authorized to sit while the House is sitting when meeting beyond the precincts of Parliament (3) That the Clerk of the Committee and the necessary supporting staff accompany the said committee.

If Mr. Aiken, who was the first spokesman, will move that and Mr. Ryan, who was the second spokesman, will second that. I will put the motion to the meeting.

Mr. AIKEN: I will be glad to so move, Mr. Chairman. The only thing I wonder about is that we are moving out of Canada on this trip. Is there any necessity to mention this or is the motion as drafted sufficient?

The CHAIRMAN: I do not know. We will ask our legal experts, Mr. Woolliams, Mr. Ryan, Mr. Tolmie? We have practically all lawyers here. I do not know whether going to the United States makes any difference.

Mr. MCQUAID: Ask the Clerk.

Mr. RYAN: There is no limitation in the motion?

The CHAIRMAN: There is no limitation in the motion.

Mr. AIKEN: In that case I will be glad to so move.

Mr. RYAN: I second the motion.

Motion agreed to.

The CHAIRMAN: This is a resolution of the Canadian Fire Marshals. They express certain opinions. I am going to suggest that the resolution be made an appendix to today's proceedings if someone will so move?

Mr. MATHER: I so move.

Mr. FOREST: I second it.

That the resolution of the Association of Canadian Fire Marshals be made an appendix to today's proceedings.

Motion agreed to.

The CHAIRMAN: Now, gentlemen, it is my pleasure to introduce to you, first, Mr. Guy Renaud, first vice-president; Mr. J. G. McQueen, secretary-general and Mr. E. G. Paul, director of traffic and safety, all of the Canadian Automobile Association.

You have received the brief and Mr. Renaud is going to be the spokesman for the group and he will be commenting on the brief. When he has concluded the other gentlemen may add something supplementary and they have expressed their willingness to answer questions of members of the committee. Without any further ado I will call on you, Mr. Renaud.

Mr. Guy Renaud (*First Vice-president, Canadian Automobile Association*): Mr. Chairman, members of the Justice and Legal Affairs Committee, the Canadian Automobile Association warmly welcomes this opportunity to present its views on highway safety to your distinguished committee.

I am Guy Renaud, vice-president of the Canadian Automobile Association and it is in this capacity I appear before you today. I am also executive vice-president of the Quebec Automobile Club. Accompanying me are Colonel J. G. McQueen, secretary-general and Mr. Ed Paul, director of traffic and safety of the Canadian Automobile Association, who are here to sustain me and, I hope, field some of your questions.

The Canadian Automobile Association, operating without profit motive, is the association of eight constituent clubs operating 57 offices across Canada. It represents 900,000 private Canadian motorists whose welfare is its main concern. It is unnecessary for us to say that we have a very lively interest in and sympathy with the work of your committee. It is therefore with genuine appreciation that we have noted the work of Mr. Grafftey and Mr. Mather in bringing this subject before our parliament and the people of Canada.

We have placed before this committee a formal submission which I should now like to synopsise and explain. We have also submitted supplementary material to show both the nature of our association and its responsibilities and to provide you with reference material that I hope will help with the committee's studies in this highly important area of road traffic safety.

The letter from our president, Mr. F. D. Jenner, who unfortunately was not able to be present today, tells of our vital interest in highway safety and suggests that we should appreciate your indulgence in broadening our submission to permit an excursion into allied fields.

During the course of its hearings this committee will hear many words and many of them very wise. Possibly there will be opinions on how quickly and painlessly to solve the oppressive problems of highway accidents.

But we in the Canadian Automobile Association do not claim to come up with a magic formula that will solve the present situation overnight. It is our sincere belief that ours is a course of action that will call for the enlistment of

all those willing to serve and prepared to devote a great part of their time to this assignment. To what extent is the motor vehicle responsible for the highway tragedies? This is a factor that we are not in a position to fully evaluate. However, in the United States this subject is receiving a very thorough and undoubtedly beneficial investigation before the House of Representatives. I know that you have this testimony and it will no doubt loom large in your deliberations.

We are fully aware of the complexity of the problem of motor vehicle safety as there are two jurisdictions involved in the standard-making processes, that is, the federal and provincial governments.

There must be the closest possible collaboration between the government of Canada and the provinces if we are to make any standard wholly effective in Canada. It might not be far-fetched to state that the public has a very limited knowledge of what motor vehicle safety standards are. Safety car devices do not only include a collapsible driving wheel or some other device that lessens the severity of body impact in the event of a collision. Other features of an automobile are equally important for its safe operation. The visibility engineered into an automobile is essential. The reliability of all moving parts has a critical bearing upon the safety of a vehicle.

The Canadian Automobile Association at its annual meeting on June 20 last, recognizing that motor vehicles should at all times be maintained in a condition of safety, called upon provincial governments to implement compulsory periodic vehicle inspection tests. It can be said, although the figure is not available, that a very substantial proportion of all motor vehicles in Canada today are in an unsatisfactory state of repair.

Members of the committee will be aware of the work of the Canadian Government Specifications Board and the first draft of this Board's study, which is entitled CGSB 97-GP. This admirable study deals with the three strata of an automotive vehicle safety code. That is, the human factor, the vehicle and the road. The chapter on the vehicle sets forth certain suggested standards for the safety features of Canadian automotive vehicles and the Canadian Automobile Association as a member of this group accepted in principle the recommendations of this chapter. It is probably not necessary, or permitted, that our association comment in detail on the CGSB code. But consideration of the work of the Board and our subsequent action in sending a telegram to the Prime Minister of Canada does emphasize our view that it is difficult to consider the role of the vehicle as an isolated fragment of the entire problem.

We have therefore asked your indulgence and understanding in requesting that the scope of our observations be extended into a considerably broader field than just the vehicle itself. With your permission, Mr. Chairman, I shall proceed into the broader field of this memorandum. Thank you.

The chapter of our submission entitled "Traffic Safety Activities of the Canadian Automobile Association" is self-explanatory. We naturally have a very great interest and involvement in this vexed problem.

In the second chapter we have made some observations on the general topic of highway safety and we have enumerated many subjects within the problem to indicate its complexity and magnitude.

Finally, we have taken the liberty of presenting for the consideration of the committee some observations and recommendations. We have taken what perhaps is the unusual course of suggesting to the committee for study a specific organization to bring about a nation-wide attack on a nation-wide problem. We are aware that this suggestion grossly exceeds our terms of reference but it is our earnest opinion that only by an imaginative and vigorous approach to the problem can we move significantly toward reversing the long-range trend of highway accidents.

In our opinion, at no time in the history of the post-war years since 1945 has public opinion and will been so solidly behind any leadership, such as that suggested, that would cement Canadians toward a common and critical objective of dealing with the crisis of the road.

We have said that virtually every nut and bolt on a motor vehicle has some relationship to safety. It follows that it must be engineered to tie in with the human element of the driver who will operate it. The road over which this human being will drive this motor vehicle should be built with due regard to the speed, weight and frequency of the traffic it must accommodate.

There is a relationship between the geometric design feature of roads and the incidence of accidents, but much more information has yet to be gathered to deal effectively with a new set of requirements for roads. Passing sight distances have a vital bearing upon the safety of highway travel. Sight distances have been changing as the position of drivers has been sinking steadily lower in today's low-slung cars, without any prompting from the highway engineer.

The highway engineer and the mechanical engineer, to meet safety requirements, should consider seriously the performance of high-powered engines and new requirements for road geometrics.

The physical characteristics of drivers and the driving aids and safeguards provided by highway engineering should be considered as one problem. Highway safety can easily be made vastly complicated and it is not the purpose of this submission to compound the confusion of the road, the wheel, the man and now, latterly, the policeman. In brief, it is one of our contentions that all elements should be brought together under one roof. The imperfections in our plan will be apparent. Any attempt to bring together all segments of Canadian society for any purpose whatsoever is difficult.

The Canadian Automobile Association believes in the concept of a national council under whose leadership all highway safety organizations would co-operate. The government of Canada will therefore have to elaborate on the formula whereby such leadership will be provided. The question might well be asked: what of the future of many worthy organizations now active in highway safety activities? There are, indeed, many excellent organizations, federal, provincial and municipal, performing invaluable jobs on behalf of highway safety. It would not be the purpose for a consultative council on highway safety to supersede any of these organizations. Rather, its function will be to strive to enlist their full co-operation by encouraging and stimulating their activities in their particular fields of operation. The total effort of all agencies, public and private, would then be given cohesion and direction and their effectiveness would be substantially extended.

The recommendation is made that there be a council on which federal and provincial government and national associations would be represented. The Canadian Automobile Association is of the opinion that the federal and provincial governments should provide financial support for the council to an extent necessary to discharge its obligations satisfactorily. Representation would be given on the council in the private sector by the election of national associations to membership. Through them industry would be represented in the council's work. An executive committee would be appointed by the council from its membership and the day-to-day activities of the organization would be cared for by the executive committee. A permanent general secretary and a secretariat would work under the direction of the executive committee. The permanent secretariat would be paid and would serve the council, the executive committee and the advisory committee.

May I refer to the tentative organization chart. The membership of these committees, apart from a member of the permanent secretariat, would be recruited from government, industry and associations and would be selected for their special knowledge. The advisory committees would have comprehensive work programs in their respective areas of activity. The suggested areas of course are entirely tentative. These subjects could be changed at will. The advisory committees would originate projects themselves but they also would be directed and instructed by the executive committee and by the council. The advisory committees would bring together existing knowledge on the various aspects of the total problem. They would define what areas of neglect there are and direct the attention of the council to these areas. They would, in turn, suggest action to remedy lack of knowledge. These advisory committees, with the approval of the council, would initiate studies and publications on safety subjects. The central office would establish a library that would be made available for reference by either the general or specialized public. Higher institutes of learning might be encouraged to give courses in some aspects of highway safety.

It will be readily acknowledged that some aspects of this program are now being carried out by existing organizations. There are many areas that need attention; for example, items such as uniform rules of the road, comparison of existing highway traffic legislation, relationship of highway geometrics to the incidence of highway accidents, the special problems of winter safety, and something which is within the present purview of this committee, safety standards for automotive vehicles.

We have listed many subjects that require the attention of the council which we propose, as collected by an authority on the subject of highway safety on page seven of our submission. We believe this will be sufficient to support our contention that there are many problems begging for a solution by some super-national agency.

Mr. Chairman, members of this Committee, we have been bold enough to ask for an extension of our terms of reference before this Committee and we would ask that they be extended to the taking of specific action by the federal authority because we believe the time is most opportune for leadership. We are of the opinion that the federal government has a larger contribution to make to this activity than has been the case hitherto, not only to improve the safety

features of the automotive vehicle but to extend the work it has already begun through the Canadian Government Specifications Board. Thank you.

The CHAIRMAN: Thank you very much, indeed, Mr. Renaud. Now, Mr. McQueen, would you like to make any comments?

Mr. J. G. McQUEEN (*Secretary-General, Canadian Automobile Association*): No, Mr. Chairman, I have nothing to add at the moment.

The CHAIRMAN: Gentlemen, I would like to suggest that the submission by the Canadian Automobile Association be made an appendix to today's proceedings.

Mr. RYAN: I move that the brief submitted by the Canadian Automobile Association be made an appendix to today's proceedings.

Mr. MATHER: I second the motion.

Motion agreed to.

The CHAIRMAN: Now, Mr. Renaud, Mr. McQueen, Mr. Paul, we come to an interesting part of the meeting where members have questions they may wish to ask. I see Mr. Tolmie has his hand up and then Mr. Aiken, and Mr. Ryan.

Mr. TOLMIE: Mr. Chairman, I think all of us realize there is conflicting opinion whether the provincial governments by voluntary agreement could provide a national safety code or whether the federal government should step in and enact a national highway safety code specifying that certain things be built into cars. Now, your brief seems to suggest that the federal government through co-operation with the provinces could, through a council on highway safety, set certain guidelines. My question is: Do you agree? Or, what is your view on the role of the federal government as far as enacting a national code setting out certain specifications for cars is concerned? The second part of my question is: What are your views on the action taken by the United States government with regard to national safety and accident service specifications?

Mr. RENAUD: Perhaps, Mr. McQueen could answer that question, if you do not mind?

Mr. McQUEEN: Well, Mr. Tolmie, first, we have tried in our brief to make this suggested consultative council, not a mandatory body but an organization to work in co-operation with the provinces. We feel, knowing the constitution of our country, that we might get opposition and I am sure you would. I think you read this morning's paper. In the *Globe and Mail* there is an article indicating some reluctance on the part of two or three provincial ministers to the federal government going too far in this field. This made me feel that what we suggest in our brief namely, that it be a matter of co-operation, rather than the federal government drawing up a highway code which I do not think would be acceptable to the provinces, is more feasible.

Mr. TOLMIE: Just for a moment let us assume that these constitutional problems could be overcome and that we could enact a federal code which would force certain safety features to be built into automobiles. Would your association support such a move?

Mr. McQUEEN: Yes, I am sure we would.

Mr. TOLMIE: What I am driving at is the question of guidelines perhaps is a good thought but I do not think it is effective enough. I think that in order to have any effective safety features it would be necessary to have a code with

certain specifications and penalties if these specifications were not incorporated into automobiles.

Mr. McQUEEN: On a nation-wide basis?

Mr. TOLMIE: Yes.

Mr. McQUEEN: Again, we feel that this would have to be done on a consultative basis with the provinces.

Mr. TOLMIE: You agree, apart from the way it is done, that it should be done to be most effective?

Mr. McQUEEN: Yes. It has to be nation-wide. Let me give you an example of what concerns us. At the moment, although I am a native Albertan, I live in Ontario and I will make a right hand turn on a red light. I have been picked up once in Montreal for making a right hand turn without thinking about it. The same applies to signs. The signs are not uniform in all our provinces. This makes it difficult for the traveller. As we all know, today, Canadians are very much travelled people, especially by automobile. I think in the interests of all the motorists of Canada, we must get together on a federal and provincial basis and set up uniformity in all these fields. I was a little disturbed by what I read in the papers. What I read in the *Globe and Mail* this morning confirms our feeling that this must be done on a consultative basis at the present time. I would not like to express my personal view of how it should be done but we were trying to be practical in presenting a solution that we think might work.

Mr. TOLMIE: Just to sum it up so that there is no misunderstanding, my simple point is this. If it is possible, through constitutional means, to enact a national highway traffic safety code, setting out certain specifications with regard to automobiles, would you consider this to be the most effective way to gain your objective?

Mr. McQUEEN: It would be ideal and we think this is necessary.

Mr. TOLMIE: I have just one more point, Mr. Chairman. I realize that now we will be having as standard equipment, dual brake systems, better tires, padded dashes, and collapsible steering wheels. It has always been of some surprise to me that these innovations which now seem so necessary have been so long in coming. I know that public pressure has been instrumental in bringing about many changes. My question is this. Does it mean, now the car manufacturers have started along this road that they will continue to pursue it and introduce more safety features as long as public pressure and government pressure are brought to bear on them.

Mr. McQUEEN: Well, I cannot speak for the motor vehicle manufacturers. I should think, in view of the present trend of public opinion, they will certainly go ahead and do a good job on this. I am sure they must.

Mr. TOLMIE: Do you know if there are more safety features contemplated in the design of cars?

Mr. McQUEEN: Not to my knowledge but you were speaking, Mr. Chairman, of attending at Melford. I had the opportunity of spending two days going through there some months ago. I am very glad to hear you are going because I think you will be most impressed. We also visited the Ford proving ground—this was the automobile association people. I feel quite sure you are going to be impressed with what you see there. It was really a revelation to me.

The CHAIRMAN: You had another question about the United States law, also, did you not?

Mr. TOLMIE: Yes, I am sorry; thank you Mr. Chairman. The United States government has shown some leadership. They have enacted a national code. I was wondering what your association's views were with regard to this particular law?

Mr. McQUEEN: We support it very much, sir. As a matter of fact, the Canadian Automobile Association, as you will see in the back of the brief, is allied and our clubs across Canada are affiliated with the American Automobile Association. I might say the American Automobile Association had a lot to do with bringing about this code. The association worked very closely with the committees of the United States government on this very subject.

Mr. TOLMIE: Your association would be happy if we could enact similar legislation in Canada?

Mr. McQUEEN: Yes, yes we would.

Mr. TOLMIE: Thank you very much.

The CHAIRMAN: Mr. Aiken?

Mr. WOOLLIAMS: I wonder if, before Mr. Aiken begins, I could just ask one question. I do not want to butt in on Mr. Aiken's time but this is as a result of what Mr. Tolmie asked. Do you mind, Gordon?

If I might just digress for a few moments, I am very happy to see you here today Mr. McQueen, since you come from the City of Calgary and I know your work in this field. You raised a point with reference to uniformity. I think in your work you have probably found, certain matters—take the insurance act as an example—this is the main point I am going to make—that it is legislated by the provincial governments but the legislation is uniform across the country because the uniformity principle has been accepted. The provinces got together. Do you not feel from your practical experience, not as a legal or constitutional expert, that it is possible to get a uniform driving code across the nation without much difficulty?

Mr. McQUEEN: Yes, Mr. Chairman, I do. I think you might be aware, Mr. Woolliams, that the Automobile Association is very much involved in urging the provincial governments to accept this reciprocity of insurance with what is known as the pink card. This provided for the acceptance of pink card proof of insurance say, for a man from British Columbia involved in an accident in Ontario. This was established very well indeed.

Mr. WOOLLIAMS: Thank you very much.

Mr. AIKEN: Mr. Chairman, my questions are along the same line as Mr. Tolmie's. Do you see this national body as being a private organization with perhaps government support and assistance or do you see it as being a government body?

Mr. McQUEEN: No. It would not be a private body and it would not be a government body, except we are suggesting as the public does, that the government undertake the secretarial work and the financing. As we say, mutually sustaining with equal powers.

Mr. AIKEN: Preliminary to my next question I would mention that another committee of the house is now considering the transport bill. One of the clauses or sections in that transport bill relates to motor vehicle inter-provincial traffic. While I was present at a briefing on this bill I was informed that the government does not intend, at the moment, to act upon this, but they have included it in the bill in the event that in the future they can reach some kind of agreement. Would you think that perhaps this section 7 of the transport bill might be used now if it were limited to safety measures on the highways without going into the other problems that might arise? It would be strictly on safety.

Mr. McQUEEN: I would have to think about this. I am not too familiar with the transport bill, although I believe it covers all forms of transportation.

Mr. AIKEN: It has one separate part relating to motor vehicle traffic which the federal government, at the moment, does not take any jurisdiction over at all. It has been explained that they are not going to act on it at the moment without provincial consent but that it can be used after consultation. I occurred to me that this might be the vehicle for bringing about the body you suggest, with a national code of some sort for safety measures.

Mr. McQUEEN: Yes, that is possible. I would like to stress again, Mr. Chairman, that we keep using the word consultative and we strongly believe in this. I would repeat that if you read the *Globe and Mail* this morning you will see why we feel so strongly on this consultative point.

Mr. AIKEN: Is there any body now existing in Canada that you think might administer the sort of code you are referring to.

Mr. McQUEEN: Well our suggestion, as you will note in the brief, is that possibly it could be an extension of the work of the Government Specifications Board. The government we feel is the best party to undertake this. There are—I will not name them—as I am sure you are aware, Mr. Aiken, four or five organizations. We belong to three of them. Our own association has its own safety work. We consult and work together with these three or four other groups. They are all on different subjects and we feel it should all be brought under one umbrella. I will name one as an example. You have heard of the Traffic Injury Research Foundation. I happen to be an officer of that organization as a representative from the Canadian Automobile Association. They have a specialized field—the medical aspects of traffic accidents. There is the Canadian Good Roads Association that studies highway engineering, the safe design of roads and so on. We feel all this should be brought under one umbrella, under this consultative council we have suggested with leadership from the federal government and the provincial governments working together.

Mr. AIKEN: You feel then, that it requires more than just a voluntary association of a society such as yourself? You feel it requires legislative action to put some teeth into any regulations that are set up?

Mr. McQUEEN: We feel that the deliberations of such a council would produce proposed legislation which I think would be good for all of us, because what the Good Roads Association might think is good should tie in with the medical aspects or our views or those of the highway council.

Mr. E. G. PAUL (*Director of Traffic and Safety, Canadian Automobile Association*): We should, perhaps, mention that this committee would serve also

to avoid duplication of research. They could make use of research being done not only here in Canada but in the United States and throughout Europe that is applicable to Canada. One car manufacturer, for instance, has recently given a grant of \$10 million to one university in the United States to do certain research. Well, we should be able to make use of that and this committee could correlate all this and also establish a library. It could make use, as Mr. McQueen mentioned, of the Canadian Good Roads Association and the research they do or that done by T.I.R.F. as well.

Mr. McQUEEN: Well, Mr. Aiken, actually to put it in a practical way, all these public service groups that are doing a wonderful job have a lot of information but it is not being brought together. That is the point. It is not being brought together.

Mr. AIKEN: I have just one final question. It is, perhaps, more of a suggestion. I think the most effective group working in Canada right now is the Council of Canadian Resource Ministers which consists of the resource ministers of the federal government and those of all the provinces. I am particularly interested in water resources and pollution. There is to be a national conference, next week, on this subject which it is hoped will result in both federal and provincial legislative action. It seems to me that a council of highway or transport ministers might meet the need that you have in mind.

Mr. McQUEEN: Yes, it could, along those lines. As I say we have put forward these recommendations knowing there may have to be a bit of juggling. But, we do want to stress our feeling that it calls for leadership from the federal government and that it should be permanent. As I understand it, the Canadian Government Specifications Board is a temporary set-up; it is not permanent. We feel there should be something set up on a permanent basis because the situation is not going to improve and we are going to have more and more cars on the road.

Mr. AIKEN: Thank you, Mr. Chairman.

The CHAIRMAN: Mr. Ryan, Mr. Guay and Mr. Mather have indicated they want to ask some questions.

Mr. RYAN: At page 5 of the C.A.A.'s submission, paragraph 2 states that almost 5,000 people died on the highways of Canada; in 1965, 4,894 Canadians. Is it possible to get a breakdown on this? How many were pedestrians? How many would be in motorcycle accidents? How many would involve a car or truck?

Mr. PAUL: Yes sir, that is quite easy to obtain. The Dominion Bureau of Statistics has all these facts and figures.

Mr. RYAN: Could you get them, for the record?

Mr. PAUL: Yes, sir.

Mr. RYAN: Would any of you gentlemen be in a position to advise us, right off, whether the recent increase in motorcycles on our roads, particularly the smaller type of motorcycles, has created an additional menace? Have they brought about any great increase in deaths in accidents?

● (12.10 p.m.)

Mr. PAUL: Well, of course, the increase in motorcycles has been rather unexpected these last three or four years. They are increasing by 100 and 200

per cent per year. This boom in cycling caught everyone unaware and consequently now people are taking a harder look at motorcycles. As you can see from our brief, some of our clubs run motorcycle driver training courses now. They have undertaken driver education for years and now they are getting into motorcycle training as well. There are certain safety features needed on the motorcycle and the driver as well to cut down on the number of incidents of fatal injuries in motorcyclists. I drove one for years and found that if a motorcycle gets involved in a collision with a car there is really going to be only one person hurt and that is the cyclist. The increase in cyclists would increase the fatal statistics given here but we cannot visualize in the future any drop in the popularity of these machines because they are so cheap. They are within the reach of university students and so on.

Mr. RYAN: Do you think, from your recent experience there is cause to feel any great alarm about the situation particularly with respect to motorcycles?

Mr. PAUL: Well, we have not gone into motorcycles on a national basis. It has all been on a provincial basis. Our provincial clubs are promoting provincial legislation. Some of those clubs are quite alarmed at the increase.

Mr. RYAN: But you, as a motoring association, do take motorcycles under your wing, as it were? You are interested in them.

Mr. PAUL: Yes, we are interested for a number of reasons, of course. One is for the protection of our members. If a motorist and a cyclist get involved in a collision the liability is just as great as if two cars were involved.

Mr. RYAN: Or a car and a pedestrian?

Mr. PAUL: Yes, or a car and a pedestrian. We are also involved in pedestrian safety for that reason as well.

Mr. RYAN: Now I found it rather surprising to read at page 6, in the last paragraph, the last three lines:

...nor is there a cohesive system yet available in Canada for the exchange of highway accident data.

Mr. PAUL: Well, really there is not. In the *Globe and Mail* this morning, there were comments about uniformity in police reporting across Canada. This leads me to believe that you can submit one type of report in one province and go to the next province and submit another one. I do know, where there has been an accident and a person complained he was injured but refused to go to hospital, that some police forces still put him down as an injured person in their report. In other areas, if a person refused medical attention at a hospital or if the injuries are not of a certain seriousness, according to the medical profession, then he is not put down as an injured person.

Mr. RYAN: It would seem to me that it is of intense interest to us, and to everybody in this country, that we have standardized accident reporting so that we can properly assess what we are up against.

Mr. PAUL: Well, of course, there again it has been a provincial responsibility.

Mr. McQUEEN: Mr. Chairman, I would add to that. At our last pedestrian program judging, one of the judges was Chief Adrian Robert of the Quebec Provincial Police. He asked us if we would take this up with the Dominion Bureau of Statistics and we have made representations to them now to try and

call a conference of all provincial authorities to establish a uniform accident report form. This is receiving consideration at the moment.

Mr. RYAN: Have you, as an association, ever tried to bring this information into a central file? Have you ever tried to perform that service?

Mr. McQUEEN: No, we have not. That is really a professional statistician's job and, as I mentioned to you, we have been in close consultation with D. B. S. on this subject. I understand there is a possibility of a conference being held in the not too distant future. It would bring all police authorities and motor vehicle administrators across the country together and seek agreement to this common form.

Mr. RYAN: Has there ever been any attempt to bring about a standardized form?

Mr. McQUEEN: This is an attempt by them, sir.

Mr. RYAN: This is the first? Would you have this in mind as one activity of the consultative council you propose?

Mr. McQUEEN: Yes.

Mr. RYAN: This would be one of their activities?

Mr. McQUEEN: This would be one of their activities.

Mr. RYAN: You do not think it would be better to have it under the aegis of the Department of Industry's Specifications Board, for example. I believe that board is considering setting up a code for the whole of Canada with respect to automobile construction and design?

Mr. McQUEEN: Yes.

Mr. RYAN: Would this type of thing tie in if that were to come to pass?

Mr. McQUEEN: This is a task which we see as part of the consultative council. This would be one of its tasks. I think if you look at the chart on page 17, sir, you will find we have covered most of those subjects.

Mr. RYAN: Would you prefer to see this council avoid duplication of research?

Mr. McQUEEN: Yes.

Mr. RYAN: Or would you prefer to see that undertaken by the federal government's board?

Mr. McQUEEN: Frankly, in our thinking, we see the Specifications Board as part of this council, or, in fact, as we state in the brief, an enlargement of the Specifications Board could form the council. It would be an extension of their responsibilities and would provide continuity.

The CHAIRMAN: Mr. Guay?

● (12.17 p.m.)

(Translation)

Mr. GUAY: First of all, I entirely approve of the efforts which have been made to increase road safety. However, what is most important of all is reducing the number of accidents.

Mr. RENAUD: What we seek above all is the education of the public in respect of road security and at every possible level in society. In fact, almost all of our clubs have a system which they call the school patrol system, as well as

the education of young people at the high school level, that is driving instructions. And then, we have the pedestrian protection plan whose purpose is to help municipalities to improve their protection service for those people coming under them.

This is the basis of our safety program. However, there is not only education. We also have the application of the law itself. We have attempted to reach some uniformity wherever possible, such as highway engineering and car safety. In our mind, all this, however, is based on the education of the people, we have to make them security conscious.

Mr. GUAY: However, Mr. Renaud, I believe there is a certain amount of confusion. You would like a single highway code. A consultative council should be set up in this country according to you?

Mr. RENAUD: Yes, we should have under one roof all interested parties, those parties who have any interest at all in road security, road safety. There are various aspects of course to this matter, but that which is of particular concern to us is highway safety, but there are others that are related matters.

Mr. GUAY: But what is the most important factor of all, according to you? What is the—

Mr. RENAUD: Personally I feel that the human element is the determining factor as far as accidents are concerned. For instance, if we have a badly engineered highway, if we have a road which is not built according to rigid safety specifications, here again, you have causes of accidents, but, generally speaking, the human element, as far as I can see is largely responsible.

Mr. GUAY: That is why I was putting that question, because I wanted to relate it to another aspect of the matter. In any case of fatal or near fatal accidents, does your association always look for the real cause? Do you really look for the actual reason of the accident? We have all kinds of accidents where people are killed or not killed, but where sometimes we merely have physical damage, but sometimes we really don't know what the cause was.

Mr. RENAUD: That is what we are thinking about. We are suggesting the setting up of a national road safety organization. We would look for the causes of car accidents. There is a great deal of information available which is there, available to us, but which is not interpreted however, and which is made no use of because there is no actual organization competent to look into it.

Mr. GUAY: There are a large number of accidents which are unexplainable when the car turns over, for instance, or sometimes when a car runs into another. Sometimes we have really no damage involved, but in those cases, should not the municipal government look for the actual cause of the accident. Should they not push the investigation a little further in order to determine the actual cause? Because, this being the case, I think we could have statistics and we could be working on something which is actually more concrete and draw conclusions from that and do what is necessary.

Mr. RENAUD: That is why the safety organization at the national level would have a very useful role to play because we would be there bringing under the same roof, all these organizations concerning highway safety.

Mr. GUAY: Do you believe that by centralizing this—and I have reference here, to what the *Globe and Mail* says this morning—do you think that by centralizing all these powers—all this research, that is—do you think that we will be able to go to some remote part of a county, or of some little parish where we had a little accident, do you think that will be better done than if it came under the provincial government, which is not so far away, and which could coordinate that research more easily.

(English)

Mr. PAUL: Mr. Guay, perhaps I could answer that question. It is difficult for municipal governments to train adequate personnel to thoroughly investigate automobile accidents. Police personnel go out to the scene of an accident and they just report the obvious things, what witnesses there are and so on. They do not have the professional mechanics to go out and tear the car apart sort of thing. We are suggesting that this committee would have either teams of personnel to investigate this or perhaps initiate research on an area basis.

Every accident does not have to be investigated so thoroughly. You can get a general idea of what has taken place just by investigating 500 out of 10,000 accidents. Half of these accidents occur on a gravel road where a car for no reason goes off the gravel road and upturns. The driver says that another car blinded him with headlights. But, with teams to investigate these accidents it could really be determined whether it was a tie-rod end that was weak, a tire that was deficient or any of these things. But the municipal governments could not possibly investigate them thoroughly enough to give any one a real opinion as to what had actually occurred. It has to be, basically, federal leadership in this particular field of research and correlating all this research. Much has been done throughout the world by professionals investigating automobile accidents quite thoroughly. This committee could gather all this information and correlate it. I have, in my experience, investigated many, many accidents. I was on what they refer to as "on call" for fatal accidents for years. Every time there was an accident within the Corporation of the City of Ottawa and a policeman thought a person was going to die, I was called out. We put a little more effort into it if we thought it was going to be a fatal accident. It was not with the thought in mind that we were going to determine what the real cause of the accident was. It was with the thought in mind that we would be prepared in case of criminal charges or civil charges, so we would not be embarrassed as policemen in front of the courts. How can you ask a little town with one or two police officers to have them to be so highly trained that they can by themselves determine the actual cause of an accident.

(Translation)

Mr. GUAY: How do you explain that nothing at all has been done; we hear figures quoted here and there, but are there teams already set up in any province whatever, to determine what action there is to take when we have, for instance, fatal accidents; do people go on the spot, do people examine the car? Is this done in certain zones or in certain areas in this country or is there nothing done at all?

(English)

Mr. PAUL: Well, to my knowledge, sir, there is very little done. If there is any of it done, it is just done on a local basis by some organization that will go out and investigate one or two thoroughly. If I may just mention a point in case. Where there is an automobile in a collision with a fixed object, a tree or a post, with no witnesses, then the policeman arriving at the scene of the accident has to take the person's word for what occurred, if any people are alive. But, for instance, if he looks at the skidmark and there are X number feet of skidmark and that indicates to him that something else has occurred then he might call out an expert. But, where do you get the expert? In Ottawa we are particularly fortunate that we have the R.C.M.P. lab here. They have experts. But, how about Three Rivers? How about Manotick? So many accidents go by the board where it is obvious that it is something other than what the person says but then there is no thorough investigation into it. Some provinces are setting up police schools where policemen are sent down to be, what they consider, highly trained. They are highly trained in police work and police work is all-inclusive with Criminal Code, highway traffic accidents, by-laws and so on. So, how highly trained can you expect these people to be. Their education standards are such that they do not have degrees and are not capable of absorbing all this. We think that this committee we are suggesting can do all this. It could compile all this information and tell us whether the accident occurred because of the geometrics of the road, or perhaps the driver's attitude, or for medical reasons. T.I.R.F. could perhaps tell us if it was medical. In the Government Specifications Board report, T.I.R.F. points out a little thing that probably will amaze every committee member here, that is, a person who smokes three cigarettes while driving with the windows of his car closed is the same as being at an altitude of 7,500 feet. That amazed me when I read it too. But a group of experts told us this and, consequently, I make sure that my car windows are open all the time.

● (12.30 p.m.)

Mr. McQUEEN: Mr. Guay, on that subject—and this might be of interest to you—I was fortunate enough to be in England last month and I discovered that in the Birmingham area they have set up an investigating team just as an experiment. For every accident within a 50-mile radius they send for the coroner, a police officer and an engineer. They are compiling statistics for this group because this is an experiment. I might suggest that if this consultative council were formed they could finance and operate a group which could be sent to a certain part of the country to carry out such experiments, because our roads are all the same and our people all drive the same. This might be another idea. I think the Birmingham idea in England is excellent. So, they were thinking along your lines too.

Mr. PAUL: I might add just one further thing. No one incident causes an accident; there is always more than one, perhaps two, three or four. Perhaps a man had a dirty windshield and his vision was restricted or he was over-driving his headlights with a dirty windshield; now, there are two incidents that might have caused an accident. Perhaps he had had a couple of drinks, or three.

(Translation)

Mr. GUAY: One last question to answer a question I asked a while ago. You said a moment ago that in certain municipalities we have only one or two constables who would be able to inspect the scene of the accident. But following each of these accidents, what we will be able to note is that we have an insurance company or two insurance companies who send their adjusters. They are involved in this. These insurance adjusters appear to be competent. Could they not make a more detailed report and look more closely into the actual cause of the accident?

(English)

Mr. PAUL: Well, sir, yes, insurance companies do but for a selfish interest, perhaps, and they may not look as far as we would possibly like them to. They are in a competitive field. Now this consultative committee could make use of this type of information, yes, but I do not think we could leave it up to insurance companies to tell us what the causes of accidents are. They are as interested in safety as we are by their activities in safety and by supporting the different safety organizations. No sir, I do not believe that we could. What we are suggesting is that this consultative committee be formed and they have this information available. Then this information goes out and Chief Tom Jones of the little town gets this information and says, well now, this might be the answer and we will do this or we will do that and so on.

The CHAIRMAN: We have passed the hour for adjournment and Mr. Mather indicated he has some questions. Perhaps Mr. MacEwan has some as well. Probably we could continue.

Mr. MATHER: Mr. Chairman, my question will take perhaps a minute and with the co-operation of the committee I would like to ask it. I was going to say that it would seem pretty clear to me that whatever the cause highway slaughter does not recognize any boundaries, whether they are municipal or provincial. I think the toll from highway accidents is increasing in line with the increased mobility of Canadians, whether they live in British Columbia or Prince Edward Island or wherever it is. The last figures I have indicate that we are killing people, or they are being killed now, at the rate of about 100 persons a week in Canada on the highways or in traffic accidents, and I think something in the order of 3,000 a week are being injured. I believe the total financial toll is over \$600 million a year. This is going to increase with the number of people driving cars and the more leisure time we have, unless something is done to correct it.

I felt that the C.A.A. had made a very good presentation and I think the main point they make is this one asking for consideration for the establishment of a consultative council of all concerned to meet this problem. They called it a National Consultative Council, it might be called a Canada Consultative Council, if that would make acceptance easier in different parts of the country. The fact that we are meeting, as we are here, and discussing this, or that the federal government has a Government Specifications Board, and the inter-provincial meeting is taking place today, all shows that there is a recognition of the need to do something. My question is, has the proposal of the C.A.A. on the consultative council already been made to the federal or provincial authorities. If so, has there been a response to the proposal or, if it has not been made, is it

being made to our committee with the thought that we would take it into consideration in any report we make to Parliament.

Mr. McQUEEN: Yes, Mr. Mather. This is our first presentation. As you will see in the brief, we submitted in broad outline the hint, if you want to call it that, to the Prime Minister in our telegram. This was our opportunity, we felt, to get it into the federal government channels. Now those of you who are familiar with our association are aware that all our provincial associations will be supporting this and of course we will be advising the various provincial governments that this is our stand.

Mr. MacEWAN: I think most of the questions have been answered regarding this proposed council. I would just like to ask to whom a report would be made by this council? Would an annual report go from the council to the federal government as well as the provincial governments, or just to whom would a report be made?

Mr. McQUEEN: Well the report would be made to all levels of government because they are all part of it—all members, you might say, and the members would be the federal government, the provincial government and possibly five or six national associations involved in this work. They would all have parts. We would all sustain each other.

Mr. MacEWAN: I think Mr. Tolmie led off asking whether a national safety code would be the thing. Of course, this step you are proposing would be an initial step to be carried out. It would be a move made by the federal government through the Canadian Government Specifications Board. Of course your hope is that at some time a national code could be effected.

Mr. McQUEEN: We feel this is the only practical way that this can come about in view of our constitution because, as I say, we are all part of this, the federal government, the provincial government and the industry represented through these five organizations. I feel that is the only way we would ever get agreement to set up such a thing as a national safety code.

Mr. MacEWAN: With this council, of course, the reports you would make to the various levels of government plus the other organizations in the country, would include the various areas to be covered, as outlined on page 17; education, medical, road construction and so on. I take it that there would be nothing mandatory in these suggestions by the council but, in most cases, it would be up to the Department of Highways and the governments of the various provinces to effect these suggestions.

Mr. McQUEEN: Yes. I think we point out that it would not be mandatory. It would be to collate, research and to make the information available to the various jurisdictions, the provinces and what have you, and through this council it might be the solution to get agreement between provincial governments and the federal government on the question of setting up the example you point out, a national highway code which we think, in this case, is absolutely vital to all of us as Canadians.

Mr. MacEWAN: Mr. Chairman, Mr. Paul was mentioning a traffic expert. A definition that is sometimes used is that an expert is a man from out of town. I do not suppose that is a correct one. That is all I had to say sir, thank you.

The CHAIRMAN: Mr. Forest?

● (12.42 p.m.)

(Translation)

Mr. FOREST: Just one question. According to your brief, your recommendation is to set up this consultative council with federal representatives, representatives from the provincial governments and representatives from other organizations involved. This is a very good solution, but that might be a very long term one. Before this thing is set up, I think we might have to wait for a little while. What are the immediate steps suggested by your association in order to attempt to correct the present situation? For instance, would your association favor federal control exercised through legislation to establish standards for the improvement or the manufacture or the importation of cars such as proposed by Bills 26 and 49? Would you support such legislation? Or legislation of another type which could be applied in the short run?

Mr. RENAUD: Certainly, because any measure designed to improve safety is per se, good. However, there is another aspect. As you probably read in this morning's *Globe and Mail*, the provinces have realized the need for having a certain uniformity in highway legislation. These are all various aspects of the same question.

Mr. FOREST: But the federal government's responsibility will be to see that this would be applied throughout Canada.

Mr. RENAUD: Yes, the federal government should concentrate all the strength of the provinces and of the various organizations involved to realize something concrete in the field of highway safety.

Mr. FOREST: Are you in favor of immediate legislation to impose specifications, safety specifications on car makers?

Mr. RENAUD: Certainly.

(English)

The CHAIRMAN: Gentlemen, I think that probably concludes the questioning and nothing remains but for me to thank you, Mr. Renaud, Mr. McQueen and Mr. Paul for your presentation this morning. You must have gathered from the numerous and very searching questions that were asked that the committee are very much interested in your brief and on behalf of the committee I want to thank you most sincerely for your presentation and for your appearance here this morning.

Mr. RENAUD: We want to thank you, Mr. Chairman, as well as members of the committee, for having given us this important day to appear before you.

The CHAIRMAN: May I mention, before we adjourn, that Messrs. Wolochow, Hanna and Bancroft of the Canadian Government Specifications Board will appear before the committee on Thursday of this week at 11 o'clock. May I say that we have arranged with Mr. Deachman that we sit regularly at 11 o'clock. I thought that would probably be most convenient for members. If there is no further business then the meeting is adjourned.

Appendix 3

ASSOCIATION OF CANADIAN FIRE MARSHALS & FIRE COMMISSIONERS

July 29, 1966

Clerk of Justice and Legal Affairs Committee,
Committee Branch,
House of Commons,
OTTAWA, Ontario.

Dear Sir,

At the 1966 Annual Conference of the Association of Canadian Fire Marshals and Fire Commissioners held in Vancouver, B.C., June 27-July 1, the following resolution was passed with respect to fire safety in highway travel and in automobiles. Our association has requested me to direct this resolution to the Justice Committee of the House of Commons and it would be appreciated if you would bring it to the attention of the Chairman, Mr. A. J. P. Cameron, M.P., for such action as he and the Committee deem advisable.

WHEREAS: The matter of automobile safety on the highways, and in the construction of automobiles, is of National concern and currently under study by Committee of the Dominion Government, and

WHEREAS: Fire safety in highway travel and in automobiles is of concern to the general public and all governments, and

WHEREAS: Standard automobiles without deluxe features are constructed and supplied with only one ashtray in the driver compartment, and

WHEREAS: Many fires are caused by carelessly discarded cigarettes and matches, and

WHEREAS: It is an offence in most of the Provinces and Municipalities to throw any burning substances from any moving or stationary vehicle.

THEREFORE BE IT RESOLVED: That the Association of Canadian Fire Marshals and Fire Commissioners petition the Committee concerned with automobile safety to include in mandatory requirements that all new automobiles sold in the Dominion of Canada be equipped with ashtrays to a minimum of two (2) ashtrays in each driver and passenger compartment, as in the case of sedans.

If you will apprise me of such action as may be taken by the Justice Committee on this matter I will make this known to the members of the Association of Canadian Fire Marshals and Fire Commissioners.

Yours truly,

D. E. Barrett,
Secretary-Treasurer,
Association of Canadian Fire Marshals
and Fire Commissioners.

Appendix 4

SUBMISSION
to the
STANDING COMMITTEE
on
JUSTICE AND LEGAL AFFAIRS
of the
HOUSE OF COMMONS
by the
CANADIAN AUTOMOBILE ASSOCIATION

October 18, 1966
Ottawa, Ontario

**TRAFFIC SAFETY ACTIVITIES OF THE
CANADIAN AUTOMOBILE ASSOCIATION**

The Canadian Automobile Association was established in 1913 and, for more than half a century, has been the voice of the private motorist in Canada.

Eight constituent clubs of the association maintain 57 offices in Canada and serve a membership of 900,000.

The Clubs of the Association provide a wide range of services with which the Members of the Justice and Legal Affairs Committee will be familiar. Perhaps not quite so well known, however, is the wide range of activities conducted by the CAA Clubs relating to highway safety.

Each constituent club has a program of promoting sound highway legislation, much of which involves specific traffic safety recommendations and safeguards. The legislative programs of the provincial associations are co-ordinated through the 13-man Policies & Resolutions Committee of the national office. Throughout the more than half-century they have been in existence, the clubs have advanced recommendations to provincial legislatures that have benefited not only their members but the motoring public at large.

The automobile clubs began initially as a motoring service principally to repair the faltering internal combustion engine and to guide motorists to their destinations along the primitive paths of the early century. In fact, many clubs erected road signs, largely guide signs, for the benefit of their members and fellow motorists.

Roads and the automobile population grew briskly during the 20's and exploded with phenomenal force during the post-World War II period. Unfortunately, the growth of traffic accidents showed commensurate increase.

The clubs of the Canadian Automobile Association moved individually, and collectively, during this period to protect the lives and properties of the motorist.

These programs are largely self-explanatory:

Driver Training Courses:

These courses are for the teen-age driver and the adult driver. In co-operation with other agencies, CAA turns out qualified instructors to teach Driver Training Courses.

"Sportsmanlike Driving"

The CAA has made available a Canadian Edition of a standard textbook on Driver Training Practices and Procedures.

Planned Pedestrian Program

CAA is the only organization in Canada with a program devoted specifically to protecting the pedestrian. An independent board of judges evaluates municipal safety programs, traffic engineering and law enforcement as applicable to the pedestrian. Assessments made by the CAA secretariat and board of judges analyze municipal safety programs, make public awards for merit and make these confidential assessments available to municipalities, from which they may pattern their future pedestrian safety programs.

School Safety Patrols

With the firm conviction that safety habits and attitudes begin at an early age, the CAA clubs sponsor School Safety Patrols. The clubs foster the movement through training and provide equipment and supplies to the Patrols. Each year, CAA sponsors a National Jamboree in Ottawa with delegates present from across the entire nation.

Highway Safety Research

The CAA clubs encourage research on highway safety, including support of and co-operation with the Traffic Injury Research Foundation. One constituent club this year underwrote the cost of research of breathalyzer testing.

Motorcycle-Driving Training

Because of the growing problems associated with the operation of motorcycles, the Canadian Automobile Association clubs, in some instances, are offering training courses for motorcyclists.

Emergency Services on Highways

The CAA constituent club in Toronto operates a system of telephone call boxes along the high-speed freeways of Metropolitan Toronto which enables the stranded motorist to obtain emergency services immediately and thus minimize the perils of collision.

In addition, many CAA clubs operate road patrols providing emergency assistance where needed to any motorist.

Community Safety Programs

The CAA constituent clubs co-operate with any worthy form of regional or community traffic safety activity. They lend their support to municipal and provincial safety clubs in the deep conviction that there cannot be too many people and agencies concerned with and active in the highway safety field.

The Canadian Automobile Association enjoys a very wide range of connections with organizations in Canada engaged in the same general areas of highways and highway transportation. It also has formal affiliations with many similar associations abroad.

THE PROHIBITIVE PRICE OF MOBILITY IN THE CANADIAN COMMUNITY

During the past score years, safety organizations have sought to impress upon the minds and hearts of men the spiralling price for mobility on the road. But the price in dead, property loss and anguish continues to rise. There is, understandably, much that is emotional. So frequently the facts are not related to objective criteria.

But the simple fact remains that 4,894 Canadians died on the highways in 1965. The fact requires little other explanation. Any such drain on human resources is a problem of national magnitude and requires positive and vigorous leadership and co-operation of all segments of the Canadian community, public and private.

There is not one iota of doubt that with leadership and concerted action, the tide of highway losses can be reversed; and substantially.

No reasoning person can accept the premise that the price we now pay, in human lives and property damage, for motorized transportation is irreducible.

Highway safety organizations have developed, and now widely use, three basic divisions for an attack on highway safety:

Education

Inculcating sound attitudes in young and old alike to the dynamics of automotive vehicle transportation creates a respect for the dangerous potentialities in the modern automobile and inevitably results in fewer accidents. High school driver education courses have demonstrated their value in teaching the young to drive carefully.

The re-training and re-testing of licensed drivers also has had encouraging results. Human error in undoubtedly the major cause of highway accidents and education is a key to moulding human beings to safe driving.

Engineering

A number of individual engineering areas relate to highway safety; the characteristics of roads are known to influence the incidence of accidents on any specified stretch of road or street. Traffic control devices, signs, signals, markings influence the rate of accidents. But the precise relationship between the geometric factors, such as sight dis-

tances, curves, widths of shoulders, lighting, channelization, curvatures, crosswalks, controlled access, has yet to be fully developed by highway scientists. Despite the elaborate protection provided on today's freeways, accident rates remain too high. A great deal more research needs to be undertaken on the relationship of highway design to highway accidents.

Enforcement

Many enforcement officers contend, and with good cause, that this is the most encouraging avenue along which to approach means of reducing highway accidents. This section is one of the most contentious and yet one of the most promising fields in which vigorous action is essential.

While it can be stated that much of the research that has been done on highway accidents is inadequate and sketchy, a considerable amount of useful and useable data is now being made available to Canadian administrators and safety practitioners. But it is doubtful if this information is also being made available to the many factions involved in highway safety, nor is there a cohesive system yet available in Canada for the exchange of highway accident data.

The nearest that administrators have come to establishment of a priority rating for action comes informally from Alberta's Minister of Highways, Hon. Gordon E. Taylor, last year's President of the Canadian Good Roads Association.

Mr. Taylor asked 30 traffic specialists to rate priority action to be taken to cope with traffic accidents. Among the group were vehicle administrators, traffic engineers and police officers, equally divided. The replies were as follows:

- Stricter enforcement of traffic laws;
- Higher standards of competence by all persons involved in highway departments, traffic functions, police, judiciary, transport departments;
- Driver re-examination;
- More safety features incorporated into automobile design;
- Make existing drivers' licence tests stiffer;
- Compulsory vehicle inspection;
- Increased public education in safety;
- Improved highway design standards;
- Uniform traffic signs, signals, markings, lighting;
- Increased research in safety;
- Uniform motor vehicle traffic laws;
- Improved legislation on drunk and impaired driving;
- Driver education in schools;
- Build more freeways;
- Uniform pedestrian code;
- Improved co-operation among all bodies involved in traffic safety (police, highway departments, judiciary, etc.);
- Restrict teen-age drivers;
- Maintain detailed cross-index files on all drivers in the nation;
- Separate all pedestrian traffic from automobile traffic by overpasses, fences, sidewalks, etc.;

- Eliminate all two-way roads and streets;
- Eliminate all on-street parking;
- Eliminate all railway level crossings;
- Improve snow and ice control;
- Create a national safety organization to advise, investigate, publicize all safety matters;
- Separate all roads and streets;
- Improve highway traffic legislation;
- Restrict use of roads and streets by highway trucks;
- Change present speed limits.

After reviewing all the suggestions made by these capable and experienced gentlemen, one can come to the conclusion that there is no royal road to safety and that there is great, and largely unfulfilled, need to bring together and co-ordinate many safety activities throughout Canada.

On the specific item before the Committee—safety features that could be installed in a vehicle—there is much to be heard and studied. A number of devices and adaptations of present design could be considered. It is worth noting that this subject has been extensively reviewed at considerable breadth and depth in the United States. Of possible immediate concern, as related to the vehicle, is some review of restraining devices, forward compartment energy absorption, energy absorbing steering control system, dual operation of brake systems, tire and safety rims.

OBSERVATIONS AND RECOMMENDATIONS

The Canadian Automobile Association is of the opinion that highway safety today is so diverse a problem, so fragmented and involves so many different organizations, public and private, that there is a critical need now for a central organization which would bring together all these agencies in co-operative effort.

In a telegram on June 22, 1966, to the Prime Minister of Canada, the annual meeting of the Canadian Automobile Association asked that the federal government take leadership in bringing about this co-operative approach as follows:

“In the full knowledge that highway transportation is primarily a provincial jurisdiction, it is submitted that the Government of Canada should extend its activities in its preparation of a set of guide-lines of highway safety by the convening of a conference of the federal and provincial jurisdiction, it is submitted that the Government of Canada establishment of a body that would provide the basis for the activities of governments in this highly important area.

“It is suggested that the Government of Canada might be expected to invite not only provincial representatives but representatives of national and major provincial agencies with an interest and concern in highway safety.

“The urgency of this matter is great and Canada must take action to meet one of its major social, economic and humanitarian problems.”

The Canadian Automobile Association now submits, for the consideration of the Justice and Legal Affairs Committee, a proposal to create a "Consultative Council on Highway Safety," with the following objectives:

- (a) To encourage comprehensive programs of highway safety by all worthy agencies, public and private, operating in this field;
- (b) To assist and fortify by all means possible, including technical and financial assistance, provincial and municipal safety programs;
- (c) To bring about the greatest possible collaboration and mutual assistance of all highway safety agencies;
- (d) To serve as a clearing house for all information on safety research and education;
- (e) To make available to all agencies the results of highway safety research in Canada and from countries abroad.

The "Consultative Council on Highway Safety" should be completely independent of any government, association or industry but mutually sustained by all. It should be emphatically stressed by this submission that it is not envisaged that there would be any disruption in the activities of any organization presently actively engaged in some phase of highway safety. Rather, it is the intention that existing activities would be greatly encouraged and supported. It might be considered that where a safety group presently exists in one aspect of safety, such as the Traffic Injury Research Foundation with the medical aspects of highway safety; or the Canadian Good Roads Association with the construction and maintenance of roads, these bodies might be invited to provide the works program and guidance for their own special activity.

PREAMBLE

WHEREAS the loss of life and property on Canadian streets is a major national problem involving all agencies, public and private, and all individuals;

WHEREAS the problem of highway safety in Canada is so fragmented that there is a serious overlapping and lack of co-ordination among all agencies and individuals involved;

WHEREAS there is urgent need for vigorous leadership by the federal government in bringing into concerted action all the varied agencies and forces involved in highway safety;

RESOLVED that the Government of Canada convene a meeting, in the immediate future, to consider the creation of a central agency, to be named the Consultative Council on Highway Safety, around which all Canadian highway safety activities could revolve.

It is suggested that the federal government provide the secretariat for a preparatory committee to plan the meeting and that the federal government consider assigning this task to the Canadian Government Specifications Board. The following draft constitution is submitted that it might serve as a basis for the proposed Council.

ARTICLE 1

A Council to be named the "Consultative Council on Highway Safety" to be established by a meeting convened by the Government of Canada.

ARTICLE 2

The aims and objectives of the Council shall be:

- (a) To encourage comprehensive programs of highway safety of all worthy agencies, public and private, operating in this field;
- (b) To assist and fortify by all means possible, including technical and financial assistance, provincial, municipal and private safety programs;
- (c) To bring about the greatest possible collaboration and mutual assistance to all highway safety agencies;
- (d) To serve as a clearing house for all information on safety research and education;
- (e) To make available to all agencies the results of highway safety research in Canada and from countries abroad and, where necessary, encourage and underwrite highway safety research and education in Canada.

ARTICLE 3

The headquarters of the Council should be located in Ottawa.

ARTICLE 4

The Council shall be composed of representatives of governments, federal and provincial, existing national associations with an interest in some aspect of highway safety. The composition of the Council should be suggested by a Preparatory Committee brought together by the Government of Canada. This preparatory group also would establish terms for eligibility in Council membership. Representatives would normally serve for a three-year period but provision should be made to elect one-third of the total membership of the Council every year. One-third of the members of the Council shall constitute a quorum.

ARTICLE 5

The powers and duties of the Council shall be to:

- (a) Elect its chairman and two vice-chairmen;
- (b) Elect members to the Council;
- (c) Appoint an Executive Committee of (number to be determined) members;
- (d) Act upon all matters referred to it by the Executive Committee;
- (e) Determine its own rules of procedure and establish such subsidiary bodies as it may consider necessary or desirable;
- (f) Vote an annual budget;
- (g) Refer to the Executive Committee, to subsidiary bodies, or to any other body, any matter within its jurisdiction;
- (h) Delegate to the Executive Committee the powers and authority necessary or desirable for the discharge of the duties of the Council:
 - (i) amend the provisions of the Constitution;
 - (ii) deal with any matters within the jurisdiction of the Council not specifically assigned to the Executive Committee.

ARTICLE 6

The Executive Committee shall be responsible to the Consultative Council. It shall be composed of (number to be determined) members appointed by the Board. They shall serve without remuneration but shall have all expenses paid when on Committee work. (Number to be determined) of the Committee members shall represent provincial governments; (number to be determined) the federal government) (number to be determined) shall represent national associations with an interest in highway safety and one will be a member-at-large, appointed because of his or her interest and involvement in the subject of highway safety. The Council shall initially appoint (number to be determined) members for a three-year term, (number to be determined) for a two-year term and (number to be determined) for a one-year term. Each year thereafter, (number to be determined) members shall be appointed for a three-year term to replace the (number to be determined) retiring members. (Number to be determined) members shall constitute a quorum. The Committee shall elect annually a chairman and one or more vice-chairmen.

ARTICLE 7

The Executive Committee shall:

- (a) Submit an annual report to the Consultative Council, including the activities of all ancillary groups;
- (b) Carry out directions of the Council;
- (c) Appoint Advisory Committees and ancillary groups and define their duties;
- (d) Appoint a chief executive officer who shall be called the General Secretary and who shall implement the directions and instructions of the Committee;
- (e) Prepare and submit to the annual meeting of the Consultative Committee an annual budget, annual statements of accounts, etc.;
- (f) Direct the program of the organization through the Advisory Committees and Secretariat of the collection, study, collation, analysis and dissemination of information on highway traffic safety;
- (g) Make any arrangements deemed necessary or desirable to fulfill the aims and objectives of the Council.

ARTICLE 8

Advisory Committees shall be appointed to the Council on the advice of the Executive Committee and Secretary.

These Advisory Committees shall initially be on:

1. Education, Driver Training, Examination, Re-Examination and Licensing;
2. Medical Aspects of Highway Safety;
3. Road Construction and Maintenance;
4. Traffic Law Enforcement;
5. Traffic Engineering;
6. Automotive Vehicles;
7. Highway Traffic Legislation.

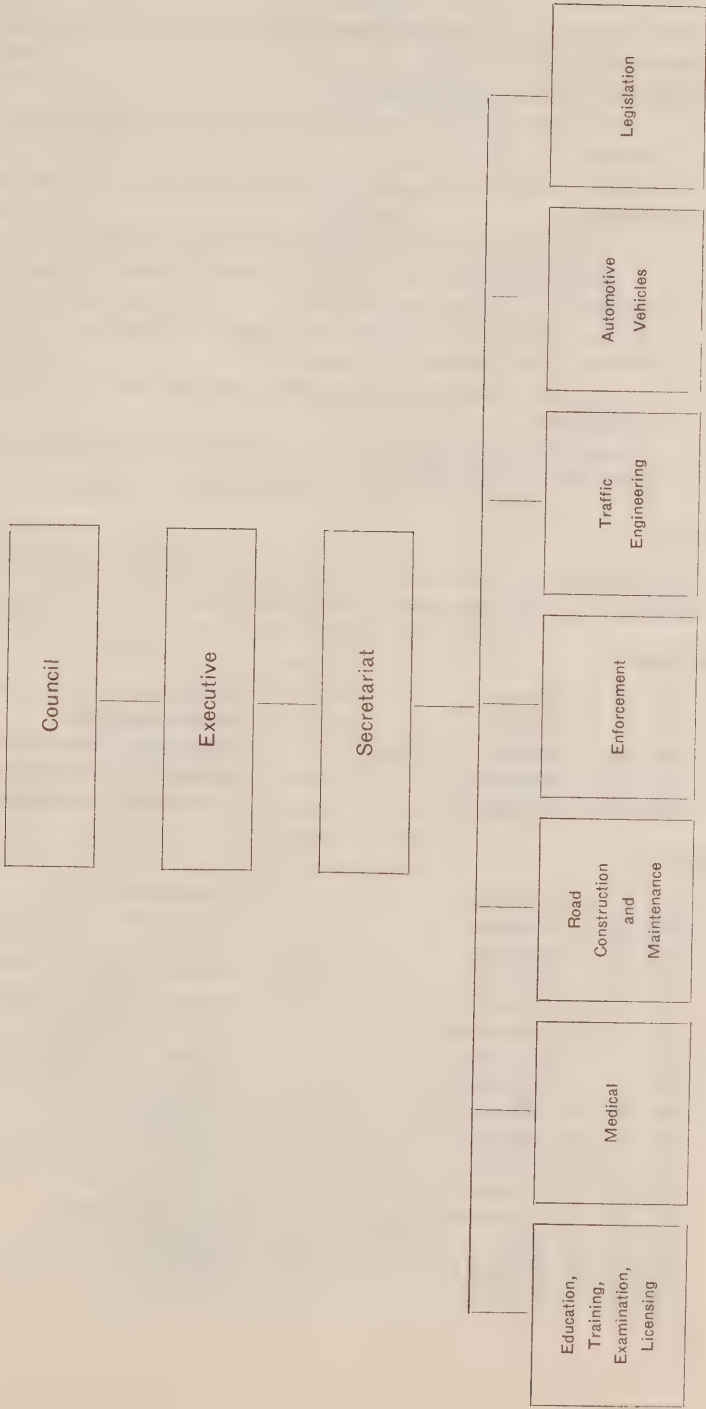

ARTICLE 9

The Advisory Committees will undertake all responsibilities referred to them by the Executive Committee. Members will be recruited from government and industry and shall be chosen on the basis of their knowledge of the special subject matter for which they are made responsible. The size of the Advisory Committees will be left to the discretion of the Executive Committee. The Committees will elect their own chairmen and vice-chairmen, if desired. A permanent secretary of the Committee will be assigned to the Advisory Committees by the Secretariat. He will be paid by the Council. Members will serve without remuneration but will receive travelling and living expenses from the Council. Meetings will be at the call of the chair at a convenient geographic location. Annual reports will be made by the Advisory Committees to the Executive Committee and upon matters referred to them by the Executive Committee.

ARTICLE 10

The General Secretary shall act as permanent non-voting secretary of the Consultative Council and non-voting secretary-treasurer of the Executive Committee. He shall advise the committees on technical, administrative and financial matters. He shall be responsible for the works program of the Executive Committee and shall direct the permanent Secretariat which will serve as the permanent secretaries of the Advisory Committees. He shall establish and maintain liaison with members and other organizations interested in highway safety research and education in Canada and abroad. He shall provide all services required for the efficient operation of all bodies within the structure of the Council. He shall be appointed by the Council for a two-year term.

SUGGESTED STRUCTURE
of the
CONSULTATIVE COUNCIL ON HIGHWAY SAFETY

OBJECTS OF THE CAA

The Canadian Automobile Association is the federation of all the non-profit automobile clubs in Canada.

The objectives of the CAA are:

To further the interests of the motorists generally throughout Canada.

To maintain the rights and privileges of those who use motor vehicles.

To promote rational legislation governing the use of such vehicles.

To assist in and encourage the maintenance of good roads throughout Canada.

To advocate a reasonable regard on the part of motorists for the rights of others using the highways.

To undertake and promote publications in the interests of the Association.

To do all such things as are incidental or otherwise germane to the attainment of the above objectives.

PATRON

Timothy D. Ray,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

THURSDAY, October 20, 1966.

(13)

The Standing Committee on Justice and Legal Affairs having been duly called to meet at 9:30 o'clock a.m., the following members were present: Messrs. Cameron (*High Park*), Forest, Goyer, Guay, Mather.

There being no quorum, the Chairman adjourned the meeting until 11:00 a.m. the same day.

(14)

The Standing Committee on Justice and Legal Affairs met this day at 11:30 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Aiken, Cameron (*High Park*), Chrétien, Forest, Goyer, Guay, Latulippe, Mather, McQuaid, Ryan, Tolmie (11).

In attendance: From the Department of Defence Production, Canadian Government Specifications Board: Mr. D. Wolochow, Secretary; Mr. J. Bancroft, consultant with D.D.P. on Committee on Traffic Safety; and Mr. J. E. Hanna, Committee Secretary.

The Chairman introduced Mr. D. Wolochow, Mr. J. Bancroft and Mr. J. E. Hanna of the Canadian Government Specifications Board.

Mr. D. Wolochow then made a brief statement, after which the Committee proceeded to the questioning of the witnesses.

At the request of the Chairman, Mr. Wolochow passed around to the members a draft copy of a guide on factors of automobile safety.

On motion of Mr. Mather, seconded by Mr. Tolmie,

Resolved,—That the C.G.S.B. draft Standards re automobiles, 97-GP-1 through 97-GP-27, be appended to today's proceedings (*See Appendix 5*), and that the draft guide on factors of automobile safety be appended to today's proceedings (*See Appendix 6*).

At the conclusion of the questioning, the Chairman thanked the witnesses for their valuable contribution to the Committee proceedings.

On motion of Mr. Forest, seconded by Mr. McQuaid,

Resolved,—That the Committee pay an account in the amount of \$25.00 for copies of the British "Road Safety Bill" received from the British Information Services.

At 12:50 p.m., the Committee adjourned to Tuesday, October 25, 1966, or to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

THURSDAY, October 20, 1966.

The CHAIRMAN: Gentlemen, we have a quorum and while we are in the solicitous state that we are I think we should commence.

I have the pleasure, gentlemen, of introducing to you Mr. D. Wolochow, Mr. J. E. Hanna and Mr. J. A. Bancroft. Mr. Wolochow is the Secretary and Mr. Hanna is the Committee Secretary of the Canadian Government Specifications Board. Mr. Bancroft is the Consultant with D.D.P. on Committee on Traffic Safety. As you will all recall, when the Minister was here last May he gave us an outline of what the Specifications Board has been doing. You all have a copy of this pink document in your possession.

Now, gentleman, if you will sit down we will proceed in the way you want. Perhaps you would give us a preliminary statement, and then the members could question you on it as well as on any other matter.

Mr. D. WOLOCHOW (*Secretary, Canadian Government Specifications Board*): Thank you, Mr. Chairman. I am glad you mentioned, sir, that the Minister had been here before this committee on May 27, at which time he gave you the background of the work that the Canadian Government Specifications Board was doing in the field of traffic safety. Since that time we have made some progress and we were able to supply the committee with copies of 27 draft standards covering safety devices that anyone who wishes may include in automotive vehicles. These draft standards are now before the Canadian Government Specifications Board for formal ratification and if we encounter no obstacles within the next few days with the board, which has the authority for final approval of any standards published by the Canadian Government Specifications Board, then we will issue these early next month.

I regret very much, Mr. Chairman, that we have not had time to prepare French translations of these standards. Officially, we must start the translations only after our board approves them which, of course, we hope will be very shortly.

The CHAIRMAN: Could you let us have copies then?

Mr. WOLOCHOW: We will let you have copies just as soon as we can get them.

Mr. GOYER: Did you say that the arrangements for translation can only be made after the approval of the board? Are the working papers not translated in the department?

Mr. WOLOCHOW: It is not our practice to translate from one language to the other while we are working on it.

Mr. GOYER: Even though you may have to appear as a witness before the Committee?

Mr. WOLOCHOW: We did not really have sufficient notice. We did not know that we were going to appear until just a few days ago.

Mr. GOYER: But is it the policy of the department, when an official of the department has to come as a witness, not to have his documents in both languages?

Mr. WOLOCHOW: If it is at all possible we try to have them, but time just did not permit.

Mr. GOYER: But if you have time, it is your policy?

Mr. WOLOCHOW: That is right. Now, in the interim we have also been working on a guide to traffic safety, copies of which we have not been able to submit because the guide has not yet been approved by our committee; we hope it will be very shortly, and as soon as the draft has been approved by our committee we will be very happy to provide the Committee with copies.

The CHAIRMAN: We can count on that, then?

Mr. WOLOCHOW: Yes sir, you may be sure that we will have them just as soon as possible. As soon as the committee has given final approval to the draft guide we will have copies for you. If it may be of interest, sir, this guide will comprise three parts: one part dealing with the human factor; the second dealing with the mechanical factor, and the third part dealing with the environmental factor, which is mostly the road. It will be merely a guide—a collection of the best information we have on the relationship of these three factors to the traffic safety problem, in the hope that this compilation of information made available to the Canadian public will help in some small way to improve the traffic situation on our highways.

The CHAIRMAN: Mr. Hanna, do you want to add anything?

Mr. J. E. HANNA (*Committee Secretary, Canadian Government Specifications Board*): No, I do not think it is necessary for me to supplement this at the moment, sir.

The CHAIRMAN: Mr. Bancroft?

Mr. BANCROFT (*Consultant with D.D.P. on Committee on Traffic Safety*): No sir.

The CHAIRMAN: Gentlemen, the meeting is open for questions, and I see Mr. Mather has his hand up, and then Mr. Tolmie.

Mr. MATHER: In line with what we have heard, and also in line with what I recall the Minister saying before, I think I am right in saying that the standards which this specifications board are setting are simply educational or informative. There is no way for their mandatory adoption on any section of the community.

Mr. WOLOCHOW: I should perhaps emphasize, Mr. Chairman, that there are actually two parts to our work. One part consists of the standards per se, the 27 standards describing the devices. They are made available to Canadians who may want to use them in purchasing these items for their vehicles. So far as the government is concerned, I think the Minister did indicate in his testimony last May that the government has already committed itself to the policy of equipping its own vehicles with these items just as quickly as feasible. Otherwise, they are available for anyone who wants to use them. Now, the guide is not a standard; it is merely information. They are two separate things; those which

we will publish next month and the guides which we hope to publish before the end of the year.

Mr. MATHER: Then although there is no mandatory basis for the adoption or establishment of these standard devices, the federal government may set an example to the country by adopting what has been established as safety devices in its own vehicles?

Mr. WOLOCHOW: We hope that the government will set an example.

Mr. MATHER: I am one of those who regrets very much that it is impossible, apparently constitutionally so far, that what you are doing is not going to be put into some legislation, but rather used for educational purposes.

Mr. WOLOCHOW: So far as Canada is concerned, I do not think there is any legal or constitutional reason they cannot be published by the proper authorities.

Mr. HONEY: You just want them published?

Mr. WOLOCHOW: Perhaps I should have said, "made mandatory".

Mr. RYAN: Do you see any reason why there could not be a federal code for federal vehicles, let us say. Could that not be?

Mr. WOLOCHOW: For federal?

Mr. RYAN: Yes.

Mr. WOLOCHOW: Well, the government has already committed itself to implement these standards for its own vehicles.

Mr. RYAN: Would there be no legislation?

Mr. WOLOCHOW: Well, that I do not know.

Mr. RYAN: It is just a matter of practice, is it?

Mr. WOLOCHOW: I suppose that is up to the legislature.

Mr. RYAN: Well, you would know whether it is under consideration, would you not?

Mr. WOLOCHOW: Well, the whole matter is under consideration.

Mr. MATHER: I think you said, sir, that you saw no reason for the devices standards not being made mandatory by the proper authority. What would that proper authority be?

Mr. WOLOCHOW: That is something that the government is trying to establish in consultation with the provinces.

The CHAIRMAN: It would appear to be a committee of the ten provinces.

Mr. TOLMIE: I have two questions, Mr. Chairman, and I want to follow along with the line of questioning just advanced. I think all of us are aware that there is a potential constitutional problem which would prevent the federal government, perhaps, from enacting a national safety code incorporating these specifications. You do not have to answer the question, because I know you do not set government policy, but what are your views in this matter. Do you think it would be most beneficial to have the federal government enact a national safety code similar to the American one, which would make it mandatory to have these safety devices incorporated in a vehicle? What is your considered opinion?

Mr. WOLOCHOW: First of all, Mr. Chairman, we should realize the situation in this country is not exactly the same as it is in the United States with respect

to the relation between the federal government and the individual states. Apart from that, certainly some standards would be very useful. The question of who should make the law is now under consideration, and I think that anything that can be done to promote safety certainly would be useful.

Mr. TOLMIE: I do not want to tie you down on this, but what I am trying to get across is that everybody seems to think we have to do a lot about safety; but I am of the opinion—and I think, as well, perhaps certain other members of the Committee—that in order to make these effective they have to be mandatory. Guidelines are good; they are examples, but they are not that effective. I gathered from your evidence that at the present time of course there are difficulties, but that you would feel that to be most effective they should be mandatory and incorporated into law, whether it is done by the federal government or the provincial government, or in cooperation with both.

Mr. WOLOCHOW: Shall we put it this way, sir, that the federal government has seen fit to make these mandatory upon itself, so I suppose that is an indication of what the federal government thinks about this.

Mr. TOLMIE: I should not pursue this line of questioning because I realize it is government policy. There is one other question I would like to ask. This list of specifications is very comprehensive; there are 27 standards, I believe. Now, I know the public are accepting this trend to more and more safety devices. The thought has occurred to me—and I have not really had time to develop it to any great extent—that as we increase the number of safety devices in cars, there is a danger that drivers of cars will feel so protected, so secure, that their standard of care may diminish?

Mr. WOLOCHOW: I think, sir, that is something that could be debated. I really do not know the answer. We can't prophesy what the public reaction will be, hoping that this will not happen, and hoping that these devices will add to the safety.

Mr. TOLMIE: We are all hoping that, but I am just wondering if any research has gone into the particular aspect—it is psychological, I know—of whether there is not a real great danger that the objectives to be obtained by incorporating standards may be offset by an increasing lack of care on the part of the driver because of this feeling of security. I am just wondering if any research has gone on in that aspect?

Mr. WOLOCHOW: Could we take an example of the seat belts. When seat belts were first suggested, I think that question was raised. Some people thought if the seat belts were really as good as the proponents say it is and will make driving so much safer, people will become more reckless. They will drive faster and take more chances. I think that experience has shown that this is not the case. What statistics we do have, indicate that the seat belts have been very useful in diminishing a number of fatalities in certain types of accidents and the seriousness of the injury.

Mr. TOLMIE: And you would hope the same reasoning would apply.

Mr. WOLOCHOW: Yes.

Mr. TOLMIE: I have one other short question. What is the safety feature of the standard gear quadrant; what is the purpose of that.

Mr. HANNA: I think the answer to this is that more and more people are driving cars other than their own, rental cars and so on. There have been

accidents caused by people getting into a car and assuming that the quadrant was as they had been used to, putting it in reverse when they expected to go forward or what have you. So, having a standard sequence for these is important. Also in that standard, we have removed the reverse and forward motions by a detent and the neutral positions, so you cannot accidentally get into going the wrong direction.

I would like to comment on the previous question if I might, Mr. Chairman, on the psychological effects of the safety devices. I think with some people they may have the effect that you mentioned. I think with other people, they will have the other effect, that they will be a reminder of the fact they are in a dangerous situation and they will, therefore, be more careful. I think this particularly applies to seat belts. This is a very obvious reminder that you are in a hazardous situation, and I think, just as many people will be affected one way as the other on this thing.

Mr. TOLMIE: I understand also that certain manufacturers of tires have shown some concern about the safety of the tire itself. Do you have any comments on that?

Mr. HANNA: I am not quite sure, but I think most of the tire manufacturers have been concerned with the public concern on tire safety and I think that we have something in our standards on this relating the capacity of the tire to the capacity of the vehicle, which is very important. Also in the non-quantitative part of the guide we have commented on this and have given some information which may be of use to the owner of the car on inflation, capacities and so on.

Mr. TOLMIE: Thank you.

The CHAIRMAN: Mr. Guay, you are next.

(Translation)

Mr. GUAY: Has this draft guide been already given to the provinces? To the ten provinces?

(English)

Mr. WOLOCHOW: Mr. Chairman, the standards and our guides have been produced by a committee on which all the provinces are represented. We have had two meetings of the full committee; we have had two meetings of the subcommittees, and at all of these the provinces have been represented. They have this information; we are working very closely with the provinces, and even after these documents have been published we hope to continue working with the provinces until this whole problem between the federal and provincial governments can be solved.

(Translation)

Mr. GUAY: Mr. Secretary, you say that you are working in close cooperation with the provinces, but what happened last week in Toronto during Road Safety Conference? The Federal Government was not even represented there, I think. Would it not that have been proper for the Federal Government to be invited to this?

(English)

Mr. WOLOCHOW: That is a very proper question but perhaps it should be addressed to the provinces. As I say, I still confirm that we are working very closely with the provinces; we have very friendly relations with them; they have been most co-operative and they are certainly interested, and although we have certain differences of opinion once in awhile, to date we have been able to work very harmoniously with them.

As to the meeting in Toronto, I believe that question was raised in the House of Commons and an answer was given. I may only supplement it by saying that I think it is perfectly normal for certain organizations to have their own meetings. We have certain meetings among ourselves, and I think if the provinces decided that at this particular juncture they would prefer to have their own meetings and there certainly is not very much we could do about it. We knew about the meeting, and perhaps we had some subconscious feeling that we should be there, but the fact remains that the provinces decided to have a closed meeting, and while they gave a statement to the press we were not invited. But we are meeting with them all the time and are continuing our consultations, and we certainly have no quarrel on the ground that they decided at this particular juncture to have an exchange of views amongst themselves. I think just like in any family, members of the family might have small differences of opinion and they do not want to discuss those before an outside party.

(Translation)

Mr. GUAY: But during the discussions that you mentioned, you said that you had your own meetings. But were all the provinces represented at these meetings? Has there been any question of making these standards mandatory? How can we have uniform standards all over the country if there is, not just mere co-operation, but actual application of these recommendations? I think they are putting the cart before the horse.

(English)

Mr. WOLOCHOW: Let me put it this way. At the outset, over a year ago, when it was decided to undertake this project, we wrote to the 10 provinces; they all accepted our invitation to come and at a meeting in June the 10 provinces were represented. At the second meeting we had earlier this month, unfortunately, one of the provinces could not be represented. At the committee meetings, it was agreed by the whole committee that the subcommittee meetings would only include those people who were within commuting distance from Ottawa, for example Quebec and Ontario—Manitoba—would come to the subcommittee meetings.

All the members and the provinces are sent copies of the minutes and we are now continuing our discussions with them (provinces) on particular subjects. So far as my reference to our own meetings are concerned, we do have working meetings of our secretariat, where we have discussions as to how to proceed on certain matters, and I do not think anyone would suggest that we always make these formal meetings. To get work done on a specific subject, you have to really prune it down to a working group. But decisions on what goes in here and in our guide, of course, are made at the meetings.

So far as making the standards mandatory is concerned, certainly this has been discussed at the meetings, but I do not think our committee could make such a decision. We are hoping that before too long the provincial governments—after these have been issued and made available—will perhaps decide on what their approach to mandatory legislation should be. In the meantime, the federal government is studying its own position, as to whether there is a jurisdiction there because, as you know, in the B.N.A. Act the federal government does have jurisdiction in certain interprovincial and international matters. If it can be resolved on that basis, that might be a very happy solution to it. This certainly is definitely under consideration. Either a request will come from the provincial side or a recommendation will come from our committee. It will be resolved in that way.

● (11.50 a.m.)

(Translation)

Mr. GUAY: One last question, Mr. Secretary. Is it possible to instal on older vehicles these 27 standard devices, whether they be in the transmission, headlights, steering? Is it possible to include those—

(English)

Mr. WOLOCHOW: I am going to give a partial answer to that and then ask either Mr. Hanna or Mr. Bancroft to supplement it.

I think if you look through your list of items it is obvious that some of them can be readily installed, others would involve quite a more serious operation, and economics would dictate whether you are going to instal a dual brake system or whether you are going to take your car in and get a new one that has this as standard equipment. I do not know whether you wish to add anything to this, Mr. Hanna.

Mr. HANNA: I think that is a very good answer and I think that the example which Mr. Wolochow has taken is a good one.

A dual brake system could be put on an existing car but it would be rather an expensive proposition. Quite a few of the items, such as outside mirrors, and so on, could be put on easily; padded dash, fairly easily; energy absorbing steering column, with great difficulty.

(Translation)

Mr. GUAY: Does this mean then, that if the standards became obligatory, they would apply only on new cars?

(English)

Mr. WOLOCHOW: It means, Mr. Chairman, that this is largely a question of economics and the fact that this is a very large industry we are dealing with. They have mass production and they must be given time to put some of these things into the vehicle. I think if these standards ever become mandatory we would have to adopt the principle that is being followed in the United States, under which the motor industry is given lead time for some of these items. In other words, if it is something that can only be put into new cars, then you have to give them a chance to change over their production line so they can put them on. In the United States they have definitely established schedules for certain times. This year a certain item will become mandatory, next year another, and

so on. But as the industry gains experience with these things the likelihood is that the lead time may be reduced. I do not know. In any event, we have to face this very serious economic problem.

The CHAIRMAN: Mr. Ryan, Mr. Forest and then Mr. Goyer.

Mr. RYAN: Mr. Chairman, I would like to ask a question, first with respect to standard 97-GP-23 and later to 97-GP-24. Twenty-three deals with side marker devices and I was wondering why the forward side marker should be coloured from white to amber and the rear ones red only. Why is there an option on the forward side marker?

Mr. BANCROFT: Mr. Chairman, the reason the white to amber was included is because of European imports.

Mr. RYAN: Is there any time limit envisaged to change this standard and reduce it to either white or amber? Which would we prefer here, white or amber?

Mr. BANCROFT: It is our policy as in all our standards to revise them and keep them up to date with technological progress and developments in the industry. As soon as it becomes appropriate and advisable to make changes in these standards, they will be amended. Of course, we have all the scope in the world to change these as long as they are voluntary. If they ever become law then, of course, the due process of law will have to be considered.

Mr. RYAN: This is one area where there likely would be a change come to pass very shortly.

Mr. WOLOCHOW: There is nothing here that is final. As there are changes and our thinking indicates we will make improvements, we will make them if we can.

Mr. RYAN: Yes, certainly.

Mr. HANNA: I think this is an area also in which ophthalmologists are in some conflict as to the virtue of amber as a colour for use in designating parts of a car. Some feel that this is useful and others feel that it may be confusing. At the moment we are faced with both being in existence and with no clear evidence as to which way we should go. I think that the decision we have in here is appropriate.

Mr. RYAN: You say both are in existence. I do not recall seeing any existing car in Canada with—

Mr. HANNA: You are correct. I think the new Renault has this. Very frequently this is done by extending the signal light around the corner and, as you know, most of the American cars have amber front signal lights now.

Mr. RYAN: Yes.

Mr. HANNA: If these are extended around the corner it forms a side marker device as well.

Mr. RYAN: Is there going to be any confusion with truck lighting with these side markers? Trucks have more side lights than passenger cars. There just does not seem to be very many for passenger cars at the present time.

Mr. HANNA: I think the purpose of this is to make cars look more like trucks, in the night situation, so that they can be seen from the side. Trucks normally have enough lights on them so they can be seen from the side, but cars may not. I suppose in this way we are increasing confusion in an unimportant way to get more definition in a very important way.

Mr. RYAN: Did you want to say something, on that, Mr. Bancroft?

Mr. BANCROFT: Mr. Chairman, the amber aspect of this, as Mr. Hanna has stated, is in the hands of the ophthalmologists and this rather dictates as to what we place in any of our standards from the experts' point of view. Perhaps we should investigate the experts before we make a decision. I happen to drive a European car that has amber markers on the sides. There is sufficient evidence on accidents to indicate the problems which are encountered because of the lateral position of an automobile in relation to traffic. We would like to have the headlights white, we feel this has greater penetration, and the amber would then be recognized as the side marker. I have to go to the United States here, this is in line with the Interstate Commerce Commission, where the front marker light plan started.

Mr. RYAN: I think this is an excellent standard, there is no question about that particularly in our country where we have cars spinning on ice, and this sort of thing, and I am all in favour of it.

I would like to go on to the next standard, 97-GP-24, which appears to specify roll bars for light trucks only, trucks up to 10,000 pounds. I wonder why no standard was brought in for passenger vehicles other than convertibles?

Mr. BANCROFT: Mr. Chairman, this standard applies to light trucks of utility type up to 10,000 pounds with open bodies and enclosures made of canvas, aluminum or fibreglass. We are dealing here with government purchase of this type of automobile and we have not gone into the passenger car field. The reason for this is that we have ample evidence from various studies that the sedan-type passenger car will withstand reasonable roll-over and has fairly good roll-over characteristics, if I may put it this way, so long as it is within a normal roll-over situation. What I mean by normal roll-over situation is that it drives off the road and rolls over. However should this vehicle encounter an obstacle in its performance of rolling, then there is some doubt whether the present automobile would withstand such an intrusion into the passenger compartment. But normally, from statistics we have the majority of roll-overs, the standard type sedan roof will support the car in a roll-over sufficiently that intrusion on the passenger compartment will not be fatal.

Mr. RYAN: Your standard, as it is specified here, would it be better than the average passenger car? In other words, if a light truck hit a tree would the bar be better in a roll-over, or would it just give the equivalent of the present strength of the roof of a passenger car?

Mr. HANNA: I think, Mr. Chairman, that this would give less protection. This would merely keep the driver's head from coming in contact with the road, but he does not have any protection against being thrown out or things coming in on him.

Mr. RYAN: This applies to the cab as well as to the rear of the vehicle?

Mr. HANNA: This is essentially for a cabless vehicle.

Mr. RYAN: A cabless vehicle?

Mr. HANNA: Where you just put up some sort of a canvas windbreak, or what have you.

Mr. RYAN: I understand.

The CHAIRMAN: Mr. Forest?

Mr. FOREST: When the minister appeared here last May I believe he asked the Government Specifications Board to prepare a complete security code for motor vehicles for the use of government, industry and the public. Is this part of it or are you preparing it now?

Mr. WOLOCHOW: Well, as I pointed out to you earlier, Mr. Chairman, actually our work will have two end results. There will be these standards, which will be issued separately. Then we have the guide, which we hope will be published before the end of the year, which will be for information only.

Mr. FOREST: That is what we said would be recorded in three parts.

Mr. WOLOCHOW: Three parts, yes.

Mr. FOREST: The human factor, security devices, roads, everything.

Mr. WOLOCHOW: Yes.

Mr. FOREST: This is what you have prepared now?

Mr. WOLOCHOW: Just to give you an example, this is a draft of part 3. It is entirely informative. It is a collection of the best information that we—

An hon. MEMBER: Could you pass them around?

Mr. WOLOCHOW: No, we just brought samples because, as I say, these are now before the committee on final vote and we hope that in a matter of several weeks these will be available for this committee.

Mr. FOREST: Will it be several weeks?

Mr. WOLOCHOW: Well, I would say within a month.

Mr. FOREST: In preparing this code, under headings like "causes of accidents", are you collecting statistics from provincial authorities, municipal authorities, police departments, and so on? How do you go about it?

Mr. WOLOCHOW: Yes, they are all working with us. We are not calling it a code any longer, we are calling it a guide. The word "code" was used at first. We were not too happy with the word because it connoted legal matters; for instance, criminal code, and this kind of thing. We chose the word "code" because there is another code which is entirely voluntary, and that is the national building code. It is a collection of the best available information on how to put up safe buildings but it does not become operative until the municipality adopts it. Once a municipality adopts it, it becomes a building by-law of the municipality. The federal government issued the code and it is a collection of the best information on how buildings should be constructed. This is parallel to that, but the committee at its last meeting decided that the word "code" might, perhaps, be misleading, some people may think the federal government is legislating in this field. So, we agreed to use the word "guide", for better or for worse.

Mr. FOREST: Are you going into the causes of accidents?

Mr. WOLOCHOW: We are going into the causes of accidents as related to the driver, the human factor. We discuss the causes of accidents as related to the mechanical factor, which is the car, and we discuss the causes and prevention of accidents as related to the road. Now, it has been suggested that the guide have more parts, which we will have to consider. For instance, a part that will discuss the relationship between the legal aspects of the situation and traffic safety. In other words, what is the relationship between a certain law or regulation and the degree to which that law or regulation prevents accidents? It has been suggested that we have a fifth part, one that will discuss the relationship of education in more detail than is discussed in the first part, where the human factor is discussed, and in that fifth part there will be a more comprehensive consideration of the relationship of education in the prevention of accidents. Now, whether we will add those additional parts or not I cannot say at the present time because the committee is just considering the whole idea.

Mr. FOREST: Are you getting sufficient statistics across the board from all sources?

Mr. WOLOCHOW: We have all the statistics that are available at our disposal. There are certain problems in connection with statistics but we hope we can overcome those in the course of our study.

The CHAIRMAN: Mr. Goyer?

Mr. GOYER: Mr. Chairman, we would have to be engineers and lawyers to discuss the standards, but I have one line of questioning.

(Translation)

Is there any major difference or are there any major differences between standards as suggested, that is both Canadian standards which have been proposed and American standards which are now compulsory or which will become compulsory within a period of time?

(English)

Mr. WOLOCHOW: We have been working very closely, Mr. Chairman, with the United States authorities in this field and we are trying to keep as closely in line with them as possible. I think you understand why that is important. It is because the motor vehicle industry on this continent is more and more becoming an integrated one, and perhaps even in the western hemisphere. So, we are in very close touch with them and are collaborating with them. As an example of that, the gentleman who heads up the federal government group working on the standards was at our recent meeting, and we have been at some of their meetings. So we are keeping very closely in touch, but there are certain minor differences which, I think, can be accepted.

(Translation)

Mr. GOYER: Now, without wanting in any way to minimize the work you have been carrying out in this area, I would like to say, however, that because some things do exist, whether or not it is any doing of yours—I have reference here to the fact that there is no real automobile industry in this country. There may be an automobile industry as such but there are no Canadian makes of cars,

if you prefer. Is it not a little bit useless for us to be discussing these questions here in public. Would it not be better for us to discuss this in relation to the United States? Should not these matters, in other words, be discussed between American and Canadian Government officials? Should these people not meet, should there not be, if necessary, meetings between American parliamentarians and Canadian parliamentarians? We should not I think perhaps, be trying to devise original legislation which cannot be applied.

(English)

Mr. WOLOCHOW: Well, Mr. Chairman, to repeat what I said, we are working very closely with our counterparts in the United States and I think our standards are very compatible with theirs. They are still working on their standards, they are still revising them. Do not forget that so far in the United States these standards apply only to the purchase of government vehicles. I know, as you do, that just recently President Johnson signed two bills which have very wide ramifications, but the provisions of those bills have not yet been implemented. They are still working on the implementation. We do not know at this point in time what changes those standards which the federal government is following in the purchase of its own cars may go through before they become part of the provisions of the new legislation. This whole situation is in a state of flux all the way from what is happening in the industry to what we do in the field of standards. I do not think we know exactly what the end result in industry of the present changes now in progress will be. In any event, we are working very closely with the technical people. Whether the parliamentarians should meet is something that should be decided on that level. I do know that President Johnston has been urged to call an international meeting on traffic safety. I also know that in Europe there has been some action taken to establish a committee to deal with the problem. It is not at all impossible that Canada will participate on this European committee. So, these things are moving.

(Translation)

Mr. GOYER: No doubt. But I do feel that in Canada we are not very well placed to legislate in this area because we have no purely Canadian automotive industry. We could, of course, pass legislation, we could make recommendations but these could not be applied. Such recommendations that we could pass would be merely pious recommendations, so to speak. I wonder if we are not wasting our time in trying to act in an exclusive Canadian manner. And do you not think that we should really be trying to participate in these international discussions? Indeed we might take the initiative in this, because we are in a position of inferiority in this respect. I see where you have relationships established with the United States. We also get cars from Europe. Do you have the same type of relations, that is at the official level from government to government? Do you have the same type of relationships with the European governments and with which?

(English)

Mr. WOLOCHOW: Mr. Chairman, we have no official relations, as yet, with any European government. The European car manufacturers, those who have shown an interest in our work, were invited to come to our meetings, and they have copies of these draft standards. They have had opportunity to comment on them. That is how it stands right now.

With regard to the other problems of Canada's position in the motor industry, I do not think we can make any further comment. I think, because of the state of flux in which the whole situation is at the present time, we really do not know what the end result is going to be. I do not think that we should take the position that Canada does not count in this industry. I think Canada does count, and will have its influence in this matter.

(Translation)

Mr. GOYER: I understand very well that Canada is an important country in the area of car safety. However I fail to see how Canada can be important in a legislative way. In fact, Canada should be important I think in the area of research. We should also attempt to have international contacts, to have standards which we might like to suggest. These should be accepted by industries and other important governments. From the legislative point of view I fail to see what else we can do, except copy what has been done elsewhere. I am not asking you to comment on that because this is a matter of policy. I am sorry, I have concluded.

(English)

Mr. WOLOCHOW: I could make one comment, Mr. Chairman. In the international field, I have mentioned that there is some activity in Europe. We have been informed of their activity, and Canada very likely will be invited to participate in those meetings. We have already sent a message to Europe that, whenever they are ready, we will be glad to supply them with copies of our standards and guides; so that we have already established those lines of communication.

(Translation)

Mr. GOYER: One remark following your evidence. I note that whereas the Canadian Government could attempt to have close relationships with both European and American Governments as well as with those automobile makers who are outside Canada, what we are really attempting to do now is to set up guidelines to provide to the various provincial governments, and to apply such guidelines as come under our jurisdiction. We seem to be attempting to apply a great policy of road safety whereas to me this appears simply normal. There is nothing extraordinary about that. What would be better, what would be more unique is for this government to decide to have very well organized relationship with other countries, this would be on a regional basis and could contribute to road safety on a large scale.

(English)

Mr. McQUAID: Mr. Chairman, I would just like to inquire from the chief witness if any inspection has been made by the Specifications Board of the value of studded tires as a safety device in the winter time? I realize, of course, that it would be very difficult to set this down as a standard. I am just wondering if any tests have been made by your Specifications Board with respect to studded tires?

Mr. WOLOCHOW: Tests are being conducted in a number of places on the value of the tires, on the effect they have on the pavement and how they operate under various conditions, but certainly we are not prepared to make

any judgment at the present time. They seem to be very useful under certain circumstances; there are arguments for and against them; but as I say, I do think it is too early for us to make any real, considered judgment on them.

We discuss them in our guide; in part 2 of the guide we do discuss studded tires. We point out that there are advantages and disadvantages. What the balance will be between those two will, I think, depend on where and how they are used. Under certain circumstances there is no doubt that they are very useful. There are other situations where perhaps they should not be used. This is all pointed out in our discussion in part 2.

Mr. McQUAID: Are your investigations still being continued and will they possibly be continued to the point where you will be able to reach a conclusion?

Mr. WOLOCHOW: I am hoping that eventually that will be possible.

Mr. MATHER: I understand from what was said a little earlier about tires that there is in the guide some reference to safety standards, or safety specifications, for tires.

It seems to me. That one of the safety problems involved in tires, is the confusing way in which the industry labels or grades the tires. I find that some are said to be first line, second line, premium, or super; there does not seem to be any real standard of how a consumer, who is concerned with safety of what he is riding on, can judge.

The CHAIRMAN: It seems to be mileage.

Mr. MATHER: Mileage, yes; but also I think there is a safety factor involved in the quality policy not being too clearly indicated by the type of labelling that the industry uses. If we could come to a simple clear way of labelling or grading tires, whether it is one, two, three, or five star—whatever the standard was—would the witnesses agree that this would, in effect, be a move towards safety, through informing the public clearly on the quality and security of tires?

Mr. WOLOCHOW: First of all, Mr. Chairman, we have a standard on tires, 97-GP-14. We discuss tires in the guide.

I think the tire industry is alive to the situation right now in view of all the discussions.

Mr. Hanna is really more of an expert on tires than I am and he might add something to that.

Mr. J. E. HANNA (*Committee Secretary, C.G.S.B.*): I would agree with you, Mr. Mather, that it is desirable that the public be informed, and that the present designations used by manufacturers to signify quality are confusing. From the information I have, however, this is more an economic thing than anything else; that if you have the right size of tire for your vehicle, for the load you are going to carry in that vehicle, and you maintain it, you are safe. The low grade or cheap tire will give you that safety for a much shorter time than the higher grade or more expensive tire.

I think the main difference between tires at the moment is the length of time for which they will give safety, provided you have the right size of tire for the vehicle. I think there has been quite a bit of this, where vehicles have been fitted with tires which are suitable for a relatively lightly loaded vehicle—one or two passengers—and then they put the whole family in and load up a roof rack and the trunk and take off, and the tires are grossly over-worked. This, I think, is something where guidance is needed in getting the right size of tire, and I

think we are all providing a little guidance. I also think the industry is providing more guidance than they used to in getting the right size and capacity of tire.

Another reason, I think, that tires cause a great deal of trouble is improper maintenance. People do not check them often enough as regards inflation pressure; they do not increase their inflation pressure when they are in a heavily loaded situation, and they probably tend to run them too long.

Mr. AIKEN: I have a supplementary question on that. I have heard that tires which are nearly bald assume almost the action of a hydroplane in that, rather than gripping the road, it has been found that they actually ride above it on wet pavement.

Mr. HANNA: This is quite so. You need a tread pattern to allow the water to escape and not build up a wedge of water underneath the tire, separating the tire from the road surface.

Mr. AIKEN: In that connection, is the type of tread of significance, or are most of the treads on tires sufficient for normal purposes?

Mr. HANNA: The tread pattern is important. You could devise a tread pattern which would be poor, but I think most of the existing tread patterns are adequate in this regard provided that there is enough tread pattern left.

Mr. J. A. BANCROFT (*Consultant with D.D.P. on Committee on Traffic Safety*): To extend Mr. Hanna's answer to your question, we are recommending that automobiles have a plate indicating tire capacities for highway and load travel.

Mr. HANNA: This information now is usually buried in the driver's handbook some place where you cannot find it and do not see it and do not remember it. We think that a decal, or plate, some place in the glove compartment, or what have you, would be much more useful.

Mr. BANCROFT: Some one asked a question on studded tires. We are merely recommending, or stating, in our preamble that they substantially increase traction on icy and slippery surfaces and will reduce braking distance.

They have to be carefully selected. The installation pattern of the studs is important for the proper life and effectiveness of the studs. From what information we have available across the country the effect of studs on pavement appears to be negligible on the rolling wheel. Any damage that might occur, we feel, is offset by the safety value. We think that if we are going to use these studded tires, they should be confined to just that period of the winter months.

The CHAIRMAN: I have Mr. Tolmie, Mr. Goyer and Mr. Latulippe who want to ask some questions. Mr. Latulippe has not had an opportunity as yet, so if Mr. Tolmie and Mr. Goyer will agree I will ask Mr. Latulippe to ask his question first. Is that agreeable?

(Translation)

Mr. LATULIPPE: Mr. Chairman, I will be brief. What I would like to know is if, in the realm of safety devices for installation in cars you would have something like this to suggest to automobile manufacturers. There is something which is not quite right in cars with automatic transmission or power steering. You will have the engine stalling on a hill and the steering will stiffen to such an extent that the vehicle can no longer be controlled. There should be some safety device in this connection. I have seen accidents like this happen to new

cars. With this power steering, when the engine stalls the car can no longer be controlled. I am not familiar with your standards, but have you laid down anything in this connection?

(English)

Mr. HANNA: In our standard, Mr. Chairman, for the standard gear quadrant we require that the park position of the automatic transmission shall engage a brake lock, in effect; so that a transmission which complies with the requirements here could be locked if it stalled on a hill.

(Translation)

Mr. LATULIPPE: When the motor stalls the car, it becomes all but impossible to control. It stiffens up to a point where you can hardly control the car anymore. It seems to me that companies should have provided for this for some type of safety device in this respect.

(English)

Mr. BANCROFT: I believe, Mr. Chairman, we are speaking of power steering and power brakes; is that not so?

What we are recommending is that there be a reserve tank in the power train to assist the operator, during such occasions as you are referring to, to enable, the operator in bringing his automobile to a controlled stop.

Mr. HANNA: We are also suggesting in the guide part of this thing that the car be controllable by a relatively weak person for a short time, if the power assist on the brakes or if the steering fails. It should be controllable for a short time by a small woman, for instance.

Mr. GOYER: It is included in the guide lines?

Mr. HANNA: Yes.

Mr. WOLOCHOW: The situation in the steering is something similar to certain types of windows which were installed in certain buildings. There was a complaint from one development that they could not operate the window. Upon investigation it was found that the window was properly installed, but unfortunately the architect decided to use a rather large window, and this was a little old lady about 85 years old, four foot eight in height, and could not reach the controls. Now, you have this situation developing even in other fields.

The CHAIRMAN: Mr. Tolmie and then Mr. Goyer. Are you through, Mr. Latulippe?

Mr. LATULIPPE: Yes.

Mr. TOLMIE: Mr. Chairman, we have had some evidence about the fact that federal technical people and provincial technical people and their American counterparts have met. I understand from your evidence that these suggestions have been heard, and we now have these specifications before us.

I feel that perhaps the most important group to be represented at the meetings would be the automobile industry themselves. I think we all realize that this will be of tremendous importance to them from a financial standpoint. I was wondering (a) if there were representatives from the automobile industry present at these meetings; (b) if there were, do they have any objections to the validity of some of these devices, and, if so, which devices?

Mr. WOLOCHOW: Mr. Chairman, I am glad this question was asked because it indicates that I was a bit remiss in giving you information.

Certainly the motor vehicle manufacturers are represented on our committee. The industry has an engineering committee consisting of the chief engineers and the chairman of that committee is an official member of our committee; his vice-chairman is his alternate on our committee, and all the members of the industry committee were invited and attended these meetings.

In addition to that I think I mentioned that representatives from the European manufacturers, who are not, as yet, on the engineering committee because, perhaps, they are not quite ready with respect to their manufacturing operations on this continent, but certainly some of the important European manufacturers were also present. They have given us very splendid co-operation. They have raised objections where they thought they had some objections but I can say, Mr. Chairman, that these standards have met with the approval of the representatives of the motor vehicle manufacturers. They also approved the guide. As a matter of fact I think the motor vehicle manufacturers have taken a greater interest and have co-operated with us even beyond our expectations which, of course, has been very gratifying to us. We can understand their interest in this field because it vitally affects the welfare of the industry especially when you consider what some of the things in the future might be.

Mr. TOLMIE: Thank you very much.

(Translation)

Mr. GOYER: Mr. Chairman, I note there that research has been carried out at the federal level with regard to car safety. How much money do we put into this research?

(English)

Mr. WOLOCHOW: Mr. Chairman, I think we must appreciate that the federal government has just recently entered this field. I think that everyone accepts that control of the traffic situation was entirely a provincial matter but, in due course, questions were raised in the House of Commons, and parliamentarians were asking questions. The government also wanted to do something to protect the drivers of its own vehicles. As you know, and you know as well as I do, it gradually became involved in it. I think you will agree with me that it is a very complex situation but the government is studying this matter very, very carefully.

At the meeting of our committee last June there was a recommendation by the committee, which represented, I believe, a good cross section of all those people interested in this situation, that the government give consideration to the establishment of a national accident prevention research centre. That recommendation was conveyed to the responsible minister of the government and that minister has asked the National Research Council to research this matter, give it careful study, and to submit its recommendations to him. I cannot make any comments about how much money the government will spend. I must emphasize that the government is very much concerned and I would not be surprised if, in due course, it will take a very active role in this matter of research. We have the National Research Council which I think everyone will agree is a very

competent research body, and it is now making the preliminary studies of what is required and how much it might cost.

(Translation)

Mr. GOYER: As far as policy is concerned, I do not want to put any questions to you in this regard. However, I believe that there is a federal responsibility here as far as research is concerned in this area. I believe that all that can be done by us is to have the results of our research accepted by other countries. This, then, is a matter for international relationships. However, to return to the purely technical or administrative point of view, could you tell us exactly how long the federal government has been looking into this?

(English)

Mr. WOLOCHOW: Well, I think this started a little over a year ago. I think maybe the brief that one of your colleagues had prepared and submitted to the government might be accepted as official initiation of this, although the government certainly was concerned about the safety of its own employees in driving vehicles. I think, perhaps, the federal government was the first official body which decided to install safety belts.

(Translation)

Mr. GOYER: Do you already have original standards which have been discovered or developed by you, by the federal officials here, by the officers of the department? Do you have such original standards which you could already suggest to other countries?

(English)

Mr. WOLOCHOW: Well, I think, Mr. Chairman, the standards are reflected in these 27 draft standards pretty well.

(Translation)

Mr. GOYER: I am sorry, I am not an engineer. I have not been looking at this very closely. I was simply asking this. I know that there is a great deal here which has been drawn from American or other countries' experience. Is there anything particularly Canadian here which you could have suggested had you thought that it would be possible to apply it, that you would not have put in here, in other words, because you felt it could not be applied by the Americans?

(English)

Mr. HANNA: Well, Mr. Chairman, there is one of the 27 here in which, I think, we had a very major part, and that is the rear window defrosters. We consider that this was a problem that was of more concern here than in the United States and we had a draft on this before they did. The document which we have here has some American influence in it but theirs has more Canadian influence than ours has American influence. The rest of them are largely American in origin but at least we have made a major contribution to one of them.

(Translation)

Mr. GOYER: I understand that this work has only been going on for a year, but have you started establishing some kind of priorities with regard to the products made by such and such a company? What I mean is this.

For instance, as far as tires are concerned, could you tell us whether one type of tire, one brand, is superior to another? Have you started drawing up any priorities of this kind?

(English)

Mr. HANNA: You had better answer the last one and Mr. Bancroft had better supplement my answer to the previous one.

(Translation)

Mr. GOYER: If I spoke of tires, it was simply as an example. You can answer in a very general way. I have absolutely nothing against the tire industry in particular.

(English)

Mr. WOLOCHOW: Well, let me say this, Mr. Chairman. For about 15 years we have had a government standard for tires, and this standard has been used by government departments when purchasing tires of all kinds. Now, of course, we must admit the government buys a limited variety of vehicles, it does not buy Cadillacs. We have these technical standards in the government. In some cases I think we can, in all modesty, say that our standards were perhaps ahead of some of the standards in the other countries. In using these standards the government has equipment which it uses for evaluating tires. There is a proving ground in Ottawa for testing tires but that information, of course, has been made available only to government departments. I do not think we could possibly make any statement on whether one make of tire is better than another. I do not know if anyone knows, except in those cases where there has been a reason for the government testing agencies to evaluate certain tires that have been offered for a specific purpose, according to our standards.

(Translation)

Mr. GOYER: Of course I realize that it is not up to you to reveal standards, but it is a good thing to find out that these do exist. Of course, we would not want to favour some type of people over others.

(English)

The CHAIRMAN: Thank you, Mr. Goyer.

Mr. BANCROFT: I would like to supplement Mr. Hanna's answer to your question regarding some originalities from Canada. Standard number 26, which is the outside ornamentations and accessories, is a Canadian development which will not be found in any of the United States standards. Number 27, the rear luggage compartment barrier, is a Canadian development which will be not found in any of the American standards.

To go back to number 26, the ornamentation and accessories, certain material was obtained from the French government and much of this was reviewed from the code de la route for France. The French had made considerable studies of the protrusions on the exterior of automobiles. To the question, "Could such things apply to our models, on this side, today?" The answer is "yes, the removal of outside ornamentations could be done with very little cost and inconvenience".

To revert to another question, about working in line with the Americans. Mr. Wolochow mentioned that we are working closely with the Americans. In

attending some of their working committee meetings it seemed to me they said they would like to work closely in line with us. This is really a continental effort.

The CHAIRMAN: If we have completed questioning the witnesses, I would like to express our thanks to Mr. Wolochow, Mr. Hanna, and Mr. Bancroft for your presentation and, in particular, for the very clear, concise and illuminating way in which you answered the questions. I think members of the Committee have derived a great deal of benefit from this. We wish to thank you most sincerely.

Mr. Wolochow, it is our practice to append presentations to our proceedings. Have you any objection to making your guide an appendix to today's proceedings. I know it is in draft form and there may be some changes in it before it is formalized, but if it was appended to the minutes of this meeting, it would be available for further study.

Mr. WOLOCHOW: It would be a privilege, sir.

The CHAIRMAN: I think that is agreeable, I would entertain a motion that the draft standards of the Canadian Government Standards Board be appended to today's proceedings; also, that the draft guide be also included as an appendix.

Mr. MATHER: I so move.

Mr. TOLMIE: I second the motion.

Motion agreed to.

The CHAIRMAN: Next Tuesday, we are going to have Mr. Robert Malkin as our witness. The Clerk of the Committee has obtained from the Imperial government their bill on the question of road safety. It deals, in large part, I take it, with people who drive with an undue proportion of alcohol in the blood. I understand there is a cost of \$25 for procurement of this. May I have a motion that this account be paid?

Mr. FOREST: I so move.

Mr. MCQUAID: I second the motion.

Motion agreed to.

The CHAIRMAN: These will be distributed to all members through the mail. You will then have an opportunity to read them.

Mr. Ray, is there anything else that should come before the Committee? If not, we will adjourn and I believe we will be meeting at 11 o'clock on Tuesday. I did tell you we would be meeting today at 11 o'clock but the Clerk of the Committee got it changed to 9.30 a.m. for same reason. We will try to maintain the hour of 11 o'clock for all our meetings.

APPENDIX '5'

DRAFT COPY ONLY OF
Canadian Government Specifications Board
Standards 97-GP-1
through 97-GP-27

(for index to Standards see Appendix 6, end of Part II)

TABLE OF CONTENTS

- 97-GP-1 Restraining Devices and Anchorages
- 97-GP-2 Energy-Absorption Components in the Forward Compartment
- 97-GP-3 Recessed Panel Mounted Instruments and Control Devices
- 97-GP-4 Energy Absorbing Steering Control System
- 97-GP-5 Safety Door Latches and Hinges
- 97-GP-6 Anchorage for Seats
- 97-GP-7 Four Way Flasher
- 97-GP-8 Safety Glazing Materials
- 97-GP-9 Dual Operation of Brake System
- 97-GP-10 Height and Extension of Bumpers
- 97-GP-11 Standard Gear Quandrant (P R N D L)
- 97-GP-12 Windshield Wipers and Washers
- 97-GP-13 Glare Reduction Surfaces
- 97-GP-14 Tires and Rims
- 97-GP-15 Back-up Lights
- 97-GP-16 Rear View Mirror(s)
- 97-GP-17 Rear Window Vision Aid
- 97-GP-18 Window and Door Controls
- 97-GP-19 Ash Trays and Lighters
- 97-GP-20 Arm Rests
- 97-GP-21 Padding for Seat Backs
- 97-GP-22 Head Rest
- 97-GP-23 Side Marker Devices
- 97-GP-24 Roll Bars
- 97-GP-25 Fuel Tanks
- 97-GP-26 Outside Ornamentation Accessories and Protrusions
- 97-GP-27 Rear Luggage Compartment Barrier

97-GP-1

1 November 1966

STANDARD

for

RESTRAINING DEVICES AND ANCHORAGES
for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for three types of restraining devices and their anchorages.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:

2.1.1 Society of Automotive Engineers (SAE):

J4 —Motor Vehicle Seat Belt Assemblies.

J787—Motor Vehicle Seat Belt Anchorage.

J826—Manikins for Use in Defining Vehicle Seating Accommodation.

- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:

Passenger cars

Station wagons

Light trucks up to 10,000 lb. GVW.

Buses and school buses, where so designated

Standard commercial trucks, where so designated

Other vehicles, when mode of operation so demands for the safety of the occupants.

4. *Detail Requirements*

4.1 *Restraining Devices*

- 4.1.1 Restraining device may be a lap belt, or a seat belt assembly, as follows:

4.1.1.1 *Type 1*—A lap belt for pelvic restraint.

4.1.1.2 *Type 2*—A seat belt assembly combination for pelvic and upper-torso restraint.

4.1.1.3 *Type 2a*—A seat belt assembly consisting of a shoulder belt for upper-torso restraint and a lap belt (*Type 1*).

4.1.2 All restraining devices shall comply with SAE J4.

4.1.3 Where feasible, restraining devices shall be supplied with the vehicle as OEM (Original equipment manufacture) items.

4.1.4 Where feasible and so designated, seat belts or seat belt assemblies shall be provided for each occupant for which the vehicle is designed.

4.2 Anchorages

4.2.1 A seat belt anchorage consists of an attachment point in a suitable part of the vehicle structure which may include the seat.

4.2.2 Anchorages shall comply with SAE J787.

4.2.3 Anchorages shall be provided for each authorized occupant seating position in accordance with SAE J787.

4.2.4 *Location of Anchorages for Type 1 Seat Belt and for Lap-Portion of Type 2 and Type 2a Seat Belt Assemblies—*

4.2.4.1 The anchorage for *Type 1* seat belt assemblies and the lap-portion of *Types 2 and 2a* seat belt assemblies shall be placed so that a line from the anchorage to the passenger's "hip" (defined as the "H" point in SAE J826) will make an angle from the horizontal as near as practicable to 45 degrees, as shown in Figures 1, 2 and 3 of SAE J787. The location of the hip-point shall be determined by following the procedures in SAE J826.

4.2.4.2 Anchorages for belts that will be installed over the seat-bottom-frame rear bar shall be rearward of a vertical line through the point where the belt will enter the seat, as shown in Figure 4 of SAE 787. All anchorages shall be spaced laterally so that the lap portion of the belt forms essentially a U-shaped loop when in use. Buses using *Type 1* seat belts shall utilize the seat for anchorage points. Floor and wall anchorage points are permitted in buses only if entrance and egress are not obstructed.

4.2.5 *Location of Anchorages for the Upper-Torso Portion of a Type 2 Seat Belt Assembly and for a Type 2a Shoulder Belt*

4.2.5.1 As a minimum, these anchorages shall be provided for each outboard seating position in passenger cars and station wagons, and each front seat outboard position in light trucks. In buses, only the driver's seat need be provided with these anchorages. At least one anchorage shall be provided for the upper end of each upper-torso restraint. These anchorages may be located in the seat, side or rear structure, roof, or floor, provided that the structure over which the restraint passes, or to which it is fastened, has been designed or reinforced to withstand the resulting load, and the attached belt will comply with angle requirements. When in use, these anchorages shall not obstruct entrance to or egress from any seat to the rear.

4.2.5.2 The lower end of the upper-torso restraint may be fastened to the lap belt of a *Type 2* assembly or to an existing inboard anchorage for a *Type 1* belt. With the seat at its rearmost limit of travel, and the seat back in its rearmost driving position, the anchorages for the upper end of the upper-torso restraint shall be on, or rearward of, the extension of the SAE J826 two-dimensional manikin's torso line.

4.2.5.3 An upward angle of the upper torso restraint passing from the shoulder reference point to an anchorage is desirable. If there is a

downward angle of the upper torso restraint passing from the shoulder reference point to an anchorage, or to a suitable structure between the shoulder point and an anchorage, this angle shall be not more than 40 degrees downward from the horizontal.

4.2.6 *Strength of Anchorages*

4.2.6.1 *Anchorages for Types 1, 2 and 2a Restraining Devices*

Anchorages shall meet the strength requirements specified below, when tested in accordance with 4.3. Permanent deformation of any anchorage or surrounding area is acceptable provided there is no rupture nor breakage and the anchorage does not pull loose. Anchorages shall withstand the following minimum forces:

Anchorage and Belt Type

	<i>Force, lb.</i>
Separate anchorages for Type 1 belts	2,500
Each outboard anchorage for pelvic portion of Type 2 assembly	2,500
Each outboard anchorage for upper portion of Type 2 assembly or Type 2a belt	1,500
Common anchorage for inboard end of Type 1 belt in combination with Type 2a belt	3,000
Inboard anchorage for one end of center-positioned Type 1 belt and either inboard end of Type 1 belt in combination with Type 2a belt, or inboard end of Type 2 assembly	5,500
Common anchorage for inboard ends of two lap belts, and inboard ends of two upper-torso restraints	6,000

4.2.6.2 *Anchorages for a seat belt assembly attached to the seat frame*—The seat structure, seat adjusters if applicable, and attachments shall withstand the forces specified in 4.2.6.1 as applicable, plus the seat inertia force. The seat inertia force shall be not less than 20 times the seat weight. Floor and seat deformation are acceptable provided there is no structural failure or release of the seat adjuster mechanism.

4.3 *Test for Strength of Anchorages*

4.3.1 *General*

Seats shall be in place in the body of the vehicle structure but structures giving the equivalent effect of closed doors may be substituted for doors. The load shall be applied at an upward angle of 10 ± 5 degrees from the horizontal. As a minimum, the vehicle structure shall be subjected to simultaneous pull on all anchorages for all designed seating positions of each seat assembly. The load shall be applied toward the rear for seats facing the rear. When common anchorages are used for forward- and rearward-facing seats, the loads shall not be applied simultaneously. Anchorages for the

upper end of upper-torso restraints may be tested independently if they are located in structural members in which no pelvic restraint anchorages are located. All seats in the lateral position shall be tested simultaneously.

- 4.3.2 *Test for Type 1 Seat Belt Anchorages*—The loads specified in 4.2.6.1 and 4.2.6.2 shall be applied using either a body block similar to that shown in Figure 5 of SAE J787 or a suitable equivalent method. The strength test shall be conducted either with the seat installed or an applicable vehicle floor pan.

- 4.3.3 *Test for Types 2 and 2a Seat Belt Anchorages*—The loads specified in 4.2.6.1 shall be applied using either a body block as shown above, or a suitable equivalent method. The strength test shall be conducted with the seat in place in the vehicle.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary Canadian Government Specifications Board, Department Defence Production, Ottawa 4 Canada.

97-GP-2,

1 November 1966.

STANDARD

for

ENERGY-ABSORPTION COMPONENTS IN
THE FORWARD COMPARTMENT
OF AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for forward compartment energy absorption components for automotive vehicles.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this Standard:
- 2.1.1 Canadian Government Specifications Board (CGSB)
97-GP-1, Restraining Devices and Anchorages for Automotive Vehicles
97-GP-3, Recessed Panel Mounted Instruments and Control Devices for Automotive Vehicles
- 2.1.2 Society of Automotive Engineers (SAE)
J826, Manikins for Use in Defining Vehicle Seating Accommodation
J921, Recommended Practice for Instrument Panel Laboratory Impact Test Procedure.
- 2.1.3 United States Public Health Service Publication No. 1000, Series 11, Number 8 — Weight, Height, and Selected Body Dimensions of Adults.
- 2.2 Reference to the above publications is to the latest issue unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
- Passenger cars
Station wagons
Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 *Forward Compartment*—The forward compartment, which includes the areas of the instrument panel, sun visors, header, corner A-pillars, and under the instrument panel, shall be designed and constructed to afford a reasonable degree of protection for the front-seat occupants wearing 97-GP-1 lap-type seat belts.
- 4.2 *Injury Potential*—Injury potential shall be minimized by constructing or locating forward-compartment structures to eliminate impact

- and to reduce forces imposed upon front-seat occupants wearing 97-GP-1 Type 1 seat belts, under collision conditions.
- 4.3 The instrument panel, including the padding assembly, shall not contain any sharp or protruding rigid edges in the head impact area (par. 4.13).
 - 4.4 The panel below the windshield shall be covered, at least in the impact area (par. 4.13) determined by the manikin, with energy-absorbing cushioning material applied over a crushable or collapsible metal backing that will deform and expand the areas of contact, to cushion and spread the impact of a passenger's head.
 - 4.5 The structure of the instrument panel, with padding in the impact area (par. 4.13), shall be designed to reduce the likelihood of injury to the passenger's head upon impact.
 - 4.6 When passenger cars and station wagons are tested in accordance with SAE J921, the deceleration of the head form when impacting the panel at 22 feet per second shall not exceed a value of 80 g's excluding all portions of the deceleration time curve above the 80 g level of less than 1.0 millisecond duration. The applicable "less than 1.0 milliseconds" time of duration shall be that measured at the 80 g level on the deceleration time curve.
 - 4.7 Within the impact area (par. 4.13) the instrument panel, constructed of or covered with force-distributing cushioning material, shall expand the areas of contact and deform to conform to the performance requirements in 4.6.
 - 4.8 The lower portion of the instrument panel shall contain no sharp nor protruding edges in the knee and leg impact areas. Within the impact areas, the panel, constructed of force-distributing cushioning material, shall expand the areas of contact and deform to distribute the forces and minimize injury when struck by the knees or legs. Control devices and instruments in these impact areas shall comply with the requirements of 97-GP-3.
 - 4.9 The sun visors shall be constructed of energy-absorbing cushioning material to attenuate injuries caused by impact of the head against the windshield. The sun visor mounting shall be designed and located to provide a reasonable degree of head protection.
 - 4.10 The roof header impact area shall contain no sharp nor protruding edges. The impact area shall be covered with energy-absorbing cushioning material to reduce the likelihood of injury to the occupant's head upon impact.
 - 4.11 The right and left front corner posts shall not contain any sharp or protruding edges. The corner posts in the impact areas (par. 4.13) shall be covered with energy-absorbing cushioning material at least 0.5 inch thick to reduce the likelihood of injury to the occupant's head upon impact. Padding shall be designed and placed to minimize loss of visibility.
 - 4.12 The glove-compartment door shall be constructed and mounted to minimize the likelihood of injury to occupants upon impact.

4.13 Impact Area

- 4.13.1 The head impact shall be established through the use of 97-GP-1 Type 1 seat-belt-restrained manikins, or other test devices, having "H" point (SAE J826) to top-of-head dimensions of 33 and 29 inches. Adjustable seats shall be in the extreme forward-driving or riding position for the 33-inch device and in the extreme rearward position for the 29-inch device. The impact area shall be that included between the arcs formed by the top-of-head point when each device is swung forward and also 45 degrees to each side of the longitudinal axis through each normal seating position. The knee and leg impact areas shall be established by the use of 97-GP-1 Type 1 seat-belt-restrained manikins, or equivalent, of approximately 95 percentile male dimension, with the front seat in mid-position. The 95th percentile male is defined in U.S. Public Health Service Publication No. 1000, Series 11, Number 8.
- 4.13.2 The impact areas in all portions of the instrument panel and doors that may be contacted, shall be determined by swinging the manikin's knees and legs 45 degrees right and left at each designed seating position, with the manikin's "H" point moved horizontally forward 10 inches and its feet resting in their normal toeboard position.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-3

1 November 1966.

STANDARD

for

RECESSED PANEL-MOUNTED INSTRUMENTS AND CONTROL DEVICES
for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for automotive vehicle instruments and control devices to afford, in the event of a collision, a reasonable degree of protection for front-seat occupants wearing lap belts

2. *Applicable Publication*

- 2.1 The following publications are applicable to this standard:
 - 2.1.1 Canadian Government Specifications Board (CGSB) 97-GP-1, Restraining Devices and Anchorages for Automotive Vehicles.
 - 2.1.2 Society of Automotive Engineers (SAE) J826, Manikins for Use in Defining Vehicle Seating Accommodation.
- 2.2 Reference to the above publication is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
 - Passenger cars
 - Station wagons
 - Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 *Injury Potential*—Injury potential shall be minimized by constructing, locating and mounting control devices and instrument bezels to reasonably minimize contact by the heads of occupants wearing 97-GP-1 Type 1 seat belts.
- 4.2 *Location*—All instrument-panel-mounted control devices (except devices not essential to controlling a moving vehicle) shall be located within reach of the driver while he is wearing a 97-GP-1 Type 2 or 2a seat belt assembly. The essential controls are the steering wheel, transmission selector lever, turn signals lever, ignition switch, choke control, headlight switch, and windshield wiper and washer controls. Essential controls shall be readily identifiable.
- 4.3 *Contact Areas*
 - 4.3.1 Control devices shall have a contact area of not less than 1 square inch of flat surface, with an edge radius of not less than 0.125 inch.

When a force not exceeding 90 pounds is applied from any position defined in 4.4, the devices shall deflect to within 0.375 inch of the panel surface, shall be pushed flush with the panel surface, or shall be detached.

- 4.3.2 Control devices and instruments positioned outside the established impact area, or that cannot be struck due to steering wheel, column, or shielding, are not required to meet the requirements of 4.3.1.
- 4.3.3 Instruments and instrument bezels within the impact area, and not prevented from contact as previously specified, shall have an edge radius of not less than 0.125 inch and shall project not more than 0.250 inch above the surface of the panel.
- 4.3.4 The lever knobs of selector levers and signal levers, when mounted within the impact area as defined in 4.5, shall have a relatively flat area of at least 1.0 square inch. Complete penetration of the knobs by the shafts shall not occur under an impact of 2,500 pounds
- 4.4 *Impact Area*—The impact area shall be established through the use of 97-GP-1 Type 1 seat belt-restrained manikins, or other test devices, having "H" point (SAE J826) to top-of-head dimensions of 33 and 29 inches. Adjustable seats shall be in the extreme forward position for the 33-inch device and in the extreme rearward position for the 29-inch device. The impact area shall be that included between the arcs formed by the top-of-head point when each device is swung forward and also 45 degrees to each side of the longitudinal axis through each normal seating position.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-4

1 November 1966.

STANDARD

for

ENERGY-ABSORBING STEERING-CONTROL SYSTEM
for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for energy-absorbing steering-control systems in automotive vehicles to minimize the likelihood of crushing or penetrating injuries to occupants as a result of frontal impact.

2. *Applicable Publications*

- 2.1 The following publication is applicable to this standard:

- 2.1.1 Society of Automotive Engineers (SAE) J850, Recommended Practice for Barrier Collision Tests.
- 2.2 Reference to the above publication is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
Passenger cars
Station wagons

4. *Detail Requirements*

- 4.1 The steering-control system is defined as the basic steering mechanism in combination with its associated horn-actuating mechanism, trim hardware, etc., and includes any portion of the steering column assembly that may contain an energy absorber for the purpose of dissipating energy upon impact.
- 4.2 The steering-control assembly shall be so constructed that when it is impacted at a relative velocity of 22 feet per second with a torso-shaped body block (Figure 1), weighing 75-80 pounds and having a spring rate load of 600-800 pounds per inch, it will absorb the energy of the body block. The force developed during collapse of the system shall not exceed 2,500 pounds. The spring rate is determined by loading the chest of the torso-shaped body block with a 4-inch wide, flat contact surface so that it is 90 degrees to the longitudinal axis of the body block, parallel to the backing plate, and 15 to 20 inches from the top of the head form. The load is measured when the flat contact surface has compressed the body block material $\frac{1}{2}$ inch, and the spring rate is determined by doubling this load figure.

- 4.2.1 When the steering wheel is the principal energy-absorbing element, the load-cell recording device shall be equivalent to the type shown in Figure 2, and shall be mounted either directly behind the wheel or in the frontal surface of the body block, with its axis of primary sensitivity in the direction of body-block travel at the time of impact. The steering wheel shall be mounted to the load cell by means of an appropriate nose piece at the same angle as it is to be installed in the vehicle.
- 4.2.2 When a component or components other than the steering wheel, such as the steering column, is the principal energy-absorbing element or contributes substantially to the absorption of energy, the load cell shall be located between the steering wheel and the remainder of the energy-absorbing system, preferably immediately under the wheel or in the forward impacting surface of the body block.
- 4.2.3 Other testing methods, such as high-capacity acceleration facilities and anthropometric dummies, giving equivalent results, may be used in lieu of the methods defined in 4.2.1 and 4.2.3.
- 4.3 The steering-control assembly shall be so designed that when the front structure of the automotive vehicle collapses during the SAE J850 barrier collision test at 30 miles per hour, the upper end of the steering control system shall not be displaced rearward, relative to an undisturbed point to the rear of the steering wheel position, more than 5 inches. The rearward displacement of the steering-control assembly shall be determined under dynamic conditions during the barrier collision or equivalent test.
- 4.4 The steering-control system shall be so constructed that there shall be no devices nor attachments such as horn-actuating mechanism, trim hardware, etc., that can catch in the operator's clothing during normal driving manoeuvres.

5. Notes

- 5.1 The publication listed in Section 2 available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

FIGURE 1.—50th percentile torso shaped body block.

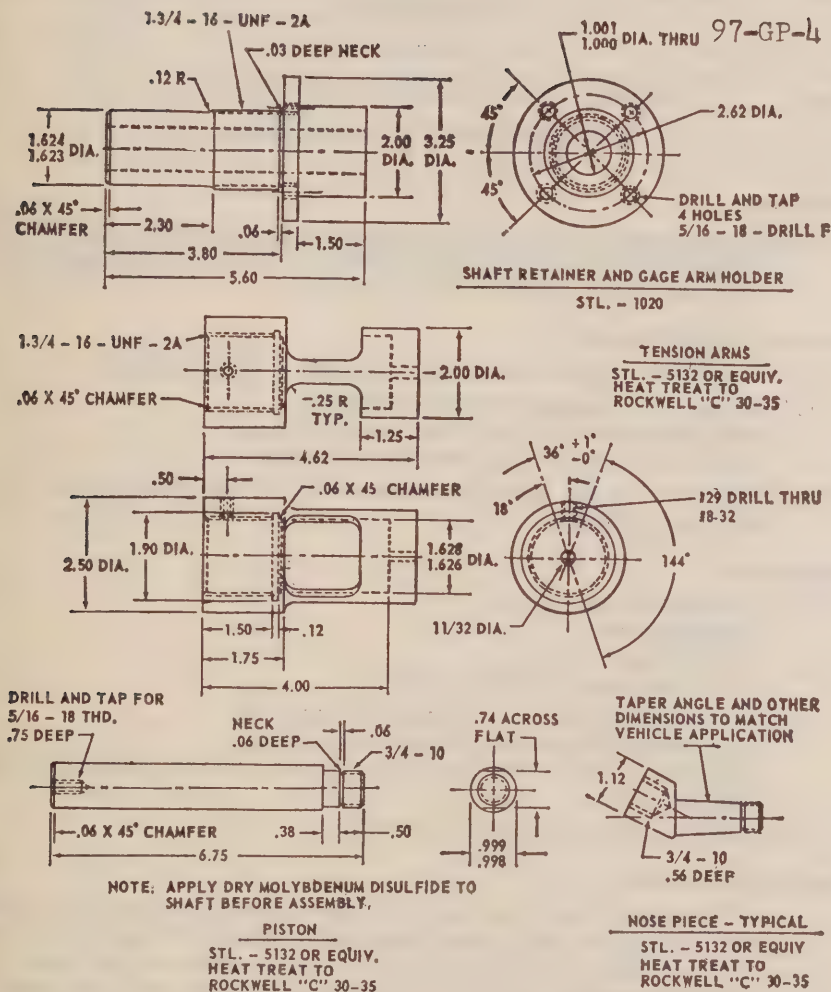

FIGURE 2.—Load cell.

97-GP-5

1 November 1966.

STANDARD

for

SAFETY DOOR-LATCHES AND HINGES

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes minimum static load requirements for side-door latch mechanisms and hinges to minimize the possibility of occupants being ejected from the vehicle.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:
 - 2.1.1 *Society of Automotive Engineers (SAE)*
J839, Passenger Car Side-Door Latch Systems
J934, Vehicle Passenger Door Hinge Systems
- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
Passenger cars
Station wagons
Light trucks up to 10,000 lb. GVW.
- 3.2 *Exceptions*—This Standard does *not* apply to:
Light trucks with folding or cargo-type doors
Open-body trucks with enclosures made of canvas, aluminum, glass fiber and steel.

Secondary latch loads (4.2, 4.3) do not apply to sliding doors.

4. *Detail Requirements*

- 4.1 All applicable vehicles shall be equipped with safety door-latches and hinges. The hinges shall have ample strength to support the door and to withstand a longitudinal load and a transverse load equal to or greater than the loads specified in 4.2 and 4.3 for the door-latch and striker assembly. All door-release mechanisms shall be provided with a single positive locking device not subject to accidental release. Interior or exterior handles need not be locked by this device if not operable by accidental side, rearward or forward force.
- 4.2 *Longitudinal Load*—Automotive vehicle door-latch and striker assemblies, when tested as prescribed in 4.4, shall withstand a mini-

mum longitudinal load of 2,500 pounds when in the fully latched position, and 1,000 pounds when in secondary latch position.

4.3 *Transverse Load*—Automotive vehicle door-latch and striker assemblies, when tested as prescribed in 4.4, shall withstand a minimum transverse load of 2,000 pounds when in the fully latched position and 1,000 pounds when in the secondary latch position. For vehicles equipped with sliding doors, each track and slide combination shall withstand the transverse loads specified for latches and hinges when the door is in the fully latched position. Force shall be applied to the upper and lower edges of the door as close to the track as possible.

4.4 *Test Procedures*—Test procedures and equipment shall be in accordance with Sections 4 and 5 of SAE J839 and Section 4 of SAE J934.

5. Notes

5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-6

1 November 1966.

STANDARD

for

ANCHORAGE OF SEATS

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements and test procedures for the capacity of anchorages and construction of automotive vehicle seat assemblies.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:
 - 2.1.1 *Society of Automotive Engineers (SAE)*
J787, Standard for Motor Vehicle Seat Belt Anchorages
J826, Manikins for Use in Defining Vehicle Seating Accommodations.
J879, Passenger-Car Front Seats and Seat Adjusters.
- 2.2 Reference to the above publications is to the latest issues, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
 - Passenger cars
 - Station wagons
 - Buses and school buses when so designated
 - Light trucks up to 10,000 lb. GVW.
 - Heavy trucks when indicated

4. *Detail Requirements*4.1 *Definitions*

- 4.1.1 *Seat Frame*—The seat frame is the structural portion of a seat assembly.
- 4.1.2 *Upper Crossbar*—The upper crossbar is the uppermost horizontal member of a seat-back frame.
- 4.1.3 *Seat Adjuster*—The seat adjuster is the device anchored to the seat frame and provides for seat adjustments. This includes any track, link, or power actuating assembly to adjust the seat position.

4.2 *Front Seats*

- 4.2.1 *Seat-Adjustment Mechanism and Seat-Frame Combinations*—Each combination of seat-adjustment mechanism and seat frame, together with attachments, shall be constructed and anchored to the vehicle

structure that supports it so as to resist a horizontal forward or rearward static load not less than 20 times the weight of the complete seat assembly. Each seat-back frame shall withstand a rearward (in relation to the seat) movement about the "H" point (SAE J826) of 3,300 inch-pounds for each designed seating position. The required load or loads for each designed seating position shall be applied simultaneously to the seat back frame upper crossbar at the vertical centerline of each seating position.

- 4.2.2 Fixed Seat Frame Combinations**—Each nonadjustable seat frame combination, with attachments, shall be constructed and anchored to the vehicle structure that supports it so as to sustain a horizontal and rearward static load not less than 20 times the weight of a fully trimmed seat. Each seat back frame shall withstand a rearward static moment about the "H" point (SAE J826) of 3,300 inch-pounds for each passenger for which the seat back is designed. The load required to attain this moment shall be applied simultaneously to the seat back frame upper crossbar at the vertical center line for each seating position.
- 4.2.3 Folding-Seat Back Frames**—Each seat-back frame designed to fold over the seat shall be equipped with a releasable, self-locking, restraining device or devices. The lock release shall be readily accessible to the occupant of the seat and, if applicable, shall permit egress of rear-seat passengers. The locking device shall be so designed and located as to minimize accidental release in collisions. The restraining device or devices shall be constructed to prevent the seat-back frame assembly from folding forward under a horizontal static load not less than 20 times the weight of the fully trimmed seat back frame, with the frame in a locked position. It shall withstand a rearward moment about the "H" point (SAE J826) of 3,300 inch-pounds for each designed seating position. The load or loads required for each designed position shall be applied simultaneously to the seat-back frame upper crossbar at the vertical centerline of each seating position. Excluded are tilt-type drivers' seats installed in special-purpose stand-up walk-in delivery vehicles.
- 4.2.4 Pedestal Seats**—Pedestal-mounted drivers' seats designed to pivot forward, installed in special-purpose stand-up walk-in type delivery vehicles, shall be equipped with releasable self-locking pedestal-restraining devices. The restraining device shall be constructed with sufficient strength to prevent the seat assembly from tilting forward under a horizontal static load not less than 20 times the weight of the fully trimmed seat and components. The load shall be applied with the seat pedestal in a locked position and at the level of the centre of gravity of the seat assembly.
- 4.3 Rear Seats and Intermediate Seats**
- 4.3.1 Forward and Rearward Fixed Seat Frame Combinations**—Each combination with attachments shall be constructed and anchored to the vehicle structure so as to withstand the loads specified in 4.2.2.

4.3.2 *Forward and Rearward Facing Detachable Seat-Frame Combinations*—Each combination, with attachments, shall be constructed and anchored to the vehicle structure so as to withstand the loads specified in 4.2.2.

4.3.3 *Longitudinally Mounted Seat Frame Combinations*—Each combination, with attachments, shall be constructed and anchored, either permanently or by detachable fittings, to the vehicle structure so as to withstand a horizontal forward and rearward (in relation to the vehicle) static load not less than 20 times the weight of the fully trimmed seat.

4.3.4 *Folding Seats*—Seats designed to pivot forward on their forward attachment to the vehicle structure shall be equipped with a releasable, self-locking restraining device or devices. The lock release shall be readily accessible to the occupant of the seat and if applicable, shall permit egress of a passenger seated to the rear. The release shall be so designed and located as to minimize accidental release in collision. The restraining device shall be constructed with sufficient strength to prevent the seat assembly from folding forward or displacing under a horizontal static load not less than 20 times the weight of the fully trimmed seat assembly.

4.3.5 *Folding-Seat Back Frames*—Folding seat back frames of intermediate and rear seats shall conform to the requirements of 4.2.3.

4.4 *Seats Designed to Provide Seat-Belt Anchorage*—In passenger cars, station wagons, and light and heavy trucks, seat frames and seat-back frames designed to provide anchorages for seat belts shall be constructed and anchored to the vehicle structure that supports them so as to resist an additional forward static load not less than 2,500 pounds for each lap belt end attached, or 3,000 pounds for each combination lap and shoulder belt end.

4.5 *Buses*

4.5.1 *Driver's-seat frames and seat-back frames designed to provide anchorages for seat belts* shall be constructed and anchored to the vehicle structure that supports them so as to sustain an additional static forward load not less than 2,500 pounds for each combination lap and shoulder belt end.

4.5.2 *Passenger Seats*—Passenger-seat frames and seat-back frames designed to provide anchorages for seat belts shall be constructed and anchored to the vehicle structure that supports them to sustain an additional forward static load not less than 2,500 pounds for each lap belt end attached.

4.6 *Test Procedures*

4.6.1 Testing of front seats shall be in accordance with SAE J879; testing of intermediate and rear seats shall be accomplished by applying similar procedures.

- 4.6.2 Testing of seats designed to provide seat-belt anchorages shall be in accordance with SAE J787.

NOTE: Some energy absorption under impact can be obtained through deflection of the seat back. Therefore, some deflection and permanent set of the seat back consistent with rigidity requirements and normal occupant accommodations is permissible.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

1 November 1966.

STANDARD
for
FOUR-WAY FLASHER
for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard describes a driver-controlled system of vehicle warning lights that will cause all turn-signal lamps to flash simultaneously and indicate to approaching drivers the presence of a road hazard.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:
- 2.1.1 *Society of Automotive Engineers (SAE)*
J910, Recommended Practice for Vehicular Hazard Warning Signal Operating Unit
J945, Automotive Flashers
- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
- Passenger cars
Station wagons
Buses and school buses
Light trucks and standard commercial trucks

4. *Detail Requirements*

- 4.1 Components and tests for this Standard shall be in accordance with SAE J910, except that the flasher shall be tested in accordance with SAE J945.
- 4.2 *Life Test Requirement*—The flasher, with maximum lamp load to be used on the vehicle, shall be subjected to a test of 50 hours duration during which the flasher shall be operated 12 hours and allowed to rest 40 minutes, and this cycle repeated for the remainder of the test period.

5. *Notes*

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4 Canada.

97-GP-8

1 November 1966.

STANDARD

for

SAFETY GLAZING MATERIALS

for AUTOMOTIVE VEHICLES

1. Definition

- 1.1 This standard establishes requirements for safety glazing materials for automotive vehicles.

2. Applicable publications

- 2.1 The following publication is applicable to this standard:
 - 2.1.1 *United States of America Standards Institute (USASI*)*
Z26.1, Safety Code for Safety Glazing Materials for Glazing Motor Vehicles Operating on Land Highway.
- 2.2 Reference to the above publication is to the latest issue, unless otherwise specified.

3. Applicability

- 3.1 This standard applies to:
 - Passenger cars
 - Station wagons
 - Buses and school buses
 - Light trucks and standard commercial trucks.

4. Detail Requirements

- 4.1 Safety glass used in the windshields, windows, doors and other glazed openings in vehicles covered by this Standard shall comply with the requirements of USASI Z26.1.
- 4.2 Windshields shall be glazed with laminated safety glass.

5. Notes

- 5.1 The publication listed in Section 2 is available from the CGSB Secretary.

*Formerly American Standards Association (ASA)

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, Department of Defence Production, Ottawa 4, Canada.

97-GP-9

1 November 1966

STANDARD

for

DUAL BRAKE SYSTEM

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for dual (split) hydraulic or dual air service brake systems installed in automotive vehicles.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:

- 2.1.1 *Society of Automotive Engineers (SAE)*
J843, Standard for Brake System Road Test Code for Passenger Cars
J937, Standard for Service Brake Performance Requirements of Passenger Cars
- 2.1.2 Uniform Vehicle Code of the United States National Committee on Uniform Laws and Ordinances.
- 2.2 Reference to the above publications is to the latest issue unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:

Passenger cars
Station wagons
Buses and school buses
Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 *Service Brake System Performance*—The performance ability of the fully operational service brake system for passenger cars and station wagons shall be not less than that described in SAE J937 and J843. The performance ability of the fully operational service brake system for buses and light trucks up to 10,000 pounds GVW shall be not less than that described in Section 12-392 of the Uniform Vehicle Code.
- 4.2 *Design*—The service brake system shall be of such design that rupture or failure of an actuating-pressure component in the system shall not result in complete loss of function of the service brake system. Mechanical linkage or other means of brake application may

be utilized to meet this requirement provided that continuation of the same motion on the same brake pedal used to actuate the normal system applies or actuates the braking force. The hydraulic fluid system shall be sealed to protect the brake fluid from outside contamination.

NOTE: Actuating-pressure components are defined as: the brake master cylinder or master control unit, wheel brake cylinder, brake line, brake hose or equivalent.

- 4.3 *System Effectiveness Indicator*—Failure of the system shall be indicated by means of an electrically operated red light mounted on the instrument panel. The light shall have an area of not less than 0.196 square inch. It shall light up before or upon application of the brakes when an actuating-pressure component of the system has sustained a loss of pressure. The indicator light system shall include a means for the vehicle operator to assure that the light system is operational.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97—GP—10

1 November 1966.

STANDARD

for

HEIGHT AND EXTENSION OF BUMPERS
for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes the height for contact surfaces of front and rear bumpers and guards for automotive vehicles, to provide protection against damage due to vehicle-to-vehicle contact, such as in parking operations.

2. *Applicable Publications*

Nil.

3. *Applicability*

- 3.1 This standard applies to:

Passenger cars
Station wagons
Pick-up trucks

4. *Detail Requirements*

- 4.1 When the vehicle is loaded, front and rear bumpers and guards shall present a contact line between the wheel treads within a 1-inch band enclosed between the heights of 17 and 18 inches above the road level. A "loaded" vehicle is defined as the "curb weight" plus "accessory weight" (see 5.1) plus 150 pounds for each passenger, distributed as two passengers in the front seat and one passenger in the rear seat. (See 5.2.)
- 4.2 Bumpers and guards shall extend beyond the projections of any lights. Compliance with this requirement may be determined by bringing the exterior face of the bumpers and guards into contact with a vertical surface and assuring that no contact is made between any light and the vertical surface.

5. *Notes*

- 5.1 *Curb weight* is defined as the weight of the vehicle with standard equipment including the maximum capacity of engine fuel, oil and coolant, and air conditioning and optional engine weights if so equipped.

Accessory weight—consists of automatic transmission; power-operated steering, brakes, windows and seats; radio and heater whether present or not.

- 5.2 In vehicles having hydro-pneumatic, hydraulic, air pressure suspension, or automatic load-levelling devices, the contact line shall be measured when the engine is in operation.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97—GP—11

1 November 1966.

STANDARD

for

STANDARD GEAR QUADRANT (P R N D L)

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for the lever-controlled sequence of shifting mechanisms for automatic transmissions installed in automotive vehicles.

2. *Applicable Publications*

- 2.1 Nil.

3. *Applicability*

- 3.1 This standard applies to:
Passenger cars
Station wagons
Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 *Sequence*—The sequence of the lever-control mechanism when viewed from the driver's seat in the clockwise order shall be:

Park (P)
Reverse Drive (R)
Neutral (N)
Forward Drive (D)
Low Forward Drive (L)

Neutral shall be positioned between forward-drive and reverse-drive positions, and in no case shall any forward-drive position be adjacent to any reverse-drive position.

- 4.2 *Low Forward-Drive Braking Effect*—When selected and engaged, the low forward drive position shall provide a braking effect upon deceleration, and the transmission shall be so designed that automatic upshift through the transmission range is blocked effectively for all speeds and loads within the speed range up to and including 25 miles per hour.

- 4.3 *Park Position*—The transmission lever-control sequence mechanism of passenger cars and station wagons may be provided with a park position. When so provided and engaged, it shall initiate a positive

lock for the purpose of preventing the drive wheels of the vehicle from moving.

- 4.4 *Safety Feature*—Automatic transmissions, whether installed in passenger cars or trucks, shall have the starting circuit so connected that it is impossible to start the engine unless the transmission is in the "park" or "neutral" position.

97-GP-12

1 November 1966.

STANDARD

for

WINDSHIELD WIPERS AND WASHERS

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for windshield wiping and washing systems to be installed in automotive vehicles.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:
 - 2.1.1 Society of Automotive Engineers (SAE)
 - J826, Manikins for Use in Defining Vehicle Seating Accommodation
 - J903, Passenger Car Windshield Wiper Systems
 - J941, Passenger Car Driver's Eye Range
 - J942, Passenger Car Windshield Washer Systems
- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
 - Passenger cars
 - Station wagons
 - Buses and school buses
 - Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*4.1 *Windshield Wipers*

- 4.1.1 Windshield wipers shall comply with SAE J903.
- 4.1.2 The windshield wiper system shall be driven by a motor, actuated by a conveniently located control with which the driver of the vehicle may vary the speed of the wipers. The windshield wiper blades, when in the parked position, shall be clear of the vision area.
- 4.1.3 The windshield wiper system shall be designed to provide two or more speeds and each speed shall be constant regardless of engine load.

4.2 *Windshield Washer System*

- 4.2.1 Windshield washer systems shall comply with SAE J942.

- 4.2.2 The windshield washer system shall include a container holding at least 48 ounces of usable fluid.
- 4.2.3 The container shall be made of such material that it will not fracture or break if the fluid freezes.
- 4.2.4 The fluid shall be applied to the outside of the windshield in a suitable pattern under a reasonable range of vehicular operating conditions so that the windshield wipers will perform effectively in accordance with SAE J942.
- 4.3 *Wiped Area*—The following requirements for minimum area to be wiped shall apply to passenger cars, station wagons and light trucks only.
 - 4.3.1 The requirements for area to be wiped are based on and established for high-speed wiper operation, a wet windshield, and a minimum relative air speed of 70 miles per hour. The boundaries of the minimum wiped area shall be established on the windshield by planes originating from the 95th percentile tangential cutoff two-dimensional eye-range contours in accordance with SAE J941. With the driver's seat in the rearmost position, the glazing surface reference line (Figure 1) is the line of intersection of the glazing surface and a horizontal plane 25 inches above the "H" point (SAE J826). The plan view reference line (Figure 2) is the line outboard of the steering wheel centerline, and is parallel to the vehicle centerline at a distance 0.15 of the dimension from the steering wheel centerline to the left-hand extremity of shoulder room. This dimension can be determined by taking 0.50 of the shoulder-room dimension, minus the distance from steering-wheel centerline to centerline of car, multiplied by 0.15 (Figure 2).
 - 4.3.2 The minimum area requirements are defined by the use of three specific areas (A, B and C of Table 1) on the windshield glazing surface. Referring to Figure 1, the upper and lower boundaries of each area shall be established by the intersection of two planes, tangential to the upper and lower sides of the eye-range contour, with the windshield glazing surface. The planes shall be fixed by angles above (angle Y) and below (angle Z) the glazing surface reference line. Referring to Figure 2, the left and right boundaries of each area shall be established by the intersection of two planes tangential to the sides of the left and right eye-range contours. The planes shall be fixed by angles to the left (angle W) and right (angle X) of the plan view reference line. Table 1 provides the minimum angular dimensions that establish the boundaries for areas A, B and C.
 - 4.3.3 Area A in Table 1 is the largest specified portion of the windshield glazing surface, and not less than 80 per cent of this area shall be cleanly wiped. Area B of Table 1 is a smaller area providing a broad horizontal band across the windshield glazing surface. Area B shall be cleanly wiped over not less than 95 per cent of its total area. These allowances are made in recognition of the geometry of modern wiper systems. Area C in Table 1, the smallest area directly in front

of the vehicle operator, shall be cleanly wiped over 100 per cent of its total area. In no instance shall there be an unwiped area at or near the horizontal center of the windshield, produced by either a tandem or an opposed system, that extends below the glazing surface reference line. The left windshield wiper blade shall, at any point, wipe to within 2 inches of the left corner "A" post.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

FIGURE 1.—Side view.

TABLE I

Area	Percent wiped area	Angles

97-GP-13
STANDARD
for
GLARE-REDUCTION SURFACES
of AUTOMOTIVE VEHICLES

1 November 1966.

1. Definition

- 1.1 This Standard establishes glare and reflection limits for vehicle components within the operator's field of view, to achieve the most practical reduction of distracting reflectance.

2. Applicable Publications

- 2.1 The following publications are applicable to this Standard:

2.1.1 *American Society for Testing and Materials (ASTM):*

D307, Method of Test for Spectral Characteristics and Color of Objects and Materials.

D523, Method of Test for Specular Gloss

D791, Method of Test for Luminous Reflectance, Transmittance, and Color of Materials

D1535, Method of Specifying Color by the Munsell System

E97, Method of Test for 45-degree and 0-degree Directional Reflectance of Opaque Specimens by Filter Photometry.

2.1.2 *Society of Automotive Engineers (SAE):*

J941, Passenger Car Driver's Eye Range

- 2.2 Reference to the above publications is to the latest issues, unless otherwise specified.

3. Applicability

- 3.1 This standard applies to:

Passenger cars

Station wagons

Buses and school buses

Light trucks and standard commercial Trucks.

4. Detail Requirements

4.1 Definition

- 4.1.1 *Field of View*—With the operator's seat in the rearmost position, the operator's field of view is the area forward of a lateral vertical plane located tangential to the rearmost boundary of the 99th percentile eyerange contour of SAE J941, and extending to the area behind the

"A" post back to the side windows. Behind the "A" post, glare reduction may be limited to bright metal surfaces around, inside, and outside-adjacent to the windows of the vehicle. The area below the instrument panel is excluded.

4.1.2 *Glare*—Glare is the visual effect of any source of light in the field of vision that either dilutes or competes with the field of view on which the driver's attention is being focused.

4.1.3 *Specular Gloss*—Specular gloss is the luminous fractional reflectance of a specimen at the specular direction.

4.1.4 *Luminous Directional Reflectance*—Luminous directional reflectance is the ratio of flux reflected to that from a perfect diffuse reflector similarly illuminated and viewed.

4.1.5 *Saturation* (Munsell Chroma)—Saturation is the attribute of color perception that expresses the degree of departure from gray of the same lightness. (All grey colors have zero saturation.)

4.2 *Detail Requirements*

4.2.1 *Instrument Panels*

4.2.1.1 The specular gloss of the surface of the material used for instrument-panel top surfaces and appurtenances shall not exceed 30 units when measured by the 85-degree (ASTM D523) or equivalent method.

4.2.1.2 The luminous directional reflectance of the surface of the material used for instrument-panel top surfaces shall not exceed 30 per cent (which is equivalent to a Munsell value of less than 6.0/—) when measured in accordance with ASTM D307, D791, D1525, E97 or equivalent method.

4.2.1.3 The saturation (Munsell Chroma) of instrument-panel top surfaces shall be not more than $\frac{1}{6}$, when measured in accordance with (ASTM D1535) or equivalent method.

4.2.2 *Windshield Wiper Arms and Blades*—The specular gloss of the surface of the material used for windshield wiper arms and blades shall not exceed 40 units when measured by the 20-degree ASTM D523 or equivalent method.

4.2.3 *Other Surfaces*—The specular gloss of the surface of the material used for instrument bezels, windshield molding, control devices, horn ring, inside and outside rearview mirrors and mounting hardware, trim hardware, etc., in the operator's field of view, shall not exceed 40 units when measured by the 20-degree (ASTM D523) or equivalent method.

4.3 Instruments, control devices, etc., shall present a minimal reflection into the windshield under day and night driving conditions.

5. Notes

5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-14
STANDARD
for
TIRES AND RIMS
for AUTOMOTIVE VEHICLES

1 November 1966.

1. *Definition*

- 1.1 This standard establishes requirements for tires and rims for automotive vehicles.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this Standard:
- 2.1.1 *Society of Automotive Engineers (SAE)*
J918, Passenger Car Tire Performance Requirement and Test Procedures
- 2.1.2 Canadian Government Specifications Board (CGSB) 20-GP-5, Tires: Pneumatic, Vehicle and Mobile Ground Equipment.
- 2.1.3 The Tire and Rim Association (TRA) Year Book 1965-66.
- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
- Passenger cars
Station wagons
Buses and school buses
Trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 *Tires*—Tires supplied for use on automotive vehicles shall comply with the requirements of CGSB 20-GP-5.
- 4.1.1 *Rated Capacity*—At the inflation pressure recommended by the vehicle manufacturer, each tire shall have a rated capacity at least equal to the total load on each axle divided by the number of tires on the axle. This capacity shall be in accordance with the TRA Year Book, provided that the inflation pressure does not exceed the maximum stipulated for the size and ply-rating of the tire furnished.
- 4.1.2 A "fully loaded" vehicle shall include the indicated weights as follows:

- 4.1.2.1 *Passenger cars*—curb weight (5.1) plus accessory weight (5.2), plus 150 pounds for each of the rated number of passengers, plus 200 pounds trunk load.
- 4.1.2.2 *Station Wagons*—curb weight (5.1) plus the accessory weight (5.2), plus 150 pounds for each of the rated number of passengers, plus 300 pounds distributed load.
- 4.1.2.3 *All other vehicles*—the fully specified gross vehicle weight distributed as closely as possible to load each axle to its rated capacity.
- 4.2 *Rims for Passenger Cars and Station Wagons*—Automotive vehicles shall be equipped with rims conforming to, or wider than, the minimum widths listed in the TRA Year Book for the size and ply-rating of the tire furnished.
- 4.2.1 In the event of rapid loss of inflation pressure with the vehicle traveling in a straight line at a road speed of 60 miles per hour, the rim shall retain the deflated tire until the vehicle can be stopped by controlled braking (5.3).
- 4.3 *Resistance to Tire Bead Unseating—Passenger Cars and Station Wagons*—When tested in accordance with SAE J918, the applied force required to unseat the tire bead at the point of contact shall be not less than 2,500 pounds.

5. Notes

- 5.1 *Curb weight* is defined as the weight of the vehicle with standard equipment including the maximum capacity of engine fuel, oil and coolant; and air conditioning and optional engine weights if so equipped.
- 5.2 *Accessory weight*—consists of automatic transmission; power steering, brakes, windows and seats; radio and heater whether present or not.
- 5.3 For test purposes, an explosive device may be used to induce rapid loss of inflation pressure.
- 5.4 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-15

1 November 1966

STANDARD

for

BACK-UP LIGHTS

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for an automotive vehicle back-up light system, to warn pedestrians and drivers of approaching vehicles that the vehicle may move or is moving in reverse direction, and to provide illumination to the rear.

2. *Applicable Publications*

- 2.1 The following publication is applicable to this standard:
- 2.1.1 *Society of Automotive Engineers*(SAE)
J593, Back-Up Lamps
- 2.2 Reference to the above publication is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
- Passenger cars
Station wagons
Light trucks up 10,000 lb. GVW.

4. *Requirements*

- 4.1 The back-up light system shall consist of two white lamps that, when the ignition is on, shall light up automatically whenever the vehicle transmission is in the reverse gear.
- 4.2 The back-up light system shall conform to the requirements of SAE J593.

5. *Notes*

- 5.1 This standard should also be considered for buses, school buses, and standard commercial heavy trucks and truck units.
- 5.2 The publication listed in Section 2 is available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-16

1 November 1966

STANDARD

for

REARVIEW MIRRORS

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for rearview mirrors for automotive vehicles to provide the driver with reasonably unobstructed vision to the rear and in adjacent traffic lanes.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:

- 2.1.1 *Society of Automotive Engineers (SAE)*
J826, Manikins for Use in Defining Vehicle Seating Accommodation
J941, Passenger Car Driver's Eye Range
J964, Test Procedure for Determining Reflectivity of Rearview Mirrors

- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:

Passenger cars
Station wagons
Bus and school buses
Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 *Mirror Construction*—The reflective medium shall be of a material that will resist abrasion and erosion incident to accepted cleaning practices. The surfaces of the material shall be finished to provide and maintain a distortion-free reflected image. Front or second-surface reflectance may be used. The reflectance value of the reflective film employed shall be not less than 50 per cent. Inside mirrors may be of the selective position prismatic type, in which case the reflectance value in the night-driving, high-glare position shall be not less than 4 per cent.
- 4.2 *Reflectance Value*—The reflectance value of inside and outside rear-view mirrors shall meet the requirements of SAE J964.

4.3 *Inside Mirrors*

4.3.1 *Size*—The rearview mirror shall have a horizontal dimension that will provide the driver with a view to the rear of the vehicle with a horizontal angle of not less than 20 degrees. The vertical angle of rear vision shall be at least sufficient to provide a view of the road surface beginning at a point not more than 200 feet to the rear of the vehicle, and continuing to the horizon, under conditions of a level road and with the vehicle occupied by the driver and rated number of passengers in the case of passenger cars and station wagons, or loaded to gross vehicle weight in the case of buses and light trucks where inside mirrors may be applicable.

4.3.2 *Location*—The rearview mirror shall be mounted on the inside of the vehicle to provide the driver with a stable, readily distinguishable image under normal road conditions. The mirror shall be located as far forward in the vehicle as the windshield, mount, and adjusting device will permit (buses excepted) and above the upper 95th percentile tangential cutoff of the eye range contour (SAE J941). Deviations in vertical positioning will be permitted when required to meet the vertical field of view requirements to the rear. Extra large bus mirrors designed to serve the additional purpose of passenger surveillance shall be located with due consideration of the preceding requirements.

4.3.3 *Mounting*

4.3.3.1 The mirror shall be mounted in the vehicle by means of a suitable supporting assembly of sufficient strength to provide a stable support for the mirror, and shall be of a design that will minimize injury potential to occupants. The rim of the mirror or its supporting bezel shall have an edge radius of not less than 0.125 inch unless constructed of force-distributing materials. The mount shall provide for universal adjustment of the mirror to accommodate any size of driver in any available seat position; if in the head impact area, the mount shall be designed to break away or collapse upon the application of a force not exceeding 90 pounds, in the direction applied by the head of a seat-belted occupant. Rigid mounts shall break without leaving protruding residuals.

4.3.3.2 The head impact area shall be established through the use of 97-GP-1 Type 1 seat belt restrained manikins or other test devices having "H" point (SAE J826) to top-of-head dimensions of 33 inches and 29 inches. Adjustable seats shall be in the extreme forward-driving or riding position for the indicated 33-inch device and in the extreme rearward position for the indicated 29-inch device. The head impact area shall be that included between the arcs formed by the top-of-head point when each device is swung forward and also 45 degrees to each side of the longitudinal axis through each designed seating position.

4.4 *Outside Mirrors*

4.4.1 *Size*—The outside mirror reflecting surface shall have a minimum nominal diameter of 5 inches if of circular design. Rectangular

mirrors shall have a minimum nominal horizontal dimension of 5 inches and a vertical dimension sufficient to provide the driver with a view of the road surface beginning at a point not more than 35 feet to the rear and continuing to the horizon on a level road under all load conditions. The 35 feet shall be measured from the forward position of the 95th percentile tangential cutoff of the eye range contour (SAE J941) to the reflecting surface, then to the roadway to the rear of the vehicle.

4.4.2 *Mounting*—The outside rearview mirror shall be mounted on the left outside of the vehicle to provide the driver with a stable, readily distinguishable image under normal road conditions and with not more than 60 degrees combined head and eye movement. For buses with conventional truck chassis, a combined head and eye movement not exceeding 90 degrees shall be permitted. The outside mirror shall provide the operator, with seat in full forward position, a view of the side of the vehicle on which it is mounted. The mirror shall not be obscured by the unwiped portion of the windshield or by the corner pillar. The mirror shall be readily adjustable to accommodate different sized drivers, seat positions and load conditions. The mirror and mount shall be designed, constructed, located and mounted to minimize pedestrian injury.

4.4.3 *Additional Outside Rearview Mirror*—Station wagons, buses and trucks shall be provided with an additional outside rearview mirror to provide driver vision to the right rear areas adjacent to the vehicle that may be obscured by vehicle design or load conditions. The visual characteristics of the right outside mirror shall conform to the requirements for the left outside mirror except that the restrictions on combined head-and-eye movement may be relaxed to the extent dictated by vehicle design. Design, construction, location and mounting requirements of the right outside mirror shall be as close as possible to those for the left outside mirror except that, where necessary, consideration may be given to location and mounting problems dictated by vehicle design.

4.5 *Wide-Angle Mirror*

4.5.1 When specified, an auxiliary wide-angle (convex) mirror may be incorporated in or on the same mount as the standard mirror to provide an additional close in field of vision required under certain operating conditions.

4.5.2 The auxiliary mirror shall not interfere with the visual field of the standard mirror.

5. Notes

5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-17

1 November 1966

STANDARD

for

REAR WINDOW VISION AID

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for the performance of a fog prevention or removal device designed to achieve the most effective vision through the rear window.

2. *Applicable Publications*

- 2.1 The following publication is applicable to this standard.
 - 2.1.1 *Society of Automotive Engineers (SAE)*:
J953, Passenger Car, Back Light Defogging System.
 - 2.2 Reference to the above publication is to the latest issues, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to passenger cars except convertibles and station wagons.

4. *Detail Requirements*

- 4.1 Each vehicle shall be permanently equipped with a device to ensure that not less than 75 per cent of the inside of the rear window area will remain free from frost and fog when the vehicle, with windows closed, containing the rated passenger load is driven one hour at any speed, in air at 0°F and 90 per cent relative humidity.

4.2 *Testing*

Testing of the defogger system shall be in accordance with SAE J953.

5. *Notes*

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-18
STANDARD
for
WINDOW AND DOOR CONTROLS
for AUTOMOTIVE VEHICLES

1 November 1966.

1. Definition

- 1.1 This standard establishes the requirements for the location and construction of the controls for windows and doors of automotive vehicles.

2. Applicable Publications

- 2.1 The following publications are applicable to this Standard:
- 2.1.1 *Society of Automotive Engineers (SAE)*
J826, Manikins for Use in Defining Vehicle Seating Accommodation
 - 2.1.2 United States Public Health Service Publication No. 1000, Series 11, Number 8.
- 2.2 Reference to the above publications is to the latest issues, unless otherwise specified.

3. Applicability

- 3.1 This standard applies to:
- Passenger cars
 - Station wagons
 - Light trucks up to 10,000 lb. GVW.

4. Detail Requirements

- 4.1 Injury potential shall be minimized by constructing, locating and mounting the controls to reduce the likelihood of injury to the head, torso and legs of occupants restrained by 97-GP-1 Type 1 seat belts in rear and front seats.
- 4.2 *Impact Areas*
- 4.2.1 SAE J826 forms a basis for this standard pertaining to head, knee, and leg impact areas.
 - 4.2.2 The head impact area shall be established using manikins restrained by a 97-GP-1 Type 1 seat belt, or other test devices, having "H" point to "top-of-head" dimensions of 33 and 29 inches. Adjustable seats shall be in the extreme forward driving or riding position for the indicated 33-inch device and in the extreme rearward position for the indicated 29-inch device. The head impact area is the area

between the arcs formed by the "top-of-head" points with the devices placed at each designed seating position and then swung forward and at least 90 degrees to each side of the longitudinal axis or as far as the vehicle body structure will permit.

- 4.2.3 The knee and leg impact areas on the doors shall be established by swinging the manikin's knees and legs 45 degrees right and left, or as far as the vehicle body structure will permit, with the seat in its rearmost position, using a manikin restrained by a Type 1 seat belt, with leg dimensions of the normally seated 95th percentile male defined in U.S. Public Health Service Publication No. 1000, Series 11, Number 8, or other test device.
- 4.2.4 Impact areas in all portions of the windows and doors that may be contacted, shall be determined by swinging the manikin's knees and legs 45 degrees right and left, or as far as the vehicle body structure will permit, at each outboard designed seating position with the manikin's "H" point moved horizontally forward 10 inches and its feet resting in their normal toe board position.
- 4.3 The controls shall be located within reach of the seat-belted occupant nearest the door. Controls located away from or shielded from the impact area, or recessed within the panel or armrest in such a manner as to reasonably minimize the likelihood of contact by occupants, shall be considered to provide an acceptable degree of protection.
- 4.4 Door handle controls not meeting 4.3 shall be constructed so as to have a contact area of not less than 2 square inches, substantially vertical, with minimum radii of 0.125 inch. Window control knobs not meeting 4.3 shall have a minimum contact area of not less than 1 square inch, with minimum edge radii of 0.125 inch. All controls shall have a maximum extension from the panel of 1 inch, except that force-distributing material covering the controls may extend beyond the 1 inch dimension.
- 4.5 Controls not meeting 4.3 or 4.4 shall be constructed of material that will deflect within 1 inch of the panel, or be detached by a force of 90 pounds leaving no residual protrusions beyond the panel surface on which they are mounted.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-19

1 November 1966.

STANDARD

for

ASH TRAYS AND LIGHTERS
FOR AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for ash trays and lighters in automotive vehicles, including their convenient location and safe construction, to provide protection for front- and rear-seated occupants wearing 97-GP-1. Type I. seat belts.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:
 - 2.1.1 *Society of Automotive Engineers (SAE)*
J826, Manikins for Use in Defining Vehicle Seating Accommodation.
 - 2.1.2 United States Public Health Service Publication No. 1000,
Series 11, Number 8 — Weight, Height, and Selected Body
Dimensions of Adults.
- 2.2 Reference to the above publications is to the latest issue, unless other specified.

3. *Applicability*

- 3.1 This standard applies to:
Passenger cars
Station wagons
Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 *Construction, Location and Mounting*
 - 4.1.1 Ash trays and lighters shall be constructed, located and mounted so as to minimize injury to the occupant's head, torso and legs upon impact.
- 4.2 *Provision, Location and Construction*
 - 4.2.1 Where feasible, ash trays shall be provided for each outboard passenger of front and rear seats, readily accessible, and within the reach of a 95 percentile male manikin restrained by a 97-GP-1, Type I seat belt, with the front seats in the mid-riding or driving position.

- 4.2.2 Ash trays and lighters shall be shielded, located away from the impact area, or recessed to minimize the likelihood of contact by the head, torso, or legs of occupants wearing 97-GP-1, Type I seat belts.
- 4.2.3 Open ash trays with lighters not meeting 4.2.2 shall have a contact area of not less than 1.0 square inch in the direction of impact and shall have minimum edge radii of 0.125 inch. Such ash trays and lighters shall either deflect or recede to within 0.375 inch of the mounting or be detachable by a force not exceeding 45 pounds.

4.3 Impact Area

- 4.3.1 The head impact area shall be established by using manikins restrained by a 97-GP-1, Type I seat belt, or other test devices, having "H" point to "top-of-head" dimensions of 33 and 29 inches (SAE J826). Adjustable seats shall be in the extreme forward-driving or riding position for the indicated 33-inch device and in the extreme rearward position for the indicated 29-inch device. The head impact area is the area between the arcs formed by the "top-of-head" points with the devices placed at each designed seating position and then swung forward and at least 90 degrees to each side of the longitudinal axis, or as far as the vehicle body structure will permit. The knee and leg impact areas on the doors shall be established by swinging the manikin's knees and legs 45 degrees right and left, or as far as the vehicle body structure will permit, with the seat in its rearmost position, using manikins restrained by a 97-GP-1, Type I seat belt, with leg dimensions of the normally seated 95 percentile male manikin as described in U.S. Public Health Service publication, or by other test devices.
- 4.3.2 Impact areas in all portions of the instrument panel and doors that may be contacted shall be determined by swinging the manikin's knees and legs 45 degrees right and left, or as far as the vehicle body structure will permit, at each designed seating position with the manikin's "H" point moved horizontally forward 10 inches and its feet resting in their normal toe board position.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Dept. of Defence Production, Ottawa 4, Canada.

97-GP-20
1 November 1966.
STANDARD
for
ARM RESTS
for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for arm rests installed in automotive vehicles, to afford a reasonable degree of protection for front- and rea-seated occupants wearing 97-GP-1 Type 1 seat belts.

2. *Applicable Publications*

- 2.1 The following publication is applicable to this standard:
- 2.1.1 *Society of Automotive Engineers (SAE)*:
J826, Manikins for Use in Defining Vehicle Seating Accommodations
- 2.2 Reference to the above publication is to the latest issue, unless otherwise specified.

3. This Standard applies to:

Passenger cars
Station wagons
Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*

- 4.1 Arm rests shall be constructed and mounted so as to minimize force and spread the area of impact by the occupant, under collision conditions.
- 4.2 *Location and Construction*
- 4.2.1 The innermost exposed surface of the arm rests shall be substantially vertical. In any normal position of the seat, the substantially vertical surface of the arm rest shall provide an area of broad contact with the pelvic region of not less than 2.0 inches vertically. The top and sides of the arm rests shall be constructed of flexible material or covered with force-distributing material at least 0.5-inch thick. The arm rests shall not have any sharp, narrow or protruding rigid edges in the impact area, either exposed or under the force-distributing material. The top and sides of the mounting bracket shall not have any rigid edges of less than 0.75 inch radius. If arm rests break upon impact, no sharp or jagged edges shall remain.

- 4.2.2 When constructed of flexible or foam-like material, the arm rests shall deflect to within 1.25 inches of the panel surface without permitting contact with any rigid material. Any rigid material between 0.5 and 1.25 inches from the panel surface shall have a minimum vertical height of not less than 1.0 inch. Upper and side edges of rigid material shall have a radius of not less than 0.75 inch.
- 4.2.3 Accessories or equipment attached to the arm rests shall meet the safety requirements applicable to such equipment or accessories and shall not nullify the injury-reducing characteristics specified for arm rests.

4.3 Impact Areas

- 4.3.1 The head impact area shall be established by using manikins restrained by a 97-GP-1 Type 1 seat belt, or other test devices, having "H" point (SAE J826) to "top-of-head" dimensions of 33 and 29 inches. Adjustable seats shall be in the extreme forward-driving or riding position for the indicated 33-inch device and in the extreme rearward position for the indicated 29-inch device. The head impact area is the area between the arcs formed by the "top-of-head" points with the devices placed at each designed seating position and then swung forward and at least 90 degrees to each side of the longitudinal axis, or as far as the vehicle body structure will permit. The knee and leg impact areas shall be established by swinging the manikin's knees and legs 45 degrees right and left, or as far as the vehicle body structure will permit, with the seat in its rearmost position, using manikins restrained by a 97-GP-1 Type 1 seat belt and with leg dimensions of the normally seated 95th percentile male or other test device.
- 4.3.2 Impact areas in all positions that may be contacted, shall be determined by swinging the manikin's knees and legs 45 degrees right and left, or as far as the vehicle body structure will permit at each designed seating position, with the manikin's "H" point moved horizontally forward 10 inches and with its feet resting in their normal toe board position.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4 Canada.

97-GP-21

1 November 1966.

STANDARD

for

PADDED SEAT-BACKS

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for seat-back frames constructed to absorb and dissipate energy imparted to the top and back, in the event of collision, by the upper torso, limbs and head of forward-facing passengers restrained by lap belts.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:

2.1.1 *Society of Automotive Engineers (SAE)*

J826, Manikins for Use in Defining Vehicle Seating Accommodation

J921, Instrument Panel Laboratory Impact Test Procedure

2.1.2 US Public Health Service Publication No. 1000, Series 11, Number 8.

- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:

Passenger cars

Station wagons

School buses Light Trucks up to 10,000 lb. GVS, with provision for forward-facing passenger seating within the cab in rear of the front seat.

- 3.2 The guardrail behind the driver's seat, and the grabrail behind or beside the service door in school buses, shall be considered as seat-back frames for the purpose of this standard.

4. *Detail Requirements*

- 4.1 The top and back of the front seats of passenger cars, the top of the back of forward-facing seats (except the rear-most seat) in station wagons, the top and back of all forward-facing seats in school buses (except the driver's seat and the rear-most seats) and the guardrail behind the driver's seat in school buses, shall be constructed and

padded with impact-absorbing material to minimize force build-up and to spread the area of contact by the impacting human body.

- 4.2 The guardrails, grabrails, and applicable areas of vertical stanchions shall contain no sharp nor protruding areas, and shall be constructed of or covered with at least 0.5-inch thick force-distributing cushioning material or other material that will reduce the likelihood of injury to the occupant upon impact.

4.3 Impact Areas

- 4.3.1 The head impact area is established by using manikins restrained by a 97-GP-1 Type 1 seat belt, or other test devices, having "H" point (SAE J826) to "top-of-head" dimensions of 33 and 29 inches. For school buses the "H" point to "top-of-head" dimensions shall be 33 and 21 inches. The head impact area is the area between the arcs formed by the "top-of-head" points with the devices placed at each designed seating position and then swung forward and at least 45 degrees to each side of the longitudinal axis, or as far as the vehicle body structure will permit.
- 4.3.2 The knee and leg impact areas are established by swinging the manikin's knees and legs 45 degrees right and left, or as far as the vehicle body structure will permit, using manikins restrained by a 97-GP-1 Type 1 seat belt and with the "H" point moved horizontally forward 10 inches, or other test devices, with leg dimensions of the normally seated 95th percentile male defined in U.S. Public Health Service Publication No. 1000, Series 11, No. 8.
- 4.4 *Test Procedures*—For test purposes, seat spacing in school buses shall be 27 inches. Spacing from the driver's guardrail, and from the modesty panel, to the front of the nearest seat cushion shall be 12 inches. Tests shall be in accordance with SAE J921, except that the vertical plane of the impacting normally seated device, while facing straight ahead, shall be rotated 45 degrees to the left and right. When the head form is impacting the seat back at 22 feet per second, the deceleration of the head form shall not exceed 80 g's excluding all portions of the deceleration time curve above the 80 g level of less than 1.0 millisecond duration. The "less than 1.0 millisecond" time of duration shall be that measured at the 80 g level of the deceleration time curve.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-22
STANDARD
for
HEADRESTS FOR FRONT SEATS
of AUTOMOTIVE VEHICLES

1 November 1966.

1. Definition

- 1.1 This standard establishes the requirements for front-seat headrests in passenger cars to afford a reasonable degree of protection from neck injury (whiplash) in the event of a rear-end collision.

2. Applicable Publications

- 2.1 The following publications are applicable to this standard:
- 2.1.1 Canadian Government Specifications Board (CGSB) 97-GP-21, Padded Seat Backs for Automotive Vehicles
- 2.1.2 *Society of Automotive Engineers* (SAE) J826, Manikins for Use in Defining Vehicle Seating Accommodation
- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. Applicability

- 3.1 This standard applies to:
- Passenger cars
Station wagons

4. Detail Requirements

4.1 Definition

- 4.1.1 *Headrest or Head Restraint* - A headrest or head restraint is defined as a well-padded area associated with a seat back for restraining rearward movement of the head.
- 4.2 A head-restraining device (headrest) shall be provided for each outboard front seat position. The head restraint may be an extension of or an attachment to the seat back. It may be provided with a transversely adjustable mounting.
- 4.3 The minimum width of the head restraint or headrest shall be 10 inches and the average width shall be at least 12 inches, both based on the forward-facing surface that can be contacted by the head of the occupant. The top of the head restraint, in its extreme "up" position if adjustable, shall be tangential to a plane that is perpendicular to the torso line of a two-dimensional manikin (SAE J826) and not

less than 27.5 inches from the "H" point. The forward surface of the head restraint shall be not less than 1.0 inch and not more than 4.0 inches rearward of the torso line, measured on a perpendicular.

- 4.4 The headrest or head restraint, including any supporting structure that can be contacted by the head of an occupant of the vehicle, shall be constructed to meet the requirement of CGSB 97-GP-21.
- 4.5 Structural deflection of the headrest or head restraint resulting from contact in rear-end collisions is allowable, except that rebound action shall be minimized. The headrest or head restraint and its supporting structure shall not fail prior to the failure of the seat back upon which it is mounted.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-23

1 November 1966.

STANDARD

for

SIDE MARKER DEVICES

for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements for side-marker systems to assure notice and recognition of a vehicle from the lateral positions during darkness and inclement weather.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard.
 - 2.1.1 *Society of Automotive Engineers (SAE)*:
J592, Clearance, Side Marker, Identification and Parking Lamps.
J594, Reflex Reflectors
 - 2.1.2 Uniform Vehicle Code of the United States National Committee on Uniform Traffic Laws and Ordinances.
- 2.2 Reference to the above publications is to the latest issues, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies to:
Passenger cars
Station wagons
Light trucks up to 10,000 GVW

4. *Detail Requirements*4.1 *Device Systems*

- 4.1.1 The side-marker system shall consist of either an independent electrical system or an electrical system in combination with or utilizing head and/or tail lamps; or a reflective system; or a combination electrical and reflective system.
- 4.1.2 Side-marker devices, shall conform to the applicable requirements of Chapter 12 of the Uniform Vehicle Code of the National Committee on Uniform Traffic Laws and Ordinances.
- 4.1.3 There shall be at least two devices on each side of a vehicle. One shall be mounted on each side near the front of the vehicle and one on each side near the rear, not less than 16 inches nor more than

28 inches from the ground on an unladen vehicle. Those near the front shall be white to amber and those near the rear shall be red. The side-marker system components shall be visible under normal atmospheric conditions at any time lights are required.

- 4.1.4 Both the front and rear side marker components shall be visible to approaching vehicles from a distance of at least 600 feet to within not less than 100 feet from the marked vehicle. Within this 600- to 100-foot range, the components shall be visible from all positions on each side, beginning at the points where the headlights can just be seen and continuing to the points where the taillights can just be seen.

- 4.2 *Electrical Side-Marker Devices*—Electrical side-marker devices shall be steady-burning simultaneously with the headlights, taillights and parking lights. Photometric measurements shall be in accordance with Section J and Table 1 of SAE J592, and as a minimum shall include test points encompassing the viewing angle described in 4.1.4.

- 4.3 *Reflective Side Marker Devices*—Photometric measurements for reflectors shall be in accordance with SAE J594, except that photometric measurements shall also include appropriate entrance angles encompassing the viewing angle described in 4.1.4. At entrance angles of over 20 degrees, the photometric values shall be not less than for the 20 degree value stated in SAE J594.

- 4.4 *Testing*—Tests shall be in accordance with SAE J592 and J594.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-24
STANDARD
for
ROLL BARS
for AUTOMOTIVE VEHICLES

1 November 1966.

1. *Definition*

- 1.1 This standard establishes requirements for roll bars installed on specific light trucks to afford a reasonable degree of occupant protection in a roll-over.

2. *Applicable Publications*

- 2.1 The following publications are applicable to this standard:
- 2.1.1 Canadian Government Specifications Board (CGSB) 97-GP-1, Restraining Devices and Anchorages for Automatic Vehicles
- 2.1.2 *Society of Automotive Engineers (SAE)*
J826, Manikins for Use in Defining Vehicle Seating Accommodation
J857, Roll-Over Tests Without Collision
- 2.2 Reference to the above publications is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies only to light trucks up to 10,000 lb. GVW of the utility type with open bodies and enclosures made of canvas, aluminum and fiberglass.

4. *Detail Requirements*

4.1 *Construction and Characteristics*

- 4.1.1 The roll bar shall be designed for each manufacturer's product to establish the width, height, clearances, and proper strengths of the structural members required. The roll bar shall be constructed to guard the operator and passenger compartment, or compartments, within a rigidly attached structural bar unit assembly. The strength and size shall be as required for each vehicle type and weight with the specified number of occupants for which the vehicle is designed to be used, and for their maximum protection, without critical deformation or critical encroachment on the operator or passenger compartments.
- 4.1.2 To the extent practicable, the roll-bar structure shall be located to preclude contact by the head of occupants wearing 97-GP-1 Type 1

seatbelts. If this is not possible, the roll bars shall be covered with energy-absorbing cushioning material at least 0.5 inch thick. The roll-bar structure designs shall not impair the vehicle operator's vision or body movements while he is operating the vehicle.

- 4.1.3 Unless otherwise specified, vehicle manufacturers may eliminate a fold-down windshield on the utility truck and incorporate a newly designed fixed windshield strengthened to become part of a roll-bar structure.
- 4.2 *Testing*—Testing shall be in accordance with SAE J857 using the ground level roll-over and the ramp method at a speed of 50 miles per hour. After roll-over, a three-dimensional manikin as specified in SAE J826, with the head probe set at 33 inches above the "H" point, and all adjustable seats in extreme forward-driving position, shall be used to gauge any encroachment. There shall be no encroachment within the 33-inch established height for any designed seating position.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-25

1 November 1966.

STANDARD

for

FUEL TANKS AND TANK FILLER-PIPES

for AUTOMOTIVE VEHICLES

1. Definition

- 1.1 This standard establishes requirements for the integrity and security of fuel tanks and tank filler-pipes in automotive vehicles.

2. Applicable Publications

- 2.1 The following publication is applicable to this Standard.
 - 2.1.1 *Society of Automotive Engineers (SAE)*
J850, Barrier Collision Tests
- 2.2 Reference to the above publication is to the latest issue, unless otherwise specified.

3. Applicability

- 3.1 This standard applies to:
 - Passenger cars
 - Station wagons
 - Buses and school buses
 - All standard commercial trucks

4. Detail Requirements

- 4.1 *Construction and Installation*
 - 4.1.1 Fuel tanks and tank filler-pipes shall be constructed and installed in such a manner as to insure against rupture, total displacement, or discharge of fuel at a rate greater than one ounce per minute, when tested as specified in 4.2.
- 4.2 *Test Procedures*
 - 4.2.1 A front-end longitudinal barrier collision test at 30 miles per hour shall be conducted as specified in SAE J850, with the fuel tank filled to rated capacity.
 - 4.2.2 Rear-end and side collision tests, directed at the centerline of the fuel tank, filled to rated capacity, shall be made using a moving barrier device weighing not less than 4,000 pounds, propelled at 20 miles per hour for a rear-end collision test, and 15 miles per hour for a side collision test on each side of the vehicle.

- 4.2.3 Other testing methods proven to give results equivalent to the SAE J850 test and the moving barrier test may be used.

5. Notes

- 5.1 The publications listed in Section 2 are available from the CGSB Secretary.

Correspondence regarding this Standard should be addressed to Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-26

1 November 1966.

STANDARD

for

OUTSIDE ORNAMENTATION, ACCESSORIES AND PROTRUSIONS
ON AUTOMOTIVE VEHICLES1. *Definition*

This standard establishes the characteristics of protrusions, accessories or ornaments on automotive vehicles that are likely to cause injury by accidental contact with other road users.

2. *Applicable Publications*

Nil

3. *Applicability*

This standard applies to:

Passenger cars

Station wagons

Light trucks up to 10,000 lb. GVW.

4. *Detail Requirements*4.1 *Essential Parts*

4.1.1 Outside rearview mirrors, stands and fastening devices shall not have sharp edges or angles pointing towards the front of the vehicle and shall not present dangerous areas that increase the risk of bodily injury in the case of impact.

4.1.2 Bumper ends shall be bent to the vehicle body and shall not be fitted with pointed protruding parts that constitute risk of injury upon impact.

4.1.3 Outer door handles shall be constructed or recessed to avoid the risk of grazing and injuring other road users.

4.1.4 Outside radio aerials shall be designed to break away on impact.

4.2 *Nonessential Parts*

4.2.1 Visors projecting over the headlights shall have a radius of curvature not less than 0.10 inch or 1/10 of the amount of projection beyond the vertical tangent to the plane of the headlight, whichever is greater.

4.2.2 "Wing indicators" and "flag stands" on the front fenders, as well as fly or snow screens and stands mounted on the hood, must be made of light material and shall be flexible or fitted on springs.

- 4.2.3 Luggage carriers and ski carriers installed on roofs of cars shall have no sharp or sharp-pointed edges.
- 4.2.4 Ornaments or parts mounted on the front end of the vehicle body shall not have sharp angles or dangerous protrusions.
- 4.2.5 Pointed ornamental parts shall not be mounted on the front and rear fenders.
- 4.2.6 No ornamental or other parts shall be mounted less than 6.25 feet above ground level if they are of such a nature that they increase the risk of bodily injury in the case of impact with other road users.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

97-GP-27

1 November 1966.

STANDARD

for

REAR LUGGAGE COMPARTMENT BARRIER
for AUTOMOTIVE VEHICLES

1. *Definition*

- 1.1 This standard establishes requirements to ensure the presence of a protective barrier between the trunk and the rear of the passenger compartment, to prevent the intrusion of articles of automotive hardware and luggage into the passenger compartment.

2. *Applicable Publications*

- 2.1 The following publication is applicable to this standard:
 - 2.1.1 *Society of Automotive Engineers (SAE)*
J850, Barrier Collision Test.
- 2.2 Reference to the above publication is to the latest issue, unless otherwise specified.

3. *Applicability*

- 3.1 This standard applies only to passenger cars.

4. *Detail Requirements*

- 4.1 A transverse diaphragm shall be constructed between the back seat and the trunk to prevent penetration into the rear seat area of items likely to be in the trunk, such as luggage, tools, etc., when the vehicle is subjected to barrier impact.
- 4.2 The barrier impact test shall be made at 30 miles per hour in accordance with SAE J850.

5. *Notes*

- 5.1 The publication listed in Section 2 is available from the CGSB Secretary.

Correspondence regarding this standard should be addressed to the Secretary, Canadian Government Specifications Board, c/o Department of Defence Production, Ottawa 4, Canada.

GUIDE TO TRAFFIC SAFETY

Part I—The Human Factor

Part II—The Vehicle

Part III—The Environment

(for index to Part II see this Appendix, end of Part II, subappendix (i))

GUIDE TO TRAFFIC SAFETY

PART I

THE HUMAN FACTOR

1. *Objective*

The objective of this section of the Guide to Traffic Safety is to give the best available information for the identification and control of human factors that impair driving ability.

2. *Introduction*

- 2.1 The human element is the most complex, the most variable and the most difficult to control of the interacting triad of human, mechanical and environmental factors involved in vehicular traffic. It is the consensus of informed authorities that human factors are responsible for by far the greater percentage of all traffic accidents. Unfortunately, little reliable data have been obtained to accurately define the magnitude of various human factors in accident causation.
- 2.2 There are few proven cut-off points or criteria to define fitness to drive, and few controlled studies have been carried out to indicate whether groups of drivers with any particular disease have higher accident rates than otherwise comparable groups.
- 2.3 Notwithstanding the deficiencies in our knowledge of the exact involvement of the human element in traffic accident causation, it cannot be overstressed that full responsibility for the control of the vehicle rests with the driver. He cannot reasonably expect that improvement in vehicle and highway design and construction will relieve him of this responsibility. When any of the factors affecting the driving task—the highway, weather conditions, the vehicle or his own physical or mental condition are less than optimum,—it must remain the responsibility of the driver to adapt his driving to these conditions.

3. *The Driving Task*

- 3.1 There are a series of separate, yet related problems within the framework of the driving task. Vision is a most prominent factor within this framework. In order to drive safely the driver must see what is ahead of him, beside him and behind him. He must understand what he sees, decide on what he will do depending on what he sees and understands, then carry out his decision. This same model refers to other senses such as hearing and touch although they are of lesser importance. The entire series of events may happen in a split second.
- 3.2 The driving task is complicated even more by the interrelationship of these component parts and the constantly changing set of conditions, both external and internal.

- 3.3 Certain deficiencies may exist in individual drivers in relation to these separate elements. They may stem from known medical impairments or from acquired impairments such as the ingestion of alcohol, or from under-developed capabilities resulting from lack of proper training. Many such factors may be anticipated and corrected by the driver.

4. *Accomplishment of the Driving Task*

- 4.1 To accomplish this task and carry out his responsibilities to himself, his passengers and others who may be in his sphere of responsibility, the driver requires an adequate measure of JUDGMENT and SKILL. These essential assets vary from driver to driver, and from time to time may vary in any one driver.
- 4.2 JUDGMENT is a combination of intelligence and experience. Normally it increases with exposure to varying traffic situations.
- 4.3 SKILL is gained from a combination of ability and training, and normally increases with additional driver education, formal or informal.
- 4.4 Although there is a minimum requirement for each of these talents, a reduction in one may be compensated for by an increase in the other. Within limits, advancing age is a good example: it may bring a deterioration in driving skill and reaction time that can be counterbalanced by improved judgment.

Ideally, judgment and skill are developed through an orderly progression:

- (a) an initial period of driver education
- (b) qualification by means of a driver test
- (c) driver improvement training to ensure continuing acceptable performance.

The ultimate demand on a driver's judgment and skill arises in an emergency. Fortunately, drivers are not frequently required to call upon their total resources, since critical situations are uncommon in normal vehicle operation. When these situations do arise, however, and demand more judgment and skill than the driver possesses, the result invariably is accident involvement.

5. *Medical Limitations*

- 5.1 Among the many causes contributing to automobile-inflicted injuries and deaths, medical limitations are recognized as a factor. If alcohol is included as a medical problem, it becomes the most significant factor in driver-produced casualties.
- 5.1.2 In many areas, controlled studies with large groups of drivers are not available. Further research is urgently needed. Pending clarification the following paragraphs set out provisional guides which are certain to be refined with the accumulation of further medical knowledge and statistical data.

5.2 Vision

Visual function is extremely complex and depends not only upon the capability and clarity of seeing but also upon the interpretation of what is seen. Capability and clarity are measurable quantities and reasonable minimal standards of those functions can be suggested. Interpretation is not easily measured but is commonly assumed to be reasonably adequate.

5.2.1 Visual Acuity

Visual acuity is measured in terms of ability to clearly distinguish form at various distances. Using standard Snellen eye charts, normal vision includes the ability to clearly distinguish increasingly larger letters from a specific minimal size up to a specific larger size at a distance of 20 feet.

5.2.2 20/20 vision means the individual can clearly distinguish the letters on the 20 line of the eye chart at a distance of 20 feet. (He may even be able to read some letters of smaller size.) Such an individual should be able to clearly distinguish letters on the 200 foot line of the chart at a distance of 200 feet.

5.2.3 The size of the letters and numerals on Ontario motor vehicle plates corresponds approximately to the size of the letters on the 100 foot line of the Snellen charts. Accordingly, if those letters and numerals can be clearly distinguished at a distance of 100 feet the observer likely has normal vision (20/20 or better). If an observer must be 40 feet or closer to clearly distinguish the letters and numerals his vision is likely to be 20/40 or less.

5.2.4 In private passenger vehicle operation, with or without glasses, visual acuity not less than 20/40 in the better eye is desirable.

5.2.5 With or without glasses, visual acuity not less than R. 20/30, L. 20/30 is recommended for commercial passenger vehicle drivers.

5.2.6 If vision with glasses is less than 20/20 in one eye, that eye is considered useless in the driving task.

5.2.7 Drivers with sight in only one eye, should have vision, with or without glasses, not less than 20/30 in the functional eye and should be required to demonstrate proficiency adequate to the driving task.

5.2.8 It is well known that visual acuity and night visual capacity decrease with advancing age. Cognizance of these facts should be taken, in assessing elderly drivers.

5.3 Visual Fields

It is recognized that a good field of vision is of particular importance in avoiding intersection collisions. Drivers, especially persons with corrected acuity at the lower limits of acceptability, should have visual fields not less than 110°. Individuals with markedly constricted fields should not drive.

5.3.1 Eye Muscle Balance

Any person with eye muscle imbalance or squint of sufficient severity to cause uncontrolled continuous or frequently recurrent double vision cannot drive safely.

5.3.2 *Color Blindness*

Defective color perception is not an important driving hazard since traffic lights are standardized in most areas and compensation is made by attention to position of lights.

5.4 *Hearing*

- 5.4.1 Deafness is acknowledged to constitute a relatively slight hazard in private vehicle operation since compensation can usually be made by use of outside rearview mirrors and increased alertness on the part of the driver.
- 5.4.2 The unit measure of sound intensity is the decibel. Employing an Audiometer, human hearing is assessed in terms of decibels perceived at frequencies from 250 to 8,000 cycles per second. Hearing is usually considered normal if perceptive loss is no greater than 20 decibels throughout the 250 - 8,000 c.p.s. frequency range. Roughly, with eyes closed to prevent lip reading and with each ear tested separately, an individual who cannot accurately and consistently perceive the whispered voice with each ear at a distance of 20 feet, is likely to have a bilateral hearing loss in excess of 20 decibels.
- 5.4.3 Persons with a hearing loss greater than 30 decibels in either ear for the frequencies 500 - 1000 - 2000 cannot drive a passenger bus or taxicab safely, because the increased difficulty in talking with passengers in a noisy environment is likely to prove a distracting influence. The use of hearing aids has not proved to be practical in the case of passenger-bus drivers.
- 5.4.4 Anyone who is subject to attacks of sudden dizziness without warning due to disease of the inner ear should not drive until such attacks are fully controlled by treatment. Persons with this type of disability should not drive commercially.

5.5 *Heart Diseases*

- 5.5.1 A recent study¹ has shown that persons suffering diseases of the heart and blood vessels average twice as many accidents per million miles of driving as drivers in the comparison group on an age-adjusted basis. Most types of heart disease do not constitute a limitation for the operation of private motor vehicles if they are adequately controlled by treatment, but they are limiting factors in commercial driving.
- 5.5.2 Coronary thrombosis is one of the most frequent distabilities suffered by persons more than fifty years old. Following adequate rehabilitation, a person may drive a private vehicle, but commercial driving is precluded. The symptom of Angina pectoris, a chest pain commonly associated with this type of illness, should preclude driving heavy commercial vehicles as the exertion involved may precipitate the pain and result in distraction from the task. Angina Pectoris need not preclude private passenger vehicle operation unless attacks are frequent and unresponsive to therapy. If pain is precipitated by slight emotional upset or by the effort of manœuvring a car in heavy traffic, it constitutes an absolute contra-indication to driving.

5.5.3 High blood pressure controlled by treatment need not limit driving. Complications such as damage to heart, brain or eyes must be individually evaluated.

5.5.4 Various other disorders such as congenital and rheumatic heart disease may cause heart failure and merit careful medical assessment. Generalized hardening of the arteries creates progressive increase in reaction time and may constitute driver limitation at any time according to the judgment of the examining physician. A number of persons with disturbances in heart-beat rhythm are now fitted with artificial pacemakers. Such patients must be evaluated on an individual basis and reassessed at least annually. As yet there is no body of evidence on which to base a sound decision as to the ability of such persons to drive safely. Until further experience has accumulated, it is considered that persons with pacemakers can drive a private motor vehicle if they are receiving medical attention. They should not drive passenger transports or commercial vehicles.

5.6 *Diabetes*

A patient with diabetes fully controlled by diet, with or without oral medication, can drive safely. If on insulin, he should be aware of the danger of low blood sugar reactions. Persons requiring insulin to control diabetes should not drive passenger transport or heavy commercial vehicles.

5.7 *Diseases of the respiratory system*

Few conditions of the nose, throat and lungs normally interfere with driving. Persons with disorders that interfere with speech or breathing should not operate a commercial vehicle. Any patients with a permanent tracheotomy, however, probably should not drive because of the possibility of sudden obstruction.

5.8 *Diseases of the nervous system*

5.8.1 *Mental Diseases*

When a patient is discharged from a mental hospital or if under psychiatric care, he should receive his physician's advice on his capability to drive. This advice should also be conveyed to a responsible relative. Any person receiving sedatives, tranquilizers or psycho-energizing drugs must be cautioned against or prohibited from driving, depending on the severity of the case and the dosage administered. The doctor's advice on possible effects of drugs should also be followed.

5.8.2 *Mental Deficiency*

No one with an intelligence quotient of less than 70 should ever operate a motor vehicle. Those with an I.Q. of 70 to 80 are more susceptible to accidents than normal individuals when faced with emergency situations requiring accurate judgment or decisive action.

5.8.3 *Epilepsy*

Persons suffering from epilepsy should not drive until they have been free from seizures for at least two years and provided they have no undesirable side effects from their medication. They

should not drive commercial vehicles. Alcoholic beverages should not be consumed for at least 24 hours before driving. Prolonged periods of driving should be avoided since fatigue may produce an attack. The emotional strain of driving in heavy traffic and the stimulation of opposing headlights when driving at night may precipitate a seizure.

5.8.4 *Narcolepsy*

This is a rare disorder characterized by recurrent episodes of irresistible drowsiness or sleep which preclude maintenance of a healthy degree of alertness. The episodes vary from periods of a few moments of decreased alertness to prolonged periods of sleep. Narcoleptics may suddenly drop off to sleep during the course of conversation, while eating a meal, or while driving, etc. Although narcolepsy may be severe, moderate or mild, it presents a great potential hazard in any form if the person must drive. Those affected should not drive, or should restrict their driving when they are not alert. With plenty of sleep and proper use of drugs under a physician's guidance, such persons can achieve a normal degree of alertness and become safe drivers.

5.8.5 *Disorders Affecting Muscular Control or Co-ordination*

A wide variety of illnesses affect the nervous system, each posing a special problem with respect to driving ability. Included in this group are such conditions as polio, muscular dystrophy and multiple sclerosis. The more serious disorders generally cause either rapid deterioration or sufficient functional disability that individuals will cease to drive by their own volition. In slowly progressive cases, it is the physician's responsibility to recommend to the patient that he discontinue driving when the disability becomes recognizable as a hazard to the driving task.

5.9 *Disease of the Muscles and Skeleton*

- 5.9.1 Defects that impair driving ability should be evaluated by the person in charge of driving tests for the licensing authorities. If special devices are necessary, drivers should demonstrate their capability to use them.
- 5.9.2 Physicians can advise on driving when patients suffer temporary disabilities, particularly persons wearing casts or braces. No attempt should be made to drive unless full control of the vehicle is certain.

5.10 *Alcohol*

- 5.10.1 Safe driving and ingestion of alcohol are incompatible. There is now ample evidence that approximately one-half of crashes fatal to vehicle occupants, and one-fifth of crashes in which vehicle occupants suffer non fatal injury, result at least in part from the effect of alcohol. A classic study⁽⁹⁾ has established that blood alcohol levels over 40 mg. per cent or 0.04 per cent by weight, are definitely associated with an increased accident involvement. The probability of accident involvement increases rapidly at alcohol levels over 0.08 per cent and becomes extremely high at levels above 0.15 per cent.

When drivers with blood alcohol levels exceeding 0.08 per cent have accidents, they tend to have more single vehicle accidents and more severe accidents in terms of injury and damage, than comparable similar sober drivers.

- 5.10.2 For most persons, impairment begins at a blood alcohol level as low as 0.03 per cent, which is usually reached after one or two drinks. At this point people develop a false sense of well-being. They are the last to realize that the most highly developed functions of their brain such as intellect, perception and judgment are becoming impaired. This occurs long before the more basic functions, such as co-ordination of muscular activity are lost. Numerous studies using individuals accustomed to drinking are in agreement that two 12-ounce bottles of beer or two ounces of whisky consumed within one hour will put the average moderate drinker in the zone of 0.035 per cent blood alcohol. Three 12-ounce bottles of beer or three ounces of whisky within the same period will result in more than 0.05 per cent blood alcohol.
- 5.10.3 The average person of 150 pounds can only use up and/or eliminate enough alcohol in an hour to reduce his blood alcohol level by 0.015 per cent. This offers a clue to the length of the necessary waiting period after drinking before driving.
- 5.10.4 There is also evidence that incipient alcoholics or those with histories of problem drinking form the core of the offending groups who drink and drive with subsequent accident involvement, and that such persons frequently suffer an underlying psychiatric illness.

5.11 *Carbon Monoxide*

The adverse effect of carbon monoxide, from exhausts and from smoking, on driving ability is in decreasing the visual sensitivity of the eye in areas of low illumination. The relative oxygen deficiency from smoking three cigarettes is equal to that of traveling at a 7,500 foot altitude. Since adequate ventilation does not take care of chain smokers who inhale, drivers should refrain from frequent smoking prior to and during periods of driving or at high altitudes particularly at night. The danger of high carbon monoxide levels in inadequately ventilated vehicles should be emphasized and great caution advised.

5.12 *Drugs*

Many prescription and over-the-counter drugs can affect judgment and behaviour either favourably or unfavourably. There is, however, little scientific evidence concerning the extent to which individual classes of drugs contribute either to the prevention or causation of highway accidents. Research in this area is urgently required. Limited studies have shown that less than half of one per cent of drivers found to be impaired were under the influence of drugs other than alcohol. The great quantity of sedative and stimulant tablets marketed through illicit channels constitutes a potential hazard. Physicians administering drugs likely to impair sensory, mental or physical functions have a clear responsibility to inform their patients about the unusual effect of drugs on some people and the potential effect on driving. Patients have a clear

responsibility to ask about the effects of drugs and to curtail their driving until the effect of a drug is fully appreciated. The highly dangerous additive effects of combining most commonly prescribed drugs and alcohol cannot be overemphasized and should be widely publicized.

5.12.1 *Tranquilizers*

Persons in the initial stages of dosage adjustment, especially those on large doses, may suffer drowsiness or faintness and should not drive. Patients who are stabilized and symptom-free may operate a private vehicle safely

5.12.2 *Stimulants*

The benefit of the mild stimulant effect of caffeine contained in tea and coffee is well known and enjoyed by millions. Although the more potent central nervous system stimulants such as amphetamine temporarily increase alertness and efficiency, large doses may produce headache, dizziness, agitation, irritability, hallucinations and decreased ability to concentrate. Fatigue and depression follow the initial stimulation, and these drugs should only be used on the advice of a physician.

5.12.3 *Pain-Relieving Drugs*

Narcotic drugs, such as morphine, impair driving ability by causing a false sense of well-being, inability to concentrate, apathy, dimness of vision and rapid flow of uncontrolled thought. Driving should not be undertaken while under the influence of such drugs.

5.12.4 *Antihistamines and Drugs Preventing Motion Sickness*

There is a great deal of individual difference in reaction to such drugs with dizziness or drowsiness occurring fairly frequently. Patients using such drugs should not drive until it has been established by prior trial that they do not experience dizziness or drowsiness.

6. *Psychological Aspects*

Determining psychological fitness to drive is extremely difficult since the boundary between normal behavior and abnormal behavior is hard to define even in controlled psychological experiments.

6.1 *Attitudes and Driver Education*

6.1.1 The extent to which personality deficiencies contribute to an individual's accident record is ill-defined, and this is unavoidable in view of the complexity of the factors that operate in establishing a state of mind. It has, however, been demonstrated that maladjustments in meeting the personal and social demands of living are far more frequent among accident repeaters than among accident-free groups.

6.1.2 It is well known that younger drivers are over-represented in traffic accident statistics and in consequence, the goals of traffic safety education hold great significance in Canada today. Each segment of the community has a responsibility in meeting this challenge. The initial obligation rests upon the parents, since the example they set is a powerful influence on the personality of the child. Responsibility

also rests on the school, community agency and individual. The problem resolves itself into how to help young people develop stable life-long patterns of intelligent thought, action and attitudes.

6.1.3 The essence of a good driver-training course should be two-fold:— development of *skill* in handling the vehicle and development of *judgment* in making driving decisions. With most young people the first task is by far the easier. Their reactions are fast and their physical responses are good. The development of judgment, however, is more difficult and not easily measured. Because this is so, normally it receives insufficient emphasis. An integral part of this aspect of driver-training is the attitude or the "driving conscience" of the student. In some, this too will require development. The subject is competently covered in the "Teacher's Handbook for Sportsmanlike Driving"⁽³⁾ (published under the auspices of the Canadian Automobile Association.)

6.1.4 Studies of groups of young drivers⁽⁴⁾ have demonstrated that the accident involvement of trained drivers is substantially lower than that of untrained. In consequence a good driver-education program for all young Canadians about to apply for a driver licence would be a major advance in the traffic safety program.

6.2 Accident Repeaters

Removal of the "accident repeater" from the road is a concept that has received some statistical attention in recent years. It has not, however, proved useful as a basis by which susceptible individuals may be recognized in advance of their accidents. One study⁽⁵⁾ examined the driving records of vehicle operators over two successive three-year periods. It showed that if all drivers with two or more accidents (i.e. the minimum number to permit the classification of "repeater", during the first period had been prohibited from driving during the second period, the number of accidents during the latter period would have been reduced by less than 4 per cent. Hence it appears that while accident repeaters exist, overly restrictive licensing would be required to have any appreciable effect on traffic accident frequency.

6.3 Emotional Disturbances

Many situations create temporary emotional upset in normal people. The individual may become absorbed in his problem and despondent or even antagonistic or aggressive. In all such moods persons are susceptible to accidents and should not drive while so affected.

6.4 Fatigue

Fatigued, drowsy and sleepy drivers are responsible for many accidents. They are unable to make split-second decisions, reaction time is slowed and there is a loss of peripheral vision and attention. In addition, many individuals are victims of "Highway hypnosis" or hallucinations. There are three distinct aspects of fatigue: mental, physical and skill. These three aspects are, to a degree, interdependent and not clearly separable. *Mental fatigue* is often evidenced by a decrease in concentration, dullness and heightened irritability. Boredom may be considered a

part of mental fatigue but the converse does not appear to be true. *Physical fatigue* is promoted by any form of continuous discomfort—seating position, excessive noise level, or vibration. On a long drive, fatigue levels may be lowered by changing the seating position regularly and by stopping every two or three hours. A short walk, a small amount of food, tea or coffee during each stop may also help. *Skill fatigue* is extremely difficult for the subject to recognize in himself. It is evidenced in a number of forms such as permitting greater deviations before corrective action is taken, followed by over-correction. Most insidious of all is the belief on the part of the individual that his skill performance has not deteriorated.

Simplification of the driving task will delay the onset of all three aspects of fatigue and would make a significant contribution to traffic safety.

6.5 Driver Distraction

The complexities of the highway environment in today's driving of a motor vehicle places considerable demands on the drivers' perceptual and visual capabilities which necessitates the elimination of distraction, wherever possible. To assist the driver, efforts are being made to reduce the reflectance from windshield wipers, interior objects and construction to eliminate distractive reflection in these areas. Improvement in the uniformity of road signing, marking and use of reflective materials is continually being explored and evaluated so that the driver will be able to perceive a clear message of intent immediately. The driver can also be distracted by circumstances and events taking place within the vehicle. Insects for example can create a hostile atmosphere such as the invasion of the vehicle interior by a wasp which can create serious distraction and should be eliminated by selecting as quickly as possible a safe location to stop the vehicle. The attention of the driver can be distracted and aggravated by unnecessary passenger activity, particularly on the part of young children, high interior noise levels, etc. Normally these circumstances are controllable and can be eliminated.

7. Motorcycles

7.1 In both Canada and the United States motorcycling has become increasingly popular during the past decade. Motorcycle sales, motorcycle traffic, motorcycle accidents and motorcycle fatalities have all increased appreciably.

7.2 Statistics

Available statistics indicate that age groups 15 to 29 are most frequently involved. Collisions with other vehicles account for approximately 62 per cent of accidents while non-collision traffic accidents add another 32 per cent. In Canada 1807 motorcyclists or passengers were injured while 34 were killed during 1964: the majority occurring in the period April through September (six months).

7.3 Casual factors

Accumulated evidence strongly suggests that motorcycle riders are killed and injured because:

- (1) many riders lack adequate training and experience in controlling their vehicle;
- (2) riders are inadequately informed of the inherent dangers of motorcycling and are unprepared to cope with hazardous traffic situations; pedestrians and other vehicle operators are not prepared properly to recognize, accept and assist in the resolution of traffic problems created by the presence of motorcyclists in the milieu.

7.4 Personal protection

Human factors are undoubtedly of major importance in motorcycle accidents and all that has been said about the driver of other vehicles is applicable to the motorcyclist. In addition specific attention should be directed towards peculiarities of motorcycling which dictate necessity for specialized personal accoutrements such as crash helmets, goggles, face shields and protective clothing including footwear.

7.5 Crash Helmets

Most of the fatal accidents and many of the non-fatal accidents involve injury to the head and neck. Most of morbidity and mortality could be avoided by the simple expedient of wearing an approved motorcycle crash helmet. Research⁸ has shown that the use of helmets reduced the risk of head injury by 33 per cent and death by 40 per cent.

Bicyclists

During the year 1965, 88 Canadians lost their lives while riding a bicycle. Numerically, this does not make the bicyclist a major factor in the annual traffic accident toll. However two aspects of this situation magnify its importance:

- (1) The majority of the victims were young people and the consequent loss of life expectancy was relatively high.
- (2) The bicycle is a vehicle which should be operated according to normal traffic laws. Hence, invariably it is the bicyclist's first experience in operating a legal vehicle in traffic. This fact underlines the necessity for adequate training in the rules of the road and the development of a good driving attitude.

On their part, many vehicle operators fail to consider a bicycle as another vehicle. This too is an underlying cause of bicycle accidents.

Pedestrians

- 9.1 Currently in Canada, one pedestrian is killed for every three fatalities in motor vehicles; one pedestrian is injured for every six persons injured in motor vehicles. As might be expected the pedestrian toll is much higher in urban areas. For example, in Metropolitan Toronto in 1965, 63 pedestrians were killed as compared to 57 motor vehicle occupants.

- 9.1.1 The most cursory examination of this situation immediately reveal certain similarities and dis-similarities in the victims of motor vehicle and pedestrian accidents. The following table sets out the data as they relate to age:

TRAFFIC FATALITIES IN CANADA—1964*

Age Group	Pedestrians	M.V. Occupants
0-14	250 (36%)	93 (8%)
15-64	248 (36%)	952 (79%)
65-Over	189 (28%)	157 (13%)

*Province of Quebec breakdown not available.

When these figures are considered in relation to the populations at risk in the various age groups it is obvious that the very young and the elderly are much more susceptible to pedestrian accidents.

- 9.1.2 Existing studies in this field indicate that in the lower age groups unsettled family environment and inadequate safety training both in the home and school are major contributing factors.⁶ In the older age group, alcohol has been shown to be a significant factor.⁷ Carelessness or inattention on the part of the driver is evident in many cases where he is blameworthy.

9.2 Factors

There are many factors which complicate any program to decrease the number of pedestrian accidents. Basically there is the problem of age—as soon as an individual can walk and as long as he can walk, he can become involved in a pedestrian traffic accident. Further, the measure of control now exercised by means of driver licensing, is not available in the case of pedestrians.

- 9.2.1 Nevertheless, the gravity of this problem calls for energetic action in an effort to lessen the toll of death and injury to pedestrians. Improvement in this area insofar as pedestrian responsibility is concerned can best be effected by:

- (1) Education of the young in the home and in schools.
- (2) Continuing education of the public by safety and community organizations.
- (3) Thoughtful legislation and control of pedestrians, particularly in urban areas.
- (4) Design of roadways and walks to separate the pedestrian from the vehicle environment as much as possible.

10. Indications for Medical Examinations

A medical examination is indicated under the following circumstances:

- (a) Following accidents in which the driver or investigator believes contributing medical factors such as loss of consciousness, failure to see collision objects, etc., were involved.
- (b) The presence of gross physical impairments at the time of application for, or renewal of a driver's licence.

(c) As recommended by staff physician reports at the time of discharge from mental institutions.

(d) On the basis of previous examinations that have revealed medical limitations.

(e) Following multiple accidents or multiple offenses.

(f) School health reports reviewed at the time of enrollment in driver-training classes.

Age itself is not necessarily a driver limitation. Medical evidence clearly indicates certain progressive impairments that accompany the aging process, ultimately leading to pathological deviations from the normal. Therefore, driver fitness should be based on functional capacities rather than age per se.

11. Human Engineering

The term "Human Engineering" is relatively new, having come into general use during the second world war. It was applied to the cockpit design of aircraft and based on the concept that the machine is a functional extension of the human operator.

A number of advantages can be expected by application of this concept:

- less physical and mental effort is required
- less training is required
- operation will not present ambiguities or conflict with established habits.
- automatic reaction to an emergency is more likely to be the correct one

Thus, the primary objective of this concept is to design "man-machine systems" which in normal use will operate with maximum effectiveness and minimum error.

There are many examples of the advantages of applying the principles of human engineering to automobile design. The horn switch is a simple one. Frequently the horn is blown as a warning when an emergency situation appears to be developing and time is critical. With most drivers this becomes an automatic reaction and if the location of the switch is inconvenient or unfamiliar, delay and distraction of the driver is the result.

The gear selection pattern of an automatic transmission is a case where good human engineering is now being demonstrated.

Standardization of design is an important factor in human engineering. Here, however, we must be prepared to accept some degree of compromise since, over a period of time, complete standardization would rule out improvement. In consequence, the value of a technical advance should be weighted against its non standard operation (if such is required) before an alteration is made to an existing arrangement.

In general, than, it may be said that application of the known principles of human engineering make accident-free accomplishment of the driving task easier for the vehicle operator. When the complexity of that task is examined, this becomes a worthwhile objective.

GUIDE TO TRAFFIC SAFETY

PART II—THE VEHICLE

TABLE OF CONTENTS

Section

- 1 Introduction
 - 2 Design for Prevention of Accidents
 - 3 Inspection and Maintenance
 - 4 Design for Prevention of Injury
- Subappendix (i)—Index to Part II and Standards.

AUTOMOTIVE VEHICLE SAFETY CODE

PART II—THE VEHICLE

1. Introduction

- 1.1 PURPOSE—The purpose of this part of the Guide is to discuss in nontechnical terms those features of vehicles that affect their safe operation. It should be understood when examining this part of the Guide that research into the cause of accidents is continuing on a wide range of subjects and there are still many unknowns in the total picture of vehicle accidents. The general comments and remarks in the following sections give some indication of the problem areas and possible corrective action, although subsequent research may develop alternative solutions not covered in this section.

This part makes reference to standards for a number of safety features that are now, or will shortly be available as regular components or optional accessories. These standards are similar to those developed by the General Services Administration in the United States and were prepared in consultation with automotive engineers, medical associations, safety organizations and government agencies.

1.2 DEFINITIONS

- 1.2.1 *Automotive Vehicle*—In general, any vehicle that is self-propelled or driven by mechanical power and designed for use on highways. Military tactical, combat and training vehicles, motorcycles, special purpose delivery vehicles, trailers and trucks over 10,000 lb. pound gross vehicle weight, however, not generally included in the standards at this time.
- 1.2.2 *Safe Vehicle*—A "safe vehicle" in the true sense is an abstraction; however, a relatively safe vehicle is one that because of its design is unlikely to be involved in an accident when properly driven, but in the event of an accident it will protect its occupants, minimize injury to pedestrians and other road users, and retain all these characteristics throughout its life with adequate maintenance.

2. Design for Prevention of Accidents

Since the most desirable way to prevent injuries is to prevent accidents, vehicle features that reduce the likelihood of accidents are of prime importance.

- 2.1 STABILITY AND HANDLING—To assist in avoiding accidents the driver should be able to steer his vehicle quickly and accurately under all road conditions, speeds and rated loads. The steering characteristics should remain relatively constant throughout changes in speed and loading; in particular, there should be no sudden change from under-steering to over-steering or vice versa, at any speed or rate of turn. Additionally the vehicle should not exhibit

radically different steering characteristics when a sudden change in road surface is encountered. Vehicle response to either control or disturbance should be within the capabilities of a driver having less than average strength. The driver's primary function is to command and guide, and be responsible for the stabilization of the vehicle even with unusual loading such as may be carried on the roof.

2.1.1 *Steering Effort and Response*—In order that a driver may be able to steer his vehicle quickly, the amount of steering-wheel motion required to produce a given degree of turn of the road wheels must be compromised with the turning effort required. For vehicles having heavy loads on the steering road wheels, these incompatible requirements may require power-assisted steering. For weaker drivers of heavier vehicles, power-steering may be essential for safety and avoidance of undue fatigue. The use of variable gear ratio power-steering systems that provide maximum of power assist at low speeds, as for parking, and a minimum assist or maximum "road feel" at highway speeds, would be advantageous to the user. Power-assisted steering systems should be designed so that in the event of power failure the steering effort required to control the vehicle is not beyond the short-term capabilities of weaker drivers.

2.1.2 *Suspension and Road Feel*—The vehicle suspension should resist over-turning moments even in severe steering manoeuvres. The steering mechanism and suspension should provide some "feed back" so that the driver can feel as well as see turning actions.

2.2 CONTROLS AND BEZELS—For a vehicle to be safe it must obviously be controllable. The essential features of all control devices are efficiency, reliability, accessibility and identifiability. All controls—accelerator, brakes, lights, wipers, washers, gear shift, door, window, heaters, etc.—must be considered. Controls and bezels must be located and mounted to minimize injury to occupants (Standard 97-GP-3.)

2.2.1 *Pedal Spacing*—The spacing between the accelerator and brake pedals is important. If these are too close, either horizontally or vertically, there is a possibility of one being applied when the other is intended, or the foot slipping off the brake onto the accelerator, or of both being depressed simultaneously. On the other hand, if the brake and accelerator are too far apart, the time required to move the foot from one to the other in an emergency will be increased, and an accident that might have been avoided may result. The wide variation in pedal spacing in vehicles suggests the desirability of human engineering studies to establish optimum spacings.

2.2.2 *Parking-Brake Controls*—The parking brake should be easy to apply and release, at the same time it should be equipped with a "BRAKE ON" warning device and be secure against accidental release. It should be located so as to afford minimum hazard to occupants in an accident, and as far as practicable in a standard location with a standard method of release and application. It should be effective for restraining the vehicle against both forward and backward move-

ments. The parking brake is *NOT NORMALLY DESIGNED AS AN EMERGENCY BRAKE FOR EMERGENCY STOPPING*, but if it is claimed by the car manufacturer to be an *EMERGENCY BRAKE*, it shall be capable of bringing the vehicle to a safe stop from highway speeds. The driver's manual should provide instructions on the proper method of using the emergency brake for this purpose, and the brake mechanism should make it possible to "feather" the brakes to avoid wheel lock-up.

2.2.3 *Switches, Keys, Knobs, etc.*—Controls for lights, wipers, washers, heaters, radios, etc., should be so located that the driver need not divert his attention from the road to use them. They should also be located to present minimum hazard to occupants in an accident (97-GP-3). They should be so separated that there is a minimum possibility of confusing them, as, for example, turning off the headlights instead of the wiper. Since drivers frequently change cars, it would be desirable that there be as much standardization as feasible in the location of these controls. The possibility of coding controls by shape, symbol and mode of operation should be explored. The horn control should be so designated that it can be easily and readily actuated.

2.2.4 *Adjustability*—The driver's seat, steering wheel and foot-operated controls should be mutually adjustable so that a short driver can have an adequate field of view and reach all controls readily. Manufacturers might consider providing, as optional extras, seat blocks and pedal extensions for the small proportion of the population for which the range of adjustment in cars is inadequate.

2.2.5 *Standard Gear Quadrant or Shift*—Since accidents may be caused by drivers operating cars with which they are not fully familiar, it is desirable that controls for both automatic and manual transmissions be standardized (97-GP-11). It is important that the positions controlling reverse and forward motion be well separated. Installation of the transmission selector lever to the left-hand side of the steering column, away from the impact area, should be studied since its present position presents a hazard to a front seat passenger who may be propelled to the left in the event of a collision.

2.3 **BRAKES**—The design of the brake system should produce a balanced retarding force proportional to the force exerted by the driver. The force required by the driver to produce maximum retardation should be within the capabilities of all drivers and this may require some form of power or vacuum assistance. The maximum retarding force exerted by the brake system on each wheel must allow for a reasonable safety factor and degradation of performance with time. A heavy-duty brake system should be fitted when the use of a trailer without separate braking system is contemplated. When power-assisted brakes are fitted, their design should be such that in the event of power failure the effort required to bring the vehicle to a safe stop from highway speeds should not be beyond the short-term capabilities of weaker drivers. The brake system should be designed so that any change in effectiveness due to heat build-up, fade, moisture ingress, self-adjustment, etc., will not be sudden.

- 2.3.1 *Split Brakes*—With hydraulic brake systems there is a possibility of a sudden and complete loss of braking ability due to a rupture anywhere in the fluid system. It is therefore desirable that the brake system be divided into two systems so that if one is damaged, the other will continue to function and provide some braking capability (97-GP-9).
- 2.3.2 *Non-locking Brakes*—Since directional control of the vehicle is completely lost when front-wheel brakes lock, and is seriously disturbed by locking in the rear brakes, it is essential that wheel lock be controllable by the driver unless proven reliable devices that sense and prevent impending wheel lock are fitted. Such a system of braking would have particular advantages in the controlled stopping of a vehicle on ice or other slippery surfaces. These systems are now under research and development.
- 2.3.3 *Disc Brakes*—Disc brakes are claimed to provide better performance for high-speed driving, driving on mountain roads, etc., because of their increased ability to dissipate heat. They are also less likely to be adversely affected by water. Drum brakes are quite satisfactory for normal driving. The combination of front-wheel disc brakes and rear-wheel drum brakes may have some advantages.
- 2.3.4 *Front and Rear Distribution*—Due to the weight distribution of the average car and the shift of weight that occurs on braking, the front-wheel brakes are required to do more than half of the stopping. Unless the brake system is provided with valving, or other such inherent design characteristics, it will be easy to lock the back brakes while the front wheels are still turning. To achieve the most rapid controlled stops, the brake system should be so designed as to counteract this tendency by considering a method of metering and/or brake proportioning to keep braking forces proportional to the load carried on each axle whether the vehicle is laden or unladen.
- 2.3.5 *Self-Adjustment*—Brake systems should have a built-in self-adjustment feature, or slack adjustment system, so that brakes constantly act with optimum efficiency. A means of warning the driver when the brake linings have worn to the danger point is required.

2.4 POWER PLANT

- 2.4.1 *Power-Weight Ratio*—A sufficiently high power-weight ratio is essential to permit a driver to extricate himself safely from some driving hazards. Any ratio very much under the average can be dangerous. It may also be hazardous to have an excessive power-weight ratio since this is frequently an incentive to drive too fast for the driver's skill and the highway conditions, and can lead to skidding when starting on slippery pavements.
- 2.4.2 *Sticking Accelerators, Brake Controls, Clutch Controls Etc.*—The accelerator and its linkages, and all other speed-control devices, should not be affected by weather, temperature or invasion by road dirt, mud, slush, etc. The accelerator system should be such that in the event of the failure of any part of the linkage, the engine is

automatically throttled back to at least a point where the vehicle can be brought to a stop safely by use of the brakes. The brake and clutch linkages and controls should not be affected by weather or invasion by road dirt, mud, slush, etc.

- 2.4.3 *Stalling*—The engine, the carburetor and the electrical system should be resistant to moisture, icing and other conditions that might cause sudden stalling.

2.5 VISION—Vision is the one common denominator of all three elements of safe driving; the vehicle, the environment, the operator. Though vision factors are infrequently the detectable cause of accidents, they undeniably play an important role in driving. Vision informs the driver about the road conditions, signs and markings, and about what the driver ahead or behind is doing or intends to do. Poor vision may cause a driver to hesitate unnecessarily or to make dangerous manoeuvres. Visual failures occur when demands on the driver are beyond the limitations of normal vision. This may be caused by poor eyesight, dirty glass, glare, defective headlights or by parts of the automobile (such as reflected surfaces, corner posts, etc.) interfering with the vision. Vision has not received the necessary attention in the field of highway and automotive engineering safety. The vehicles and highways of the future must be designed within the visual and perceptual capabilities of drivers.

- 2.5.1 *Glare*—The vision of a driver can be suddenly impaired by glare as, for instance, by improperly adjusted headlights of an oncoming car, or in daytime when driving from a dimly illuminated tunnel or garage into a sunlit street. Glare may also originate with highly reflective objects such as the hood, windshield and wiper arms in the driver's field of view. Glare reduces the driver's ability to distinguish details. Resistance to glare (that is, the ability to retain some vision regardless of the presence of glare) varies from person to person. It is reduced by age, carbon-monoxide from leaky exhausts, smoking, alcohol, fatigue and high altitude. During the day glare can be reduced by sun glasses and visors. At night the effects of glare may be reduced by the driver looking to one side to increase the glare angle. 97-GP-13 refers to glare-producing surfaces of the vehicle.

- 2.5.2 *Washers*—Dust, mud, salt and insects on the windshield decrease vision and increase light glare. It is therefore essential to keep windshields clean at all times. Windshield washers (97-GP-12) aid greatly in keeping the wiped portion of the outer surface clean and should be used whenever there is any appreciable accumulation of dirt on the surface. Inside surfaces also become dirty, particularly where defrosters are used frequently or where the occupants smoke. This dirt is less obvious but it may significantly reduce visibility and increase headlight glare. The inside surfaces of all windows should be cleaned frequently.

- 2.5.3 *Wipers*—For driving in rain, fog and snow, efficient wipers are obviously essential. Wipers should cover as much as possible of the windshield, including the center portion and the part between the driver's eye and the outside rear-view mirrors, if these are mounted on the fenders. Variable-speed wipers are desirable since there

should be adequate wiper capacity to handle downpours; but the wipers should be capable of going sufficiently slowly that they do not abrade the windshield unnecessarily in mist or light rain. Wiper blades should be cleaned or changed frequently to reduce the possibility of scratching the windshield. In the parked position the wiper blades should be flush with the bottom of the windshield and out of the driver's field of view. The fitting of wipers on rear windows would contribute to safety, particularly when the rear window is sharply angled and may accumulate snow. If the rear window is kept reasonably free from frost, fog and snow, and an outside mirror is properly fitted and used, there will normally be adequate visibility to the rear in most circumstances.

- 2.5.4 *Defrosters*—A proper combination of ventilation, heater and defroster is required for comfort and to keep windshield free from condensation in cold weather. Most cars now have defrosters that keep a reasonable area of the windshield free from frost and fog under normal circumstances. Few, however, succeed in keeping the rear window and the side windows of the front compartment free from fog and frost under any but rather mild conditions. Rear window defrosters, and vents that blow warm air on the side windows, would contribute to safety. The fitting of frost shields is a less desirable expedient. (97-GP-17)
- 2.5.5 *Headlights*—Headlights that conform to legal requirements provide reasonably adequate visibility without causing undue discomfort and glare to oncoming drivers, but few headlight systems are operated at maximum efficiency. It has been stated that the collection of dust from one day's normal driving can reduce the efficiency of a well-engineered headlight system by 50 per cent (Connolly, SAE paper, SP279, page 63). The desirability of cleaning headlight lenses frequently is obvious. Unfortunately, even more obvious defects such as burnt-out and poorly aimed lights are all too frequent. Except for cars equipped with "load levellers," headlight aim changes with loading. The development of headlights that could readily be adjusted for load would be desirable. Drivers planning extensive night driving with heavily laden cars should have their headlights aimed with the laden vehicle. Lights should be inspected, adjusted and cleaned frequently. The desirability of fitting yellow or amber lenses on headlights has not been proven. Such lenses reduce light reflected back into the driver's eyes from fog but they also reduce the intensity of light reaching the road.
- 2.5.6 *Mirrors*—Mirrors provide the simplest way of gaining information on traffic behind the driver. Until such time as periscopes are fitted, or radar or television devices are adapted to cars to amplify the driver's vision and acuity, the driver must depend on one or more rear-view mirrors for rearward vision. The inside rear-view mirror should be readily adjustable for all seat positions and driver sizes in cars and light trucks to allow vision through practically all of the back window, which should be as large as possible. For driving in

multi-lane roads, vision at the back corners of the vehicle is desirable. This is most easily achieved by fitting one or more outside rearview mirrors, and at least two in the case of trucks, vans and cars with trailers. The mirror on the left side being obviously more important than the one on the right side. The outside mirrors should be fitted so that the driver does not have to shift his head or eyes appreciably to use them. They should also be located in a position from which they can be readily adjusted from the inside of the vehicle, or they should be fitted with an inside adjustment mechanism. All mirrors should be free from vibration and distortion (97-GP-16). Convex mirrors provide a wider field of view than plane mirrors but change the relative size of reflected objectives so that it is difficult to judge distance.

2.5.7 *Corner Visibility*—It is desirable that the driver be able to see all four corners of his vehicle to facilitate parking and passing through narrow openings. The contribution of this feature to safety may be minimal but it is probable that many cars that are driven with broken headlights, signal lights, or tail lights may have had these broken in parking maneuvers. Reference points on the front corners of the car may also be of assistance in highway driving and passing. These reference points may, however, also serve as pedestrian hazards, unless properly designed.

2.5.8 *Distractions*—No driver nor owner of a vehicle should allow visual obstructions in the form of signs, nontransparent materials, objects, etc., to be placed on windshields or windows, nor should objects be hung or attached to the interior of the vehicle to obstruct the operators clear view of the roadway or distract his attention. The inspection stickers, parking permits, etc., should be placed completely out of the vision area.

2.6 *Communication*—Effective communication between vehicles reduces the likelihood of accidents. The chief elements of communication are the size, shape and color of the vehicle, its lights, reflectors and horn. The communication devices should be clear, precise and free from any possibility of confusion. The vehicle should be so fitted that the operator can communicate his intentions to others with no ambiguity.

2.6.1 *Tail and Stop Lights*—The law requires tail, stop and licenseplate lights but allows wide latitude in their position, size, shape and brightness. A much higher degree of standardization than now exists is desirable, particularly in the relative brightness and positions of the stop and turn-signal lights. Since spacing of lights is used by drivers to estimate their distance from the vehicle ahead, the running lights on all vehicles should preferably be mounted a relatively constant distance apart. With a system using only red lights, the brightness difference between the running or tail lights and the stop lights should be great. The tail lights should be near the vehicle corners, and the turn-signal lights should not be capable of being confused with the stop light.

2.6.2 *Turn Signals*—The electric turn signal is an important communicative device that informs or warns other road users of a driver's

intention to change the direction of travel of his vehicle. Therefore, such signal systems should always provide the greatest opportunity for being seen by those drivers in the vicinity of the signaling car. Signal lights on front and rear should be spaced as far apart laterally as practical, so that the direction of a manoeuvre can be clearly understood and communicated. Visibility of front and rear signals should not be obstructed by any part of the vehicle throughout an acceptable visible angle and such signals should be mounted to give a wide-angle beam to facilitate lane change on multi-lane roads. The effectiveness of such signals can be enhanced by a standardized pattern of design, shape, location, intensity, color and size. Because of today's traffic speeds, density and required manoeuvrability, the addition of a supplementary light mount on each side of the vehicle to flash simultaneously with the turn signal lamps is highly desirable. Intervehicle communication grows more important each year and the function of the signal system becomes of increasing importance.

- 2.6.3 *Reflectorization*—The use of reflectorized shapes, conforming to national and international standards, to indicate road hazards either moving or stationary is a reliable means of communication. It is necessary to properly identify slow-moving vehicles, vehicles presenting a hazard to traffic, and vehicle licence plates, especially during the hours of dusk and darkness. The slow-moving vehicle presents both a day and night hazard to the normal traffic flow on highways. The proper mounting of a recognized slow-moving-vehicle emblem in the form of a triangle incorporating both day and night recognition is essential. The use of the internationally recognized red warning triangle to indicate vehicle breakdowns or other hazards is highly desirable. Such triangles should be part of the emergency equipment carried in each motor vehicle. The use of reflectorized licence plates provides an economical form of hazard recognition and should be encouraged. Such devices are particularly valuable in the event of an electrical failure at night. The addition of reflective strips to inner edges of doors, inside truck lids, etc., is an excellent method of providing hazard recognition and warning.
- 2.6.4 *Side-Marker Warning Devices*—Accidents have occurred, particularly at night and in fog, by the failure of the driver of an approaching automobile to recognize, in time to avoid collision, the outline of a parked or stationary automobile in the lateral position. Such conditions are exceptionally hazardous at dark intersections and on rural roads. Many automobiles are so designed that front and rear lighting is completely hidden from all lateral view. This situation can be alleviated by the use of reflective material to mark front and rear areas of automobiles, and by redesigning and relocating the electrical front and rear lighting so as to permit visibility from the sides (97-GP-23).
- 2.6.5 *Interior Vehicle Lighting*—The illumination of the instrument panel with a variable control that can be used at the discretion of the driver is the most satisfactory method. Surrounding light levels in

city driving may make is necessary to increase panel illumination, and conversely to lower panel illumination during country and highway driving to eliminate the distraction to forward vision. Illumination of ashtrays may be desirable for night driving providing the operator's forward vision is not impaired. Map lights, interior lights, vanity lights, etc. should not be used during night driving, when the vehicle is moving.

2.6.6 *Four-Way Flashers*—Serious and fatal injuries have resulted from the lack of adequate visual warning devices to designate stationary vehicles, particularly at night. To make it possible for a driver to warn other road users that his vehicle has become a hazard, the vehicle directional system should be so constructed that all signal lamps can be made to function simultaneously to warn drivers of the presence of the stationary vehicle.

2.6.7 *Back-up Lights or Rearward Warning Devices*—There are occasions when a vehicle moving in reverse can be thought by an oncoming driver to be a stationary vehicle. The installation of back-up lights will provide a reasonable and adequate warning of the driver's intention to move the vehicle in reverse, and such lights should be activated automatically when the vehicle is placed in reverse gear. The installation of an audio-warning system at the rear of a vehicle, activated either by the driver or automatically when the vehicle is placed in reverse, should be considered in the case of trucks, buses and other heavy commercial road equipment (Standard 97-GP-15).

2.6.8 *Tinted Windshields*—It may be essential on large slanted windshields to tint the upper portion to absorb the heat rays. The tinting of windshields within the driver's field of view is, however, not acceptable. Such tinting has an adverse effect on the transmittal of light, and under night and some atmospheric conditions this is seriously detrimental to the driver's vision. In addition, such tinting reduces the ability of the driver to recognize red traffic lights and other signal lights.

2.7 INSTRUMENTS AND INDICATORS—The driver should always be kept aware of the operating condition of his vehicle, by the use of instruments and indicators. Instruments essential to the control and safe operation of the car should be located immediately in front of the driver and in such a position that only a minimum of head or eye movement is required to determine any malfunction. Only the communicative function of the instrument need be incorporated in the instrument panel. This might best be accomplished by means of lights marked to indicate failure of any operating components or loss of efficiency below the acceptable safe level. Such an arrangement of instrument lights should in no way adversely affect the driver's vision.

2.7.1 *Indicators*—The indicators showing the proper functioning of turn-signal lights and high-beam headlights are important for safety. Turn-signal light indicators should be both audible and visible, and sufficiently attention-getting that the chances of siezed signals continuing to flash are minimal. They should clearly indicate when any turn signal is not functioning. High-beam lights may cause glare; the

high-beam indicator on the inside of the car should therefore be readily seen.

2.7.2 *Brake Indicator*—With the introduction of split-brake systems, the driver must be immediately warned of any failure in the operating components. These factors have been included in 97-GP-9.

2.7.3 *Speed-Warning Device and Speedometer*—In order to assist and encourage drivers to maintain posted highway speeds, an audible speed-warning device, functioning in conjunction with the speedometer so that it can be manually adjusted by the operator, would greatly assist in controlling automobile highway speeds. Present speedometers are only marginally related to safety. Consideration should be given to other means of presenting information on speed that would be more directly related to safety.

2.7.4 *Instrument Warning Lights*—Warning lights could replace instruments, and be located on the instrument panel and suitably labelled to indicate the functional failure of a component.

2.8 *TIRES*—The considerable public concern about tire quality is a recognition of the fact that tires are an extremely important part of vehicle safety.

2.8.1 *Capacity*—The vehicles be fitted with tires (97-GP-14) having sufficient load-carrying capacity to handle safely within statutory speed ranges, under conditions of curb and accessory weights, plus 150 pounds for each passenger that can be seated, plus 200 pounds for cars or 300 pounds for station wagons as a luggage allowance. If any but short and infrequent trips with higher loadings are contemplated, larger or higher-capacity tires should be fitted. A decal or plate indicating proper tire inflation, size, etc., for load carried and including information pertaining to the trailer-car combination should permanently be affixed to the automobile in a conspicuous place.

2.8.2 *Snow Tires*—Snow tires provide increased traction, and some improvement in stopping in snow, through their deeper tread pattern, losing effectiveness as the tread is worn. The thick tread causes snow tires to generate more heat in flexing, and they may therefore be unsafe for continuous high-speed driving particularly in summer, and more susceptible than regular tires to failures due to overloading.

2.8.3 *Studded Tires*—Studded tires for winter driving substantially increase traction on icy and slippery surfaces and will reduce braking distances. Tires to be equipped with studs should be carefully selected as the installation pattern is very important if proper life and effectiveness are to be obtained. The effect of studs on the pavement by a rolling wheel is apparently negligible and any damage that may occur is offset by their safety value. It is important that the use of studded tires be confined to the winter months only. Such periods will vary throughout Canada.

2.8.4 *Tire Chains*—Tire chains provide the best form of traction (when ever difficulty is encountered) in deep snow, slush or ice, as they

greatly improve the tractive effort of the vehicle and its stopping ability. Once the difficult road condition has passed, the chains should be removed. Care must be taken in mounting, as improperly and loosely fitted chains can cause damage to tires.

2.8.5 *Hydroplaning*—It is well known that wet pavements degrade braking and cornering performance, and it has been proven that tires may actually become separated from the road surface by a film of water, and “hydroplane.” When this may happen depends on the speed, inflation pressure, water depth, road surface and tread pattern. A good tread pattern may provide an adequate measure of safety on normally wet pavements, but “hydroplaning” may occur with any tire operating in large deep puddles and the hazard may be severe since the loss of traction may be almost instantaneous. The likelihood of occurrence can be reduced by replacing tires well before their tread pattern is worn off and by driving with caution on puddled roads.

2.8.6 *Maintenance*—It is probable that most accidents ascribed to tires are due to lack of proper tire maintenance. New tires of original equipment quality, properly inflated and not overloaded, are safe at all reasonable speeds. Tires from which most of the tread has been worn, that are under-inflated or over-loaded, or are otherwise abused, are dangerous. Each tire tread pattern should have a conspicuous means of warning a driver that the tire has reached the danger point in its life and should be replaced. One of the chief differences between low and high-priced tires is in the length of time they will continue to give safe service. Inflation pressures should be checked frequently with the tires cold, and adjusted to the pressures specified in the owner's instruction manual. If the vehicle is to be run at high speeds or with abnormally high loads, the inflation pressure should be increased, but not more than the amount specified in the owner's manual since steering is affected by both over and under-inflation. The owner's manual should contain an amplification of tire pressure data and tire sizes for special operating conditions with particular emphasis on the relation between tire pressure, load, speed and safety.

2.9 VENTILATION—It is important to the driver and occupants of an automobile that clean comfortable air be circulated at all times. There should always be an intake of fresh air to reduce the possibility of carbon monoxide poisoning. In heavy traffic, particularly if the air intake is low, it is well to drive with the windows open. Snow should be brushed off the air intake before starting. A positive flue-type ventilation system, that not only ensures provision of fresh air but also improves defogging and defrosting of the glazed areas, would result in increased safety and better vision, particularly in heavy traffic.

2.9.1 *Pollutants Emission Control*—With an ever-increasing vehicle population and resultant traffic density, the toxic gases emitted from engines assume more importance. Under certain circumstances some constituents of vehicle exhaust may react to form irritating smogs. Also, individual pollutants such as carbon monoxide may be of

concern to drivers in dense traffic situations or to persons living alongside heavily trafficated roadways. Although currently available exhaust emission control devices may improve the problem further research is required by health agencies or other research organizations.

2.10 BUMPERS—Bumpers as currently designed afford little collision protection. Their chief function is to protect lights against minor impacts during parking. Variation of bumper heights reduces the efficiency with which this is achieved. The presence of bumpers, standardized as to height, is therefore desirable for safety (97-GP-10).

2.11 GENERAL—In addition to the particular features discussed in sections 2.1-2.10 it is of paramount importance that the basic vehicle structure, all its accessories and their assembly be in accordance with sound engineering practice. Standards for many components and tests for the functioning of many parts are found in the Handbook of the Society of Automotive Engineers.

3. Inspection and Maintenance

3.1 The safest engineered vehicle constructed today can become a hazard and a potential menace to society and the public safety if not properly maintained. Drivers appear to be more concerned with the outward appearance of their vehicle than its mechanical reliability. They will faithfully wash and polish their vehicles but neglect to keep them in good mechanical condition by ensuring that regular and frequent safety inspections are carried out.

3.2 SAFETY INSPECTIONS BY THE OWNER

3.2.1 Tires—Tire pressures should be checked frequently and adjusted to the figures in the owner's manual; improperly inflated tires can blow. Tire treads should be examined and tires replaced well before 80 per cent of the tread pattern has disappeared; "bald" tires are much more likely to skid on wet pavements. If undue tire tread wear is noted, professional attention is needed.

3.2.2 Lights—Signal lights that do not function, missing headlights, tail lights, and stop lights all create hazards that can cause accidents. All can be checked by anyone.

3.2.3 Steering—Undue play in the steering wheel, or a tendency for the vehicle to wander or to pull to one side of the road, should be obvious to any driver and indicate the need for professional attention. In addition, uneven tire wear is a good indication of serious steering problems.

3.2.4 Exhaust Systems—Faulty exhaust systems can cause excessive carbon monoxide concentration in the vehicle interior. The owner should be able to confirm the integrity of at least the exhaust pipe, muffler and tail pipe assembly. Since deadly carbon monoxide poisoning is an ever-present hazard, any doubt on the part of the owner concerning the proper functioning of the exhaust system should be referred to an expert for inspection.

3.2.5 Driving a vehicle with the truck lid partially open so disturbs the vehicle's aerodynamics that exhaust fumes are drawn into the car interior.

3.2.6 *Windshield Washers*—It is the responsibility of the driver to service the windshield washer to ensure an adequate supply of fluid. This should be checked with each fill of fuel.

3.3 SAFETY INSPECTION BY PROFESSIONAL OR ENFORCEMENT AGENCIES—Since the average owner is not competent or equipped to do more than limited inspections as outlined in 3.2, and in any case probably will not make them, there should be compulsory inspection by a competent professional or enforcement agency at regular intervals. It is suggested that the current issue of American Standard D7-1 Motor Vehicle Inspections, be used as a basis for such inspection.

3.4 MAINTENANCE—Inspection is useless unless the faults revealed are corrected. It is therefore obvious that a car that is properly inspected and maintained will be a safer car than one that is neglected.

4. *Design for Prevention of Injury*

The most careful driver, in a properly designed and maintained vehicle may through the fault of others, be involved in an accident; in any case, a momentary lapse on the part of any driver should not be a death sentence. Though the potential for saving lives through changes in vehicle design may sometimes have been exaggerated, it is possible to design a vehicle so as to increase the chances of survival in collisions, and to minimize injuries.

4.1 ENERGY ABSORPTION—The laws of physics show that when a vehicle is brought to an abrupt stop, the occupants and all loose objects in it continue forward with the velocity at the time of impact. If vehicle structures were rigid, occupants would be subjected to very high forces even in low-velocity collisions. If a vehicle is brought to a stop over a distance, the forces on the occupants, and the forces with which occupants strike portions of the interior of the vehicle in the "second collision," are reduced. For this reason, vehicles with bumpers that distribute loads to structural members capable of deformation, vehicles in which hoods, fenders, trucks, etc., can crumple, and vehicles with thick side structures protect the occupants more than more rigid vehicles. Though it may make repairs expensive, "crumpleable" metal is one of the most efficient energy absorbers known. Similarly, interior structures that deform when impacted produce less severe injuries than more rigid structures, particularly those that fracture brittly producing sharp points and edges. For safety, vehicles should be designed to absorb as much energy as possible in both the primary and secondary collision.

4.1.1 *Bumpers*—Though, as stated in section 2.10, the chief contribution to safety of many bumper designs is the protection they afford to signal and tail lights, bumpers do contribute to energy absorption by distributing loads and involving greater amounts of sheet metal in a crash. Bumpers could be much more effective if they were mounted well beyond the car body, either retractable or permanently, on linkages designed to absorb energy. Such linkages might be hydraulic shock absorbers, crushable metal honeycomb, rigid cellular plastic,

cellular or noncellular elastomers with high hysteresis, or metal brackets having slotted controlled shear action. Bumpers might also contribute more to reducing injuries, particularly to pedestrians, if they were relatively flat or slightly convex from the front so that more collisions would be glancing blows. Bumpers that have concave portions may tend to lock vehicles together upon impact.

- 4.1.2 *Padding*—With occupants who are not ejected from the vehicle during an accident, the vast majority of injuries are caused by the occupant coming into violent contact with parts of the interior of the vehicle. As many of these parts as possible should therefore be designed to deform, thus spreading the load and reducing stresses on the part of the body that strikes them. Padding of the dash and visors is a most common example, but similar padding on the corner and door posts, the header, the roof, the backs of front seats and the arm rests would be desirable. Soft spongy padding is all but useless in any serious accident. Padding should be as thick as possible and quite firm to achieve maximum protection. In addition, the structures under the padding should, as far as practical, be designed to deform (97-GP-2).

4.2 INTEGRITY OF PASSENGER COMPARTMENT—In the mass of sometimes conflicting statistics on vehicle accidents, one fact is most clearly established; under almost all circumstances it is safer to remain in the vehicle than to be ejected or “thrown clear”. Thus the passenger compartment should be designed to remain intact in front, back and side collisions and roll-overs.

- 4.2.1 *Door Latches*—The door latches should be designed to prevent accidental release from either inside or outside. Latches and hinges should keep the doors closed even though the vehicle structure is severely racked and strained (97-GP-5).
- 4.2.2 *Roof Structure*—The roof structure should be sufficiently strong so that it does not collapse when the vehicle rolls over. For vehicles such as convertibles and possibly some hardtops, it may be necessary to fit special roll bars. Sedans having center posts may resist collapse with minor or no modifications.
- 4.2.3 *Passenger Compartment*—The passenger compartment should also resist intrusion by parts external to it. Of particular importance is the steering column. Though present designs of steering columns and steering wheels do provide some protection for the driver in low-velocity collisions, in higher-velocity collisions the column is all too frequently forced into the passenger compartment and serious injuries to the driver result (97-GP-4). A steering column designed to collapse under stress only slightly less than what can be tolerated by the human chest, and a steering wheel designed to spread and cushion the load, would be very desirable.
- 4.2.4 *Motor-mount and Firewall Design*—Consideration should be given to motor-mount and firewall designs to prevent intrusion of the engine into the driver's compartment, though the amount of collapsible space that can be gained by this is limited because of the normal rigidity of the front suspension system.

4.2.5 *Trunk Compartment Divider*—The division between the passenger car trunk and the passenger compartment should be sufficiently strong to resist penetration by jacks, tool boxes, etc., which may be projected forward when the vehicle is brought to an abrupt stop (97-GP-28). In the case of the luggage area in Station Wagons especially when the load consists of passengers and luggage consideration should be given to providing a means of securing such material by the use of webbing similar to Aircraft design.

4.3 *Interior Impact Hazards*—In addition to the hazard of hitting structural components (4.1.2), vehicle occupants may contact switches, knobs, levers, mirrors, coathooks, radio controls, door handles, etc. In general, these have relatively small areas that can cause serious penetrating and lacerating injuries. Standard 97-GP-3 lays down some requirements for their location and size, but ideal solutions are not easy. Controls cannot all be located outside the area likely to be impacted by occupants, nor can they all be recessed. The occupants, and in particular the driver, must be able to reach and manipulate controls readily even when wearing lined gloves. There would be little point in decreasing the likelihood of injuries in an accident by procedures that would increase the likelihood of an accident. Much can be done, however, to improve the design and location of controls from a safety standpoint.

4.3.1 *Rear-View Mirror*—A further hazard is the rear-view mirror. In addition to the break-away mount specified in 97-GP-16, the edges of the mirror should be shaped to reduce hazards.

4.3.2 *Seats*—Though seats must have a rigid structure, this structure should be padded, particularly on the upper portions of the backs of front seats, which are likely to be hit by rearseat occupants (97-GP-21).

4.3.3 *Door and Window Controls*—Door and window controls may be hazardous in side collisions. The possibilities of partially recessing them, shielding them by broad or energy-absorbing elbow rests and locating them in less hazardous positions have not generally been fully exploited (97-GP-18).

4.3.4 *Ash Trays*—Ash trays must be located for convenient use but they should be designed without sharp edges and corners, and to collapse inward readily if struck (97-GP-19).

4.3.5 *Under-Dash Area*—The parking brake control, heaters, and radios and other protuberances below the dash frequently have sharp rigid parts that are very likely to be struck by legs and knees in a front-end collision. More thought should be given to the design and location of these from a safety stand-point.

4.3.6 *Glove-Compartment Doors*—Although few accidents can be attributed to glove-compartment doors (especially open doors), severe injuries have occurred during impact or sudden braking. Glove-compartment doors should be designed to maximize the likelihood of the door remaining closed. Logic suggests that in the case of an accident it is better to strike the instrument panel area with the glove-compartment door closed than with it open.

4.4 RESTRAINT TO OCCUPANT—If car occupants could be prevented safely from flailing around in the “second collision”, injuries would be very greatly reduced.

4.4.1 *Restraining Devices (Seat Belts and Shoulder Harnesses)*—The majority of fatalities and serious injuries to occupants of automotive vehicles are caused by the occupants striking the interior of the vehicle (secondary collision) or by being ejected from the car. To minimize injury and fatalities, a number of methods are available for holding the occupants in their seats, and for ensuring that areas of the interior with which the occupant might come in contact are so designed as to minimize the risk of serious injuries. This can be accomplished by:

- (a) Provision of adequate door latches and hinges to reduce likelihood of ejection (Standard 97-GP-5).
- (b) Provision of restraining devices to prevent total ejection (97-GP-1).
- (c) Provision of a lap belt and shoulder harness either as separate units or combined (97-GP-1).
- (d) Designing the interior of the vehicle to minimize injuries (97-GP-2, 97-GP-3 and 97-GP-4).

Because of the limited acceptance and usage of restraining devices by the general public, the injury attenuation features designed into the present automobile should not be dependent upon their permissive use, and every effort should be made to increase their use, both through education and through making them more comfortable and convenient to wear.

4.4.2 *Lap Belts*—Lap-type seat belts are now almost universally available. When worn, they prevent complete ejection even if doors open, and they restrict the maximum forward movement of the wearer. They do save lives and reduce serious injuries, but they do not prevent the body from hinging forward to the extent that the head may strike the dash, windshield or controls, especially if the seat belt is not done up tightly. Another reason for fastening seat belts tightly is that they then transmit loads to the pelvic girdle, the strongest part of the human anatomy. When belts are worn loosely, forces may be absorbed by the abdomen and serious injuries may result (Standard 97-GP-1).

4.4.3 *Upper-Torso Restraint*—Much greater protection is obtained by the combination of lap and upper-torso restraint since this not only prevents “jack-knifing” of the body but also distributes the load over a greater area of the body (Standard 97-GP-1).

4.4.4 *Seat Belts energy absorption*—In addition to serving as restraints, seat belts also acts as energy absorbers. Their efficiency in this regard might be improved either by engineering the webbing so that it absorbs more energy in stretching or by fastening nonstretching belts to anchors designed to yield plastically.

4.4.5 *“Whiplash (Hyperextension Injuries)”*—“Whiplash” is one of the leading causes of injuries to occupants of automobiles involved in

rear-end collision, due to lack of adequate head restraint while under impact. This situation can considerably be alleviated by restricting the rearward head motion during impact by using either head supports (head rests) or seat construction that is above shoulder height. (97-GP-22). Consideration should be given to extending the application of this standard to include standard commercial trucks. Head rests may, however, restrict vision to the rear and sides; and flimsy "add-on" head supports may have inadequate strength to provide protection and may break on impact leaving jagged metal spears.

4.4.6 *Safety Helmets*—Well-designed safety helmets have proven an effective means of attenuating head injury for motorcyclists. Since the majority of automobile accidents involve injuries to the head, the wearing of protective head gear would be a considerable advantage. The design and development of an attractive, comfortable but effective head protector is worthy of consideration.

4.4.7 *Contoured Seats*—The movement of occupants in a crash can also be controlled to a considerable extent by contoured seats. Since not only comfort but safety might be enhanced by seats that provide considerable restraint to lateral movement, these warrant further study.

4.5 **RESTRAINT OF OBJECTS IN PASSENGER COMPARTMENT**—Other objects in the passenger compartment may become hazards in a collision. Since heavy objects should never be placed on the rear shelf behind the back seat, the rear shelf should be designed so as to prevent the storing of such items on it. Seats should be firmly anchored and the backs of folding seats should be fitted with secure locking devices (97-GP-6).

4.6 **FIRE PREVENTION**—Fires resulting from collision represent only a small part of the over-all accident picture, yet the results can be disastrous. Fires usually occur in the engine compartment as a result of accidental fuel spillage or electrical short circuits.

4.6.1 *Fuel Tanks*—In collisions, fuel tanks can break away, rupture or spill their contents through the filler pipe, thus creating fire hazards. Consequently, fuel tanks should be securely mounted in locations that are reasonably shielded from damage in collision from all directions and that are at the same time as remote as possible from the passenger compartment. The filler-cap should be so located and secured that it is unlikely to come off accidentally. Consideration might be given to fitting a check valve in the filler pipe to prevent spillage when the vehicle is on its side or inverted (97-GP-25).

4.6.2 *The Electrical System*—The electrical system should be provided with adequate fuses or circuit breakers to eliminate as far as possible fires caused by circuit overloading. A means of automatically switching off the electrical system might assist in preventing fires in cases of roll-overs and high-impact collision.

4.6.3 *Fire Retardant Material*—The materials used in padding, upholstering, and interior decoration of vehicles, should be fire resistant, so that they do not contribute to fires in the passenger compartment.

4.7 PEDESTRIAN HAZARDS—Accident statistics indicate that approximately one-quarter of all vehicle traffic accident fatalities involve pedestrians. The front end, sides, and wheels of vehicles should therefore be completely free from all nonessential protuberances (97-GP-27). Outside accountrements necessary for rearward vision or reference points should be constructed to collapse under a predetermined impact loading. Bumpers should be of flat configuration devoid of hook shape, to prevent snagging of clothing or objects carried by pedestrians; and should insofar as possible be designed so that in the case of contact the pedestrian would be carried to the outer edges of the vehicle. Some researchers seem to indicate that a wedgeshape up-sloped front end is less likely to injure pedestrians in the low-speed range of 20-25 mph than the flatter configurations. Since adult pedestrians are frequently thrown up onto the hood, the hood should be constructed to deform and absorb the energy of impact. Side gas-filler doors should not be of the type that can remain in the open position. Wheels should not have hub caps with protruding projections. Chrome stripping or its equivalent along the side of the vehicle should either be omitted entirely from automobile design or properly secured to prevent the snagging of clothing.

Subappendix (i)

ALPHABETICAL INDEX

Part II

GUIDE TO AUTOMOTIVE SAFETY

	Part II	Std.
Accessories—General summary	2.11	
Adjustability—Seat, steering wheel, controls	2.2.4	
Anchorage for restraining devices		97-GP-1
Anchorage for seats		97-GP-6
Arm rests		97-GP-20
Ash trays	4.3.4	97-GP-19
Ash tray illumination	2.6.5	
Automotive vehicle definition	1.2.1	
Back-up lights	2.6.7	97-GP-15
Brakes, disc	2.3.3	
Brake, fade, moisture, etc.	2.3	
Brake, front & rear distribution	2.3.4	
Brake indicator	2.7.2	97-GP-9
Brake metering device	2.3.4	
Brakes, non-locking	2.3.2	
Brake power assisted	2.3	
Brakes, self-adjustment	2.3.5	
Brakes, split	2.3.1	
Brake system—Dual operation	2.3.1	97-GP-9
Brake systems	2.3	97-GP-9
Brakes, trailers	2.3

Committee Ballot Draft
October 1966

CANADIAN GOVERNMENT SPECIFICATION BOARD GUIDE TO TRAFFIC SAFETY

PART III

THE ENVIRONMENT

1. *Objective*

- 1.1 The objective of this section of the Guide to Traffic Safety is to give the best available information for the identification and control of factors involving environment that either contribute to or mitigate against automotive vehicle safety.

2. *Introduction*

- 2.1 Although the responsibility of the driver has been mentioned several times in the Guide, it must be re-emphasized that full responsibility for the control of the vehicle rests with the driver. He cannot reasonably expect that improvements in vehicle or highway design and construction will relieve him of that responsibility. When any of the factors affecting his driving task—the vehicle, the highway, the weather, or the condition of the driver himself—are at less than optimum conditions, it must remain the responsibility of the driver to adapt his driving to compensate for existing deficiencies.
- 2.2 Existing information will undoubtedly be altered with advancing knowledge and will require future modification of the recommendations now made.

3. *The Role of The Road*

3.1 *Basis of Design*

- 3.1.1 The safety of motorists and pedestrians has been one of the prime considerations governing road and street design and operation since the highway and traffic engineering professions came into existence during the second decade of this century. Highway engineering is most frequently defined in terms of the provision of roads and streets for the safe, comfortable, convenient and economical movement of persons and goods. The keystones of traffic control are engineering, education and enforcement, the three inseparable elements of any program to produce maximum safety and optimum service for road users. Practically all geometric design standards for roads (i.e., maximum curvature, maximum gradient, rate of change of gradient and lane width) have been developed on the basis of

safety experience and the analysis of vehicle operating characteristics. Traffic signs, signals, pavement markings and intersection channelization are designed to reduce the demands on driver ability and hence reduce accidents by minimizing potential conflicts between the travel paths of vehicles and pedestrians.

- 3.1.2 A great deal of research on road safety has been done by the highway and traffic engineering professions and probably half of all the technical literature in this field is either directly or indirectly concerned with this problem. The remainder of the research and literature deals with such matters as the structural design of pavement, bridges and embankments, economics, planning, and maintenance. Despite these efforts, the relationship of traffic accidents to roadway design and traffic control has not been mastered, and further intensive research is required to obtain the data needed to guide and support the engineering decisions that must be made to reduce accidents.

3.2 *Road Classification*

- 3.2.1 Roads and streets are used for public transportation and are basically designed to provide traffic service and land service. Traffic service is concerned with the movement of vehicles through some distance in a minimum amount of time and with the greatest comfort, convenience and safety. Land service is concerned with access to properties such as industries or residential dwellings where all movements originate or terminate. Ideally, each road or street facility should be designed to provide a particular service but this is generally impracticable. A wide range of uses and users must be accommodated on one highway, road or street, and compromises in design must be made.
- 3.2.2 To reduce to more manageable proportions the engineering problems associated with planning, design and operation, roads have been classified into eight basic types. This road classification is used throughout Canada and consists of Freeways, Arterials, Collectors and Locals in both rural and urban areas. Definitions of each of these road classifications are contained in Table I. The characteristics of each of the road classes are shown in Tables II and III.
- 3.2.3 All classes provide service to traffic and, with the exception of Freeways, also provide direct access to land. Freeways and Arterials serve through-traffic movements while local roads are used almost exclusively for land access. Collector roads in both rural and urban areas provide a combination of traffic service and land service. As each type of road has different operating characteristics, the engineering designs for each also differ in order to accommodate these conditions.

3.3 *Perception—Judgment—Reaction Time*

- 3.3.1 For any road class, accident rates increase in proportion to the difficulty of the driving task. Demands upon the driver's ability are increased by the presence of more vehicles, intersections, driveways, and changes in operating conditions. The principal objective of road

design is to minimize the demands by providing the driver with sufficient time to cope with each new situation. The time required by the driver to take the necessary action is usually subdivided into the times necessary for perception, judgment and reaction. These times have been measured, and standards for such roadway features as passing sight distance have been developed to provide the required time for maximum planned operation speeds.

TABLE I ROAD CLASSIFICATION—1964

Rural Freeways—Rural Freeways are intended to accommodate the movement of large volumes of traffic at high speeds under free-flow conditions. Rural Freeways connect the larger cities, industrial concentrations and recreational areas. They also serve as major highway routes through intensely developed areas, and serve larger international and interprovincial travel movements. The need for unrestricted traffic movement on these facilities justifies the elimination of direct property access. Ultimate development will require grade separation at all crossing roads.

Rural Arterial—Rural Arterial roads are intended to move large volumes of traffic at high speeds. The chief distinction between this class and the Freeway class is in the full control of access. Roads that have full control of access should, without exception, be in the Freeway classification. Rural Arterial roads, together with Freeways, serve as the major routes in a network connecting the major economic regions and centers of a province such as large cities, industrial concentrations, agricultural areas and recreational facilities. Arterials carry large traffic volumes moving at high speed; direct access to abutting lands may be restricted or even eliminated.

Rural Collector—Rural Collector roads collect traffic from Local roads and feed it to Arterials, or distribute it from Arterials to Locals. They generally form an integrated network throughout all developed areas of a province and provide direct traffic service for developments such as tourist areas, mining areas and the smaller towns and villages. Rural Collector roads have a land service function of equal importance to their traffic service function in that they directly serve the adjacent properties.

Rural Local—The main function of Rural Local roads is to provide land access. The only traffic service function of a Local road is to allow vehicles to reach the frontage of properties from the main highways. Development roads that serve one or two natural resource areas may be considered as Local roads until volume and function justify reclassification.

Urban Freeways—Urban Freeways are intended to accommodate heavy volumes of traffic moving at high speeds under free-flowing conditions. Urban Freeways connect major points of traffic generation and may serve as urban extensions or principal Rural Freeways and Arterials. They are intended to serve long-trip traffic between large residential areas, industrial or commercial concentrations and the central business district. To provide optimum mobility

for through traffic, service to adjacent lands is completely eliminated. No parking, unloading of goods nor pedestrian traffic is permitted.

Urban Arterial—Urban Arterial roads are intended to carry large volumes of all types of traffic moving at medium to high speeds. These roads serve the major traffic flows between the principal areas of traffic generation and also connect to Rural Arterials and Collectors. In urban areas without Freeways, Arterial roads provide the best quality of traffic service. Urban Arterial roads perform a secondary function of servicing adjacent properties. The amount of access permitted to these properties should not interfere with the primary function of moving through-traffic.

Urban Collector—Urban Collector roads provide both traffic service and land service. The traffic service function of this type of road is to collect from and distribute to the Local (land service) roads traffic on the Arterial (traffic service) roads. Full access to adjacent properties is generally allowed on Collectors.

Urban Local—The main function of Local roads is to provide land access. Direct access is allowed to all abutting properties. Local roads are not intended to move large volumes of traffic. The Local road primarily carries only traffic with an origin or destination along its length. It is not intended to carry through traffic other than to immediately adjoining roads. Local roads may be residential, commercial or industrial depending on the adjacent land.

-
- 3.3.2 An accident can occur when a driver fails to perceive, or incorrectly perceives, a situation. The engineer makes every effort to ensure that the driver perceives each new situation by providing properly designed signs located where they may be seen by all drivers well in advance of the changed condition. Roadway designers also strive to avoid alignments where a driver may not perceive a situation in its true perspective; drivers have been known to fail to negotiate curves under such conditions.
- 3.3.3 When a changed situation has been perceived by a driver, time is required to make a judgment as to the action that must be taken. If multiple complex decisions must be made at a single time, greater strain is placed upon the driver's ability and the judgment time may be increased. Engineers endeavor to minimize multiple decisions which lengthen judgment time and produce potential accident situations.
- 3.3.4 After a situation has been judged, the driver requires time to take action. This action may consist of applying brakes or seeking refuge on a shoulder to avoid collision. For these reasons, roadway designs must provide alternative opportunities for action such as wide shoulders as refuge for vehicles, and pavements with high skid resistance so that a vehicle may stop in a minimum of time.

3.4 *Accident Cause and Severity*

- 3.4.1 It is evident that when roadways have been designed with a minimum of demands upon the driver's ability and with sufficient

time to allow for perception, judgment and action, it is necessary to ensure that the operating rules for which the roadway was designed are enforced. It is also evident that for any roadway there will always be some demands upon the ability of all drivers. Therefore, it is necessary to ensure that human judgment is not impaired by alcohol, drugs and physical or mental handicaps.

3.4.2 In addition to reducing accidents, roadway design is concerned with reducing the severity of accidents. Engineers attempt to reduce the number of obstacles adjacent to the roadway with which a vehicle might collide when out of control. Considerable attention is also given to the selection of side slopes, back slopes and ditch cross-sections, so that the driver of a vehicle that has left the roadway may be able to regain control before it collides with some obstacle or overturns.

TABLE II
CHARACTERISTICS OF RURAL ROAD CLASSES

	Rural Freeways	Rural Arterials	Rural Collectors	Rural Locals
Traffic service	Optimum traffic movement	Traffic movement primary consideration	Traffic movement and land access of equal importance	Traffic movement secondary consideration
Land service	No access	Land access secondary consideration		Land access primary consideration
Range of average daily traffic volume, vehicle/day	More than 8,000	1,000-12,000	200-5,000	Not applicable
Characteristics of traffic flow	Free flow	Uninterrupted flow except at signals	Interrupted flow	Interrupted flow
Average running speed off-peak condition	45-60 m.p.h.	40-60 m.p.h.	40-50 m.p.h.	30-50 mp..h.
Vehicle type	All types heavy trucks average 20 to 30%	All types 10 to 20% trucks	All types, up to 30% trucks in the 3-5 ton class	Predominantly passenger cars; light to medium trucks; occasional heavy trucks
Percentage of miles	up to 5	5-10	10-20	65-85
Percentage of vehicle-miles	0-40	40-70	15-25	2-15
Connects to	Freeways Arterials Collectors	All classes	All classes	Arterials Collectors Locals

TABLE III
CHARACTERISTICS OF URBAN ROAD CLASSES

	Urban Freeways	Urban Arterials	Urban Collectors	Urban Locals
Traffic service	Optimum traffic movement	Traffic movement primary consideration	Traffic movement and land access of equal importance	Traffic movement secondary consideration
Land service	No access	Land access secondary consideration		Land access primary consideration

4. Accidents Rates

4.1 Accident Reports

4.1.1 Throughout Canada all accidents involving more than one hundred dollars property damage are reported on standard forms. These forms are generally completed by a police officer on road patrol duty but may, in some cases, be submitted to either the police or motor vehicle registrar by the persons involved. The accident-reporting forms are not identical in each province as they are designed to provide other information required by local legislation. The accident reports are used by the police and highway officials to maintain traffic accident records to:

- 4.1.1.1 Identify particular traffic accident problem areas so that officials of provincial or local governments may take action to correct unusual situations.
- 4.1.1.2 Provide data for highway and traffic engineers responsible for roadway design and operation.

- 4.1.1.3 Provide facts for the education of the motoring public.
- 4.1.1.4 Assist the police in the supervision of roadways and enforcement of regulations.
- 4.1.1.5 Provide information to Motor Vehicle Branches regarding the driver's financial responsibility.
- 4.1.2 Accident reports must be designed to provide adequate information for each of these purposes. As there are a great number of circumstances that must be recorded for each accident, and as in 1964 there were in excess of 360,000 traffic accidents in Canada involving nearly 4,000 fatalities, it is a formidable task to record with sufficient accuracy all the information required. As a result, there are deficiencies in accident statistics throughout Canada, particularly in the detailed information contained in the reports for individual accidents. There is a need for further co-operative effort by all agencies involved in this problem throughout Canada to improve accident reporting procedures and the analysis of this information.

4.2 *Use of Accident Information*

- 4.2.1 Highway and traffic engineers make extensive use of accident reports to:
 - 4.2.1.1 Identify and treat multiple accident locations.
 - 4.2.1.2 Evaluate the relative safety of different geometric design features such as lane width, shoulder width, curvature, gradient and side sloped.
 - 4.2.1.3 Evaluate the effectiveness of improvements in the design of hazardous locations, or identify substandard sections of road that should be assigned high priority for reconstruction or improvement.
- 4.2.2 Accidents occurring at road intersections are generally identified by location and analyzed to determine the causes and corrective measures required to prevent recurrence. To evaluate sections of road, accident rates are normally calculated. These accident rates are expressed as:
 - (a) Accidents permillion vehicle-miles
 - (b) Fatal accidents per hundred million vehicle-miles
 - (c) Fatalities per hundred million vehicle-miles.

Accident rates as expressed above take into consideration the relative exposure to accidents on roadways with different amounts of traffic and therefore may be used to compare the relative safety of the roadway design.

- 4.2.3 All Provincial highway departments in Canada, as well as the road departments of the same municipalities, analyze accident data at multiple accident locations and on short sections of highway. Most highway departments calculate accident rates per million vehicle-miles for highway sections in order to compare their relative safety. Not all highway departments, however, calculate accident rates for road systems because it is difficult to make accurate estimates of the total travel on each system as opposed to the travel on a short

section of road where traffic counts are available. Accident rates for a system are not particularly useful for engineering analysis because of the differences in topography, environment and design that occur over the system. The data in Table IV do, however, indicate the current accident rates for different classes of road and the influence of design and operating conditions on accident occurrence.

4.3 Accident Rates on Road Classes

- 4.3.1 It will be noted in Table IV that the accident rates on urban streets are between three and four times as great as on rural roads. This may be attributed to the greater demands placed upon a driver's ability by the presence of more cars, intersections and changes in operating conditions. This is substantiated by the fact that the accident rates on freeways in urban areas in both Canada and the United States range between 1.0 and 3.0. These low rates result from the separation of opposing traffic by medians and the elimination of level crossings, traffic lights, stop signs and pedestrians. A recent study of a freeway and multilane-divided arterial street with intersections at grade, serving the same corridor in a city, showed that the freeway had an accident rate of 3.5 compared to the arterial street accident rate of 29.0. Although there are relatively few miles of urban freeway in Canada, substantial differences in the accident rates have been found where comparisons of this type were possible. Numerous studies in the United States have found similar differences, emphasizing the importance of roadway design.

TABLE IV
1964 ACCIDENT RATES

(Number of Traffic Accidents per Million Vehicle-Miles of Travel)

	Ontario	Saskatchewan	Manitoba	U.S.A.
Urban Freeways.....				2.0
Urban Arterials.....				5.0
Urban Collectors.....				
Urban Locals.....				
All Urban Streets.....	8.5	12.3		
Rural Freeways.....	1.7	1.2		2.0
Rural Arterials.....	2.7			
Rural Collectors.....	3.1	2.4	2.1	4.0
Rural Locals.....	5.6	5.6		
All Rural Roads.....	3.1	3.4		
All Roads and Streets.....	5.3	5.7	5.9	

NOTE: More data may be obtained to complete this table and make it more representative.

- 4.3.2 In Table IV it will also be noted that accidents rates on rural Freeways are substantially lower than those on arterial, collector and local rural roads. This may be attributed once again to the

elimination of intersections and pedestrians and to the separation of traffic moving in different directions. Accident rates on rural arterial roads are lower than on collector and local roads in rural areas because of the improved geometric design of these facilities, the control of intersections at grades, traffic regulations suited to design and environment, and greater enforcement of driving rules and roadway regulations.

- 4.3.3 The importance of roadway design is further illustrated by the following data obtained in a study "Accidents on Freeways in California" by Karl Moskowitz;

Type of Roadway	Accident Rate per Million Vehicle-Miles
Multilane, undivided, no access control	4.09
Multilane, divided, no access control	2.91
Multilane, divided, partial access control	1.69
Multilane, divided, full access control (Freeway) ..	1.00

Studies of the Bureau of Public Roads in the United States have found a fatality rate on the Interstate (freeway) rural highway system of 2.8 deaths per hundred million vehicle-miles compared with a rate of 9.7 deaths per hundred million vehicle-miles on the older highways they replaced in the same corridors. In these studies the only variable of consequence was the design of the road.

4.5 Road Improvements

It is apparent that the total number of traffic accidents in Canada can be reduced through the provision of better roads. This is achieved mainly by reduction in the demands upon the driver's ability through the reduction or elimination of intersections, separation of pedestrians and vehicular traffic, by providing sufficient time for perception, judgment and reaction where roadways conditions change. It would be impossible to replace the more than 400,000 miles of road in Canada with freeways, but freeways could be provided to carry as much traffic as is economically feasible, while the geometric design of older roads could be improved to modern standards. A very significant percentage of single-car accidents occur on straight level sections of highway under ideal conditions. Consequently improvements in geometric standards to older roads, including freeway treatment, must be carefully evaluated.

Road Design

5.1 Design Features and Accidents

- 5.1.1 As indicated in the previous section, there are significant differences in the accident rates for each road class because of the distinctive design features and operating characteristics of the facilities provided. This was particularly evident in the case of freeways where the accident rates were from one third to one-tenth of those for arterial and collector roads. In addition to general roadway design, there has been considerable research in Canada, the United States, Great

Britain and elsewhere into the relationship between traffic accidents and the individual elements of the geometric design of roadways. The following statements represent some, though by no means all, of the important conclusions regarding geometric design that have been developed in the many investigations undertaken:

- 5.1.1.1 Where all other conditions are equal, accident rates increase progressively as the width of pavement lane decreases progressively below 12 feet.
- 5.1.1.2 Accident rates are higher on roads with narrow shoulders, particularly less than 6 feet in width.
- 5.1.1.3 Accident rates are significantly lower where opposing traffic is separated by medians. The accident rate is also affected by the cross-section and width of medians; depressed grass medians more than 60 feet wide have the lowest rates.
- 5.1.1.4 Median barriers of suitable design are effective in reducing the severity of accidents.
- 5.1.1.5 The severity of accidents can be significantly reduced by providing gentle side slopes and back slopes in the order of 6 to 1 with rounded ditch bottoms.
- 5.1.1.6 Accident rates are higher where bridges are narrower than the full width of pavement and shoulders.
- 5.1.1.7 Accident rates may be decreased by increasing the skid resistance of the pavement surface.
- 5.1.1.8 Where other conditions are equal, accident rates increase where the horizontal curvature on roadways exceeds 3 degrees. (A 3-degree curve is a horizontal curve in which the angle at the center of the curve subtended by a cord 100 feet long on the center line of the curve is equal to 3 degrees.)
- 5.1.1.9 Accident rates increase as the gradient of a road increases.
- 5.1.1.10 Accident rates at intersections depend upon design and are higher for acute-angled intersections than for right-angled or T-intersections.
- 5.1.1.11 Accident rates have been observed to increase where the length of passing sight distances decrease and where the frequency of passing restrictions increase.
- 5.1.1.12 Accident rates at intersections generally increase with traffic volume and with increasing delays to vehicles.
- 5.1.1.13 Accident rates increase where obstacles are close to the pavement edge.
- 5.1.1.14 Accident rates at intersections can be reduced by providing roadway lighting.
- 5.1.1.15 Accident rates at railway grade crossings can be reduced progressively by the substitution of bells, flashing lights, wig-wags and gates for warning signs.

- 5.1.1.16 Accident rates are reduced where two-way streets are converted to one-way operation.
- 5.1.1.17 Accident rates are reduced by the prohibition of curb parking.
- 5.1.1.18 The numbers of accidents and their severity can be reduced by providing guardrails, guide posts, delineators, fencing and pavement edge markings.

5.2 *Design Standards*

- 5.2.1 In Canada, all provincial highway departments, federal government departments responsible for roads, and the road departments of most municipalities design all new roads and reconstruct existing roads according to the recommendations contained in the Manual of Geometric Design Standards for Canadian Roads and Streets. This Manual was published by the Canadian Good Roads Association in 1963 after four years of preparation by committees consisting of close to one hundred of the best design engineers of all major road departments in Canada. In this Manual, the functional classification of roads outlined in Table I has been subdivided into 34 geometric design classes on the basis of design speed. Design speed was used to permit differences in quality of the road that might be necessitated by terrain or regional economic factors.
- 5.2.2 For each of the 34 road classes, standards were established for:
 - 5.2.2.1 Alignment elements (gradient, curvature, sight distance)
 - 5.2.2.2 Cross-section elements (lane width, shoulder width, side slopes)
 - 5.2.2.3 Intersections (alignment, channelization, auxiliary lanes, turning radii)
 - 5.2.2.4 Grade separations and interchanges warrants, types, clearances, ramps, weaving sections)
 - 5.2.2.5 Illumination (intensity, warrants, maintenance)
- 5.2.3 In addition to recommending standards for each element of the geometric design of roads and streets, this Manual places great emphasis on the need for achieving consistency in geometric design throughout a particular route. The Manual stresses the need to avoid abrupt changes in alignment, unexpected deviations from the general standards of a section and displeasing or hazardous combinations of horizontal and vertical alignment. It is believed that the standards contained in this book will produce the safest possible design for each class of road or street. Continuing committees have, however, been established to modify these design standards as further information is obtained. Research is being carried out in Canada to evaluate modifications to these standards. Research on geometric design being carried out in other countries is also being carefully studied so that modifications to these standards may be made as significant findings become available.

5.3. Road Improvements

All highway departments attempt to identify multiple accident locations; accidents at such locations are analyzed and, where causes can be identified, these locations are reconstructed to eliminate the hazard. Many highway departments are evaluating the skid resistance of pavements and, where the coefficient of friction is low, are attempting to correct deficiencies by the provision of new skid-resistant surfaces. All highway departments are also attempting to improve roadside development and the aesthetics of roads by landscaping and the removal of unnecessary advertising signs and similar distractions that may be hazardous.

6. Road Operations

6.1 Uniform Traffic Control Devices

6.1.1 With adequate road design, conforming to the Manual of Geometric Design Standards for Canadian Roads and Streets, the safety of a particular section of road depends upon the "rules of the road" and the adequacy of traffic control devices. In January 1960, the Canadian Good Roads Association published the first Manual of Uniform Traffic Control Devices for Canada prepared during a period of four years by a number of expert committees composed of approximately one hundred traffic and highway engineers from all parts of Canada. This Manual was produced by the Council on Uniform Traffic Control Devices for Canada, which is jointly sponsored by the Canadian Good Roads Association and the Canadian Section, Institute of Traffic Engineers. The Council is composed of representatives of all Provincial government highway departments, the road or traffic departments of major municipalities, the Government of Canada, and national associations. The Manual contains standards for traffic signs, traffic signals and pavement markings for use throughout Canada. See Figure I for examples.*

6.1.2 Over the following four years these standards were adopted and implemented by practically all jurisdictions in Canada. In May 1966 a major revision of the Manual was issued by the Canadian Good Roads Association. The principal changes involved the replacement of word messages by symbols on practically all road signs; symbolization of signs being introduced to aid the perception of signs and recognition of their messages by all motor vehicle users, and to overcome the need for bilingual messages in certain sections of the country. In general, the shapes and colors of signs conform to current North American practice, and the symbols being introduced are copies of, or improvements on, those used under international agreement in Europe. The development of these new symbol signs has involved extensive research to ensure that they will be easily recognized by all motorists in Canada as well as by visitors from the United States and Europe.

* A comprehensive set of warning and regulatory, in color, will be appended to the guide when issued.

6.1.3 The Manual of Uniform Traffic Control Devices for Canada contains:

- 6.1.3.1 Standards for the replacement of signs so that drivers will have sufficient time to perceive, judge and react to the message being conveyed.
- 6.1.3.2 Standards for the positioning of traffic signals so that motorists will be able to perceive them under the most adverse conditions; warrants for the installation of traffic signals and instruction on timing are included.
- 6.1.3.3 Standards for pavement markings, specifying the condition under which no-passing zones and edge markings should be placed and giving instructions for marking pavements in the field:
 - (a) Center line pavement markings consist of solid barrier lines, broken lines or combinations of the two
 - (b) Solid lines are designed to separate adjacent traffic lanes that accommodate traffic moving in opposite directions on two-lane roads or traffic moving in the same direction on multilane divided roads
 - (c) Solid-barrier lines are provided on 2-line roads to prevent traffic from entering the opposing lane when sight distances are definitely inadequate to see an approaching car in sufficient time to return safely to the proper lane
 - (d) Where solid-barrier lines do not exist, a driver may cross into the adjacent lane to pass a vehicle
 - (e) The absence of a solid-barrier line does not insure safe passing as this depends upon the distance to opposing traffic, the speed of the vehicle being passed and the acceleration characteristics of the passing vehicle
 - (f) Passing on a 2-lane road with a broken center line is a judgement situation.
- 6.1.4 It is believed that the standard traffic control devices specified in this Manual provide the greatest possible safety for motorists when properly used. The Council on Uniform Traffic Control Devices for Canada has, however, made provision for amendments to this Manual as the results of further research become available. It is in constant contact with similar bodies in the United States and Europe, and is itself sponsoring seventeen active research projects in Canada to evaluate modifications to the existing standards. In addition, another twenty research projects are in the planning stage.

From: Manual of Uniform Traffic Control Devices

Figure 1

6.2 *Rules of the Road*

- 6.2.1 The rules of the road that govern the conduct of motorists and pedestrians on public roads and streets differ somewhat from province to province. As an example, some provinces permit right turns on red lights, others do not. More seriously, the rights of way of motorists and pedestrians are not always clearly defined. In recognition of this, the Commissioners for Uniformity of Legislation in Canada in 1956 attempted to prepare uniform rules of the road for Canada. The draft legislation was adopted in one province but was found to be unacceptable in all others.
- 6.2.2 In an attempt to remedy the deficiencies in this document, the Traffic Operations Committee of the Canadian Good Roads Association undertook to review and revise the draft rules of the road in 1964. This committee is attempting to make these rules of the road consistent with best practice and with the recommendations contained in the Manual of Uniform Traffic Control Devices for Canada. Revision of these rules of the road for Canada is expected to be completed in 1966. The co-operation of all legislative and enforcement officials will then be sought to overcome any legal technicalities and ensure their adoption and implementation throughout Canada.

6.3 *Road Maintenance*

- 6.3.1 Road operations are greatly affected by the standard of maintenance on the road systems. Poorly maintained road surfaces can markedly increase the likelihood of accident involvement unless drivers take adequate precautions when conditions are less than ideal.
- 6.3.2 Many accidents can be attributed to snow or ice on the road surface. At the present time the provincial highway departments spend 56 million dollars a year on snow and ice removal from their road systems. A similar amount is spent by urban and rural municipalities. Expenditures for winter maintenance have more than doubled in the last ten years in an effort to ensure that all roads and streets may be used with safety throughout the year. Winter maintenance consists of ploughing snow, sanding and salting the icy surfaces. The public sometimes condemns the use of salt because of corrosion to automobiles, but there is ample evidence that the accident rate increases sharply when no freezing-point-depressant is used, and delays and congestion increase markedly also. Although highway departments in Canada probably provide the highest standard of winter maintenance of any country in the world, accidents do occur as a result of slippery surfaces during the winter.

6.4 *Road Construction*

- 6.4.1 In the reconstruction or repair of an existing road it is necessary to temporarily divert traffic or restrict normal traffic operations while the work proceeds. As these operations are generally required at specific locations on free-flowing, high-speed routes, they constitute an abrupt hazard that is extremely dangerous to both motorists and workmen. The problem is aggravated because reconstruction and

repair work generally must be carried out during the summer months when traffic volumes are highest.

- 6.4.2 To prevent accidents and minimize the discomfort and inconvenience to motorists, standard warning, guide and information signs are erected in advance of, and throughout, the work area. The design and positioning of these standard signs is specified in the Manual of Uniform Traffic Control Devices for Canada. Construction signs are used to warn traffic of hazardous conditions either on, or adjacent to, the road; the colors are, insofar as possible, yellow with black letters and symbols, and may be partially or totally reflectorized.
- 6.4.3 In addition to being specified in the Manual, details of construction signs, barricades and the use of flagmen are always included in the general provisions of provincial highway department contracts as a requirement in the performance of the work. Furthermore, the provincial and national construction associations and construction safety associations have further requirements for such traffic control as well as continuing educational programs for contractors, employees and the general public.
- 6.4.4 In spite of the standards and regulations governing the control of traffic on sections of road being reconstructed or repaired, such work is frequently carried out, particularly on secondary and local roads, with inadequate signing or flagmen to warn the motorists of the hazardous condition. Therefore, motorists should not only obey all construction signs and flagmen, but should be on the alert for projects where such traffic control is inadequate.

6.5 *Driver Characteristics*

- 6.5.1 Despite good geometric design and the provision of adequate traffic control devices, rules of the road and effective maintenance, accidents still do occur on all roads and streets. There is no doubt that the number of traffic accidents can be reduced by replacing large mileages of existing inadequate roads with expensive, modern facilities designed to reduce the demands upon driver ability to a minimum. However, it is not economically feasible to eliminate all demands upon a driver's ability, and the engineer must therefore rely upon reasonably good driving practices and adequate law enforcement.
- 6.5.2 Some pertinent results from the great many studies conducted in Canada, the United States and elsewhere indicate the following:
 - 6.5.2.1 (a) Improper driving for existing conditions is responsible for by far the greater majority of all traffic accidents and traffic fatalities.
 - 6.5.2.2 (b) On a particular highway, for a particular set of conditions, drivers settle into a pattern of speed of travel that reflects roadway conditions. Posted speed limits must therefore be realistic if the laws are to be obeyed.
 - 6.5.2.3 (c) The United States Bureau of Public Roads has demonstrated in its study "Accidents on Main Rural Highways" that the safest speed

is the average speed of all cars on a particular stretch of road. The likelihood of a car being involved in an accident is directly related to its deviation from the average speed of travel, whether it is going more quickly or slowly than the other cars in the traffic stream.

6.5.2.4 (d) The probability of accident involvement doubles at speeds 15 miles an hour above or below the average travel speed.

6.5.2.5 (e) There is no evidence that higher travel speeds, when compatible with modern highway facilities, result in increased accident frequency, there is evidence that accidents are more severe at higher speeds.

6.5.3 It is clearly apparent that:

6.5.3.1 Uniform traffic control devices must be properly installed on all roads and streets.

6.5.3.2 Traffic regulations, such as speed limits, must be realistic.

6.5.3.3 Uniform rules of the road for Canada must be adopted as soon as possible.

6.5.3.4 Drivers must be educated to these rules of the road.

6.5.3.5 Strict enforcement must be imposed to minimize the number of drivers who deviate from the rules and regulations.

6.6 *Weather Conditions*

6.6.1 Roads, vehicles, and driver regulations are designed primarily for "good weather" operations. Attempts are made by the designers to minimize the deterioration of roads and vehicles under adverse weather conditions but the onus remains on the driver to adjust to non-ideal conditions.

6.6.2 Weather affects two major factors in the driving task: visibility and traction. Conditions affecting visibility obviously include fog, darkness, and the various types of precipitation. However, strong sunlight at sunrise or sunset can seriously inhibit a driver's ability to see, especially if the situation is compounded by dirt on either side of the windshield. East-west roads are particularly affected in this way and warrant extra attention from drivers travelling in either direction. At night, even on divided thoroughways, if no provisions exist to shield approaching drivers from headlight glare, low beam lights must be selected, and speed must be reduced to keep stopping distance within the headlights' range.

6.6.3 Traction or friction between tire and road surface depends on many factors, including: road surface material and condition; tire size, design, amount of tread remaining, and inflation pressure; vehicle weight and speed; and, perhaps most significant, weather conditions. Aside from the obvious effects of snow or ice on the road surface, the driver should be aware that even light rain can reduce traction between tire and road appreciably, sometimes to only one-quarter of that for the same pavement when dry. At highway speeds in heavy rain (or if puddles are permitted to collect on the roadway) the vehicles' tires tend to ride atop a layer of water and hence have no

significant contact with the road itself. This condition, known technically as hydroplaning, can result in a loss of traction more severe than if the vehicle were on glare ice.

- 6.6.4 Road design and maintenance can only attempt to minimize the effects of non-ideal weather; in the final analysis the driver must make the necessary adjustments (usually increased attention and decreased speed) to assure that safety levels are preserved. Specific cautions for driving in adverse weather conditions are delineated in most books on driving techniques, for example "Sportsmanlike Driving."

7. Accident Analysis

7.1 Use of Accident Reports

- 7.1.1 A recent survey by the Canadian Good Roads Association showed that all ten Provincial highway departments make extensive use of accident reports provided by the police. In all Provinces, reportable accidents are considered to determine whether they are associated with a roadway deficiency. In most provinces, accident spot maps are maintained either by the police or the highway department and accident reports are filed by road intersections or control sections. These maps and files are used to identify multiple-accident locations. When such locations become apparent, the reports on all accidents are studied to determine how the design of the road section or intersection can be modified to reduce the accident potential. In most Provinces, formal procedures have been established to assign high priority for reconstruction to sections where accident rates are abnormally high.
- 7.1.2 In most Provinces, accidents are identified by key points on the road system such as nearby intersections or river crossings. In two provinces, mileposts are used by the police to identify accident locations. In most provinces, accident locations are reported to the nearest one-tenth mile, but in two provinces the highway departments do not consider it important that the accuracy of reported locations need be any greater than the nearest one mile. Accident reports currently used do not contain the detailed information needed for engineering analysis. In most cases it is difficult to determine from them whether the accident was due to the road, the vehicle, the driver or a particular combination of these. Blood alcohol content cannot always be determined so an accurate assessment cannot be made as to whether the driver was impaired. Vehicles are very rarely inspected by competent persons to determine whether the accident might be attributed to some mechanical defect. Notwithstanding the present difficulties, accident report forms should contain sufficient detail to determine if the road conditions contributed to an accident.

7.2 *Accident Investigation*

- 7.2.1 It is evident that more detailed and accurate accident reporting is needed throughout Canada so that this information can be analyzed to determine the most appropriate measures for combatting the problem. In addition to more accurate accident reporting, there is a need for detailed crash investigation research. As each traffic accident is unique and usually the result of a chain of events, there is need for detailed research by teams composed of engineers, doctors, lawyers and sociologists to delve into the basic underlying factors causing accidents. For example, certain road design features might have hypnotic effects on drivers or adverse influence upon persons with epileptic tendencies.
- 7.2.2 There are indications that, under certain roadway conditions, the operating characteristics of vehicles may alter significantly but the driver may not be able to compensate for the changes. Interdisciplinary teams of experts may be able to identify some of the basic underlying causes of traffic accidents through detailed investigation so that corrective measures may be taken.

7.3 *Engineering Analysis*

- 7.3.1 At the present time, accident data are analyzed by highway departments by means of personal appraisal of individual accident reports, collision diagrams at multiple-accident intersections, or analysis of accident rates on road sections.

7.4.1 *Personal Appraisal*

- 7.4.1 Highway departments examine the reports of each individual serious accident, as well as all reports at multiple-accident locations. In addition, some highway departments require district engineers to submit more complete reports on serious accidents, including photographs of the location, in an effort to attribute the accident to a specific cause.

- 7.4.2 In cases where a highway deficiency is responsible, corrective measures are usually devised and implemented promptly by the highway department.

7.5 *Collision Diagrams*

- 7.5.1 Collision diagrams, Figure 2, are used to analyze accidents at intersections by most provincial highway departments and by all city traffic engineers. These diagrams illustrate the intersection features together with the direction of travel of the vehicles and the manner of collision. The engineer then examines the diagram for features common to several accidents. If they can be linked to the roadway design, remedial measures are devised and improvements made. When such intersections are improved, future accident rates are studied to ensure that the deficiency has been corrected.

Collision diagram

Figure 2

- 7.5.2 Collision analyses of this type frequently lead to standard improvements that are implemented at other intersections to prevent possible accidents.

7.6 *Accident Rates*

- 7.6.1 Accident rates are computed for road sections as, accidents per million vehicle-miles and fatalities per hundred million vehicle-miles. For short road sections, these statistics can be estimated with reasonable accuracy from the number of reported accidents occurring within the section of road and measured traffic counts throughout the year. When accident rates on a section of road exceed a specified limit, the design of the road is studied in an effort to determine any design deficiencies that might be responsible.
- 7.6.2 When accident rates are calculated for road sections, it is possible to carry out statistical analyses to relate the rates to varying geometric design features on different sections. Such analyses have been used to show that wider pavement lanes have lower accident rates than sections of road with narrow lanes. Analyses of this type have also shown that fatality rates may be reduced through the use of flatter side slopes and back slopes, coupled with rounded ditch bottoms.
- 7.6.3 Statistical analyses to relate accident rates to road design features have, however, serious limitations as there are generally not enough road sections to compare the effects of rates of differences in a particular roadway element where all other design features are identical. Hence, an analysis could attribute high accident rates to traffic volume rather than to narrow traffic lanes because, for the sections studied, roads with wide lanes had low volumes and roads with narrow lanes shown high volumes. Statistical analyses of accident rates have provided useful results but, because of the limitations cited, detailed crash investigations are needed to isolate the true causes of accidents.

Recommendations

- 8.1 Although improper driving for the existing environmental conditions is responsible for by far the greatest number of all traffic accidents, the numbers of accidents and fatalities could be reduced by improved roads and operating conditions.
- 8.2 Traffic accident reductions through road improvements could be effected by:
- 8.2.1 Improved accident reports pinpointing accident locations and recording clear, accurate descriptions of the events and conditions together with the probable contributing factors.
- 8.2.2 Improved reporting methods devised through a co-operative effort by all agencies in Canada concerned with the use of this information.
- 8.2.3 Detailed investigations of traffic accidents by teams of specialists representing the sociological, legal, medical and engineering professions to determine the true causes of accidents and personal injuries.

- 8.2.4 Construction of more freeways to carry a higher percentage of the total motor vehicle travel in both rural and urban areas on systems that have been proven to reduce demands upon driver ability to a minimum, and in which accident rates have been proven to be substantially lower.
- 8.2.5 Preparation, adoption and implementation at the earliest possible date of a code of modern uniform rules of the road for Canada.
- 8.2.6 Implementation on all roads and streets of the standards contained in the latest edition of the Manual of Uniform Traffic Control Devices for Canada.
- 8.2.7 Adoption of realistic speed limits and other regulations on all roads and streets.
- 8.2.8 Strict enforcement of rules of the road and the regulations established for particular sections of road and street.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 12

TUESDAY, OCTOBER 25, 1966

Respecting the subject-matter of

Bill C-87, An Act to amend the Criminal Code (Impaired Driving)

WITNESSES:

Mr. Robert E. Malkin of Vancouver; and Mr. J. Douglas Tracy
of Little Current, Ontario.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron (*High Park*)

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,
Mr. Bell (*Carleton*),
Mr. Choquette,
Mr. Chrétien,
Mr. Fulton,
Mr. Goyer,
Mr. Grafftey,
Mr. Guay,

Mr. Honey,
Mr. Laflamme,
Mr. Latulippe,
Mr. MacEwan,
Mr. Mather,
Mr. McQuaid,
Mr. Nielsen,

Mr. Otto,
Mr. Ryan,
Mr. Scott (*Danforth*),
Mr. Tolmie,
Mr. Trudeau,
Mr. Wahn,
Mr. Woolliams—24.

(Quorum 10)

Timothy D. Ray,
Clerk of The Committee.

MINUTES OF PROCEEDINGS

TUESDAY, October 25, 1966.

(15)

The Standing Committee on Justice and Legal Affairs met this day at 11.20 a.m., the Chairman, Mr. Cameron, presided.

Members present: Messrs. Aiken, Cameron (*High Park*), Chrétien, Forest, Joyer, Guay, Honey, MacEwan, Mather, McQuaid, Tolmie, Trudeau (12).

Also in attendance: Mr. Noble, M.P.

In attendance: Mr. Robert E. Malkin of Vancouver; and Mr. J. Douglas Tracy of Little Current, Ontario.

The Chairman introduced Mr. Robert Malkin of Vancouver, who read a statement re Bill C-87.

On motion of Mr. Tolmie, seconded by Mr. Honey,

Resolved,—That documents from the Department of California Highway Patrol (*The Roles of Carbon Monoxide, Alcohol and Drugs in Fatal Single Car Accidents*, and *Alcohol, Drug, and Organic Factor Study*); and an *alcotest*, both submitted by Mr. Malkin, be made exhibits (*see Exhibits 10, and 11 respectively*).

The Committee then proceeded to the questioning of Mr. Malkin.

The Chairman introduced Mr. J. Douglas Tracy who made a brief statement, followed by which the Chairman thanked Mr. Malkin and Mr. Tracy for their great interest in the Committee proceedings.

At 1.10 p.m., the Committee adjourned to Thursday, October 27, 1966 or to the call of the Chair.

Timothy D. Ray,
Clerk of The Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, October 25, 1966.

The CHAIRMAN: Gentlemen, we have a quorum. It is my privilege and pleasure to introduce to you Mr. Robert E. Malkin of Vancouver who has established for himself a continent-wide reputation in the crusade for safer driving.

I told Mr. Malkin that I had read his brief and I thought it was a better introduction than any I could make on his behalf. So, without any further words of mine, Mr. Malkin, we welcome you to this committee. We will be pleased to listen to you and, after you are through, I hope that you will allow the members to address questions to you.

Mr. ROBERT E. MALKIN, Vancouver, B.C.: Thank you, sir.

(Translation)

Mr. Chairman, I am sorry, I do not speak French. I come from Vancouver.

(English)

Mr. Chairman, ladies and gentlemen. If my son were here today I would not be wasting your time on this pyrrhic war. I have done the best I could, in every way possible, to get publicity—and I hate publicity. I have had coloured photographs placed in national papers; there has been an article in *Maclean's*; the *Rotarian* has an article this month in every English-speaking country in the world; several American newspapers including *Parade* which has a circulation of 10 million, have had articles, and there are some 500 press clippings having to do with the subject matter, mostly concerning my campaign. This is what I have done or endeavoured to do to influence public opinion.

You know, I really should shorten this presentation. However, because this may invite confusion and resultant disaster, I will begin at the beginning.

I quote from an editorial from the *Vancouver Daily Province*, not because it concerns me but because it concerns public opinion. This article is dated March 4, 1964:-

"Nothing can bring their son back to life but Mr. and Mrs. Malkin plan to arouse public opinion in California to demand tougher penalties for drinking drivers.

"They intend to seek signatures for a petition to be placed before California Governor Pat Brown.

"If Mr. and Mrs. Malkin are able to arouse California to a crusade against drunken driving, their memorial to their son will be a selfless and enduring one.

"It will also be an example of what can be achieved by men and women who REFUSE to endure passively that which they know demands a

remedy. There is in the grief and determination of these parents a lesson for every one of us."

Gentlemen, it is now 1966, and an answer has been found in California. I feel that we served as catalysts to change the law, to right a wrong.

I quote an editorial from the San Francisco *Examiner*, a Hearst newspaper April 11, 1965:—

"Drunk drivers are the No. 1 killers on California highways. Existing laws fail to cope with them. Indeed the leniency of these laws, and the loopholes in them contribute to the indifference of the chronic, repeat, drunk driver.

"One of every 3 persons killed or injured on California highways in 1964 was the victim of drunk driving. 40,000 accidents were traced to drunk drivers.

"These bills are firm but not harsh. They would not stop all drunk driving. But they would greatly strengthen the hands of law enforcement agencies in reducing it. They should be adopted."

I would like to add that the National Safety Council say that just over half of all auto fatalities (52 per cent) involve liquor. Note, I did not say drunken driving; I said involved liquor. But of this amount, two-thirds are drunk, i.e. about 34 per cent of all fatalities can be charged to our tolerance of drinking and driving.

I give you the only copy of a recent and very good report from California showing that 228 out of 325 of male SINGLE CAR FATALITIES—now this is a special type—involved drivers with .10 per cent or more alcohol. This is known because of the Coroner's report which is, of course, a public document.

I would like to submit this, Mr. Chairman, for your information. It is very well broken down into ages, districts, males, females and so on. You could also get more from Commissioner Crittenden.

On June 20, 1966, the U.S. Supreme Court ruled in the Schmerber Case that "Police taking blood from an objecting motorist suspected of drunk driving does not violate the Federal Constitution" and that "Blood Tests" are reasonable and highly effective in determining the degree of influence of alcohol." My authority is *Time* magazine, and news clippings were sent to me by Governor Brown's office.

President Johnston was quoted in the press earlier this Summer as saying that next to Viet Nam, driving safety is number one on his Federal program. Since just over 50 per cent of auto fatalities concern liquor in various quantities, I think then that we can assume it is of the utmost importance. I admit I am using an American situation here, but I would like to draw another parallel. It also came out in the press this summer that 5,000 fine American boys had been killed in the last two years in Viet Nam; but, what that article did not say was that in the past two years 100,000 people have been killed on American highways—and it is about 10 per cent in Canada extra—and of this 100,000 50,000 involved liquor. My reaction as a father was exactly the same as yours would have been under similar circumstances. Perhaps some of you have already experienced this—if not, I pray you never will. There was a sense of overwhelming loss; a stunned disbelief in the truth that your mind cannot

cept or reject; an end to dreams that you did not know existed until they ended—abruptly ended!

There was a second reaction, and this was my knowledge that this waste of life need never have happened, and that, as a man, I owed a DUTY to myself and to the society in which I live, to do everything within my power to put a stop to it. But what can one man do in this North America of ours in the face of lobbies. This does not apply in Canada so much but, in the United States especially, there are lobbies against compulsory insurance, lobbies against the use of drunkometers or breathalyzers, lobbies against fixed blood alcohol definition, lobbies against mechanical standards or motor vehicle inspections and lobbies against almost anything that is objective by way of control, and perhaps, worst of all, lobbies presented by some members of the bar against anything that might question a man's right to drive drunk, insane, blind or otherwise, which is in some strange way associated with civil liberties. This is true in Canada but, to make my position even more difficult, this incident occurred in the U.S.A., where an almost identical situation exists.

My turning point came one day early in 1964, when I attended a Rotary luncheon in Vancouver and heard Chief Justice Jack Wilson of the B.C. Supreme Court talk on "The Duty of the Citizen Toward the Law". My mind was made up. I felt that spending my time and money this way was a better contribution toward mankind than anything else that I could do in memory of my son, my only child.

I would like to pay tribute to the tremendous help I received as a result of my trusting the advice and confidence of the experts on law, safety, medicine, and last but not least, all those of the news media—and I will never forget this. I was completely ignorant. I knew nothing about publicity. I would like to add particularly that the Canadian Highway Safety Council are fighting very hard in this area, and as a director of the Vancouver Traffic and Safety Council, I have learned to appreciate this fully.

My motivation was not revenge. I was, of course, appalled by the light sentence considering the previous convictions (which were not brought up in court and which I will explain later) and I now began to realize that this was a VAR game.

In his first meeting with me, Governor Brown of California said, "Perhaps our son will not have died in vain." Well, Gentlemen, results have shown that he has not—the law is passed—and I take deep satisfaction in this.

If I now compare California with Canada please take into account that there are similarities; both have a population of roughly 20 millions. California although only 43 per cent of the size of the Province of British Columbia, nevertheless has 11 million vehicles on its highways. Canada has some 7 million only—actually less than 7 million. If we project this, it is reasonable to say that the traffic problems of Canada are perhaps one-third less than those of California at this time. But the auto people tell me that in Vancouver City for instance—and I expect it is the same all over—we can expect an increase of car registration of about 40 per cent by 1970, so by that time probably we in Canada will have the vehicle population that California now has.

The killing rate for 1964 in North America was 24 people per 100,000 population and California has the same national average. By comparison,

Nevada, where liquor and gambling are wide open, kills 48; Connecticut and Rhode Island, next to New York, which had a liquor age limit of 18, got into a mess years ago, tightened their laws and they kill 9 and 11 per 100,000 respectively.

But remember this, last Labour Day weekend in the United States 600 were killed in auto accidents. Now, if we had 10 per cent of the population maybe we should have killed 60, but the cold hard facts are we killed 100. If you take into consideration their car population per capita is higher than ours, we really killed double the number of people, and this whole situation is completely out of control.

If you assume that the figures which the National Safety Council have said are correct, that just over half all fatalities concern liquor, this is something we can do something about. Based on figures given to me by the National Safety Council, the 100 deaths this last Labour Day weekend represents an economic waste of \$17,500,000 in Canada, quite apart from heartbreak.

Let me read in part the message I carried to the California Senate April 20, 1965. I read this, ladies and gentlemen, because really nothing has changed. The situation there is very similar morally.

"I feel that the honor of being invited by your Governor to testify here tonight as your guest is a matter of much importance. First, let me explain why a Canadian came to your country last year to put on a public demonstration. I did so at the request of quite a number of citizens of your state who were themselves unable to do so and I did this entirely at my own expense.

Our two great countries have an almost non-existent border between us, and the peace between us for over 150 years is the envy of the world. Our drunk driving problem is not!

My son, Kit, and his friend John Barth, both graduate students working as Teaching Assistants at Stanford University were returning from the laboratory at Stanford one midnight, when they were killed by a driver who had been drinking heavily for many hours—10 hours.

The offender drove through a red light in a 25 mile zone in Palo Alto at 50 miles per hour—by his own admission. He hit Kit's car broadside or pushing it 50 feet, and then going another 100 feet onto a boulevard where he knocked down a tree.

Curiously enough this boulevard was outside the claims office of the All State Insurance Company where there are 50 people employed. You can judge how they felt about this. This was the second tree to be knocked down on this boulevard.

He then left the scene of the accident and was arrested two hours later due to the courageous efforts of four observant teenagers. The force of this accident broke one of the seat belts.

Here it is. I had it broken later. It broke with 2,050 pounds.

A group of parents who had also suffered similar agonies through the death of their children, formed a committee to call sharp attention to this problem. It was for them—as well as for my son—that I made my pilgrimage through your beautiful state. I tried to carry this emotional

subject to your people effectively and in good taste. I hope, therefore, that this short presentation will be received by you in the same spirit in which it is offered, one of co-operation by you in a hands-across-the-border effort against a common enemy, the CHRONIC DRUNK DRIVER.

Let me give one statistic quickly: the drunk driver kills one person every *thirty-three* minutes in America and Canada collectively.

Now, I just said one in every 20 minutes. I was referring to drinking drivers. This is drunken drivers and there is a difference.

The drunken driver plays no favourites, be his victim in a chauffeur-driven limousine or a Model T Ford.

What happened to my son is not important, except to me. I just don't want it to happen again.

I did not come down to California as a foreigner, saying that your laws were wrong. What I did say and I said it very often was THIS: "This is the law; is it right, is it wrong?" I merely tried to make people *think*.

Under your laws (and Canada's are the same), only a fool would voluntarily take a blood/alcohol test if he had been drinking and driving. I wouldn't.

The Canadian Bar Association (working with the Canadian Medical Association) in March, 1965, recommended to the Minister of Justice that an alcohol level of .08% be enacted into law, and that failure to take a test upon the request of a police officer who has reasonable and probably grounds for believing a person is intoxicated while in charge of a motor vehicle, will result in 6 months suspension of his driving privileges. I feel that the Canadian Bar deserves great credit for the progressive stand which its Executive Committee on Crime has recommended and which has apparently been approved by a majority.

I have never asked for stiffer penalties in law. The courts in your state and my country do not use the maximums they already have. All I have ever asked for is a deterrent to the chronic drunk driver. When the 21 year old man killed my son and his friend (and this was his 12th conviction for drinking or driving misdemeanors) I wondered if there was ENOUGH deterrent to prevent a repetition.

No one is more conscious of civil liberties than I am. If America and Canada set up a limit in law of driving speed which is unfair to some but fair to the majority then, gentlemen, I submit, why should we not set up in law a blood alcohol limit that may be unfair to the habitual drinker who is still drunk at 8 o'clock in the morning but is fair to the majority of the community?

I would like to tell you this. On my committee down in California there were two sets of parents whose daughters were killed between 8:30 and 9 o'clock in the morning on the Bayshore freeway by drunken drivers who had not had a drink that morning since getting out of bed but they were still plastered and went right through the median and hit them head on.

Under the laws of your state and of my country, civil liberties should be equal for everybody. But the liberties of the chronic drunk

driver are more than equal. If a drunk driver kills someone, he can refuse to take a chemical test for alcohol—but his victim cannot. His victim goes to the morgue. Just what is voluntary about the Coroner's report on the alcohol that may be in *his* blood? Is that equal rights?

Just supposing my son had been drinking. Believe me, ladies and gentlemen, that accident happened at midnight on Saturday night and I had a doctor go there—the other parents had—and he said they sure searched those boys for alcohol. Of course, I would too. What would you expect on a Saturday night; especially when the others had liquor all over the place.

Sometimes I wonder just whose rights we are protecting! I have talked to many of your state and municipal traffic policemen, many of whom signed my petition, and they are frustrated by the laws of my country and your state slanted in favor of the chronic drunk driver.

I drink myself nearly every day; I drive a car nearly every day; but I use discretion and personal discipline. I am not against the man who has one, two or three drinks, enjoys his dinner and drives home.

I have here a small bottle purporting to be whiskey. For a person of my weight of 200 pounds this represents .10% alcohol roughly. Ladies and Gentlemen, if I drink this now, would you drive with me in half an hour or in an hour—because in about this time this would represent the bare minimum of alcohol in my blood stream to convict me under .10. Would you insure my car knowing I were in the habit of doing this?

And then I pointed to a couple of senators. I said:

Senator Christensen, as a former Superior Court Judge, would you judge me on this? Senator Petersen, as a former District Attorney, would you prosecute me on this? Would any of you gentlemen, as practising attorneys—and they all were—care to defend me if I had an accident?

Many of you—and this applies to all of us in this room—have relatives and friends who drive the roads of this great state daily. May God forbid that they should meet someone with **THIS MUCH** alcohol in them on a busy street.

From Vancouver, B.C. a Mr. & Mrs. Loftus were both killed in 1959 on the Bayshore Freeway near San Francisco. One son recovered, but the other, then age 7, became an incurable idiot. For four years—it was then four years; it is now longer—this boy has had to wear diapers and use suppositories daily. He was unable to walk, to chew his food, to feed himself. He is at present in Woodlands School outside of Vancouver and will remain there forever. Fortunately, he doesn't know anything and his parents are dead.

In Oakland a young man asked to sign my petition saying that his mother had been killed by a drunk driver two days before and he was on his way to the hospital to visit his father who had been injured in the same accident.

A Lakewood, California, couple came up to me one day. Their 15 year old daughter was killed in 1963. They had collected personally, with no help, 2,800 signatures, a stupendous job.

Ladies and gentlemen, there they are. They go right up and down the street, street after street after street. I got these facts from Governor Brown. My file was this high. This is a fantastic effort on the part of these three parents. People have had enough.

A Long Beach woman approached me with tears in her eyes and her face bearing the angry, purple scars right down one side because of a recent accident. She said her husband was killed and she and her two children were injured badly in an accident caused by a drunk driver.

On Market Street at 5th in San Francisco, another woman came up to me and said, "My husband is a terrible drinker and if this petition will help get him off the road, I'll SURE sign."

Gentlemen, I have here nearly 20,000 signatures, as a symbol from many people, 75 per cent of whom said they had friends or relatives hurt or killed by the drunken driver. They told me to tell you when I went to Sacramento, "We have had enough of the chronic drunk driver, and in the name of justice, please do something soon."

May you think deeply and clearly, with understanding hearts, and search your conscience for what is right and reasonable when you vote on these bills"

This ended my testimony.

The vote was eight to two in favour. It was quarter to twelve midnight when I spoke. Present were seven reporters, two T.V. cameras, with 500 people in the audience. Later, through a form of political gymnastics the bills were defeated in 1965 on a voice vote; but on June 21 this year they passed 23 to 12 on a standing roll call vote.

Even Napa County where the wine comes from, the representative in the Assembly, Mr. Young sponsored the Senate bill on this subject matter. I give you in evidence a few copies of Senate Bill No. 3 for 1966. Very roughly, this gives compulsory tests. Refusal means loss of licence for a period of time and it defines drunkenness and impairedness. I quote an editorial from the Vancouver Sun, March 6, 1965.

ROBERT MALKIN'S CRUSADE

One-man crusades usually are more noteworthy for their curiosity than for their impact. The term itself suggests the fanatical crackpot. Besides, any issue worth fighting for is bound to be the serious concern of not one man but many. But Vancouver's Robert Malkin is no crackpot, and he is far from alone in his campaign against drinking drivers. His plea for scientific tests of impairment, for example, has wide support, ranging from Highways Minister Gaglardi to the Canadian Association of Police Chiefs.

By the happenstance of personal tragedy, Mr. Malkin for 16 months has waged war against the murderous highway drunk with a singleness of purpose which sets him apart from most other highway safety reformers. So that the death of his son in a California car crash might not be in vain, Mr. Malkin has gone to unusual lengths to protect the people of both the U.S. and Canada from similar fate.

If I might, Mr. Chairman, I would like to pass these around, for visual examination, if that is not going too far?

The CHAIRMAN: No, no.

Mr. MALKIN: I continue:

He has trucked his son's wrecked car around California on public display. He has lobbied the federal government.

Actually, I came here in 1964 and saw the Prime Minister and the Minister of Justice.

This week he carried his campaign before the annual meeting of the B.C. Automobile Association. Soon, he will appear before a committee of the California Senate. What will come of Mr. Malkin's efforts remains to be seen. But if scientific impairment tests ever are adopted in Canada and in California, which is a very controversial place, and the deadly drinking-driving combination minimized, it could well be because Robert Malkin, with his dramatic message, caused many men to think.

Please let me quote some medical authorities: Dr. Charles Hine, noted American Toxologist of San Francisco University, who flew to Sacramento to testify with me, noted:

There is an extremely dangerous point where people have a very low alcoholic content of between .04 to .05 per cent—more or less halfway through the second drink is my interpretation of it—and are completely carefree and irresponsible.

I can only compare it to the word "kittinish"; Katzenjammer would be the German word. I cannot think of any other word of describing it but it is crazy.

Later they may or may not become cautious although they have more alcohol; the caution seems to be set in as a subconscious protective device which nature gives us.

I quote Dr. Barney Moscovich, Medical Director of the Alcoholic Foundation of B.C. who reminds us that:

Alcohol seems to give many drunks a kind of *tunnel vision*—like looking down a pair of binoculars—that is seemingly good so far as it goes. A man might be so drunk he can hardly find his keys; in a car, he can drive in a straight line. But, and there is a big but, this tunnel vision has, under this condition, destroyed his peripheral vision so that if anything at all happens to one side, he misses it entirely.

But this is how drunks get home; they are lucky. Dr. Moscovich also feels that the answer is a continuing education of the public, and I agree with him. This will have to be a well planned program so that people will not become enured to it. There must always be something new, a gimmick if you like.

I put my son's car on a truck. That was a gimmick. I don't believe in wrecked car parades. But as long as I was there, this was a gimmick; it made people think.

Two years ago, I bought a postage meter slug for \$11.99 which I persuaded the Postmaster General to use on various machines in Vancouver, Ottawa,

Toronto, Montreal, and so on. It read, "IF YOU DRINK DON'T DRIVE": "SI VOUS BUVEZ NE CONDUISEZ PAS". These electric metering machines handle roughly one million pieces per month—but these ideas must have a continuing originality to be effective.

I quote Dr. Frank Turnbull, in 1965 President of the Canadian Medical Association, who wrote me:

"I think that what you are doing is one of the most important projects for public good in Canada at the present time. I just wish we could provide you with a pictorial description of the neurosurgical ward around Christmas, showing the frightful assortment of badly injured people whose accidents were the direct result of drunk-driving."

In February, 1964—my son was killed November, 1963—the California judge asked by phone through the Vancouver *Sun* for our opinion, as bereaved parents, as to punishment. He wanted us to write a letter to him. This was unheard of, but there it was.

To be fair, we interviewed our senior British Columbia probation officers, assuming the letter might be made public. We wrote the judge that we felt that a sentence of 3-5 years might be reasonable, but that the offender's permit to drive should be suspended for as long as the law allowed. RESULT: The offender got one year in the local county jail farm on each manslaughter charge, concurrent, a net time in jail of 8 months and 2 days, and this was his twelfth conviction at age 21. His right to drive was not suspended, until I went to see the Director of Motor Vehicles in Sacramento, who granted my request immediately until the young man could prove financial responsibility. But since, Tom Bright, the Director also told me that California has one million drivers on the road today without licences, it is questionable whether loss of licence was a deterrent.

When I made my first visit to California, I found an unexpected development taking place. The needless slaughter of these particular two boys had stirred a movement of protest in the Stanford University community. Out of the hundreds of fatalities each year in this Bayshore area around San Francisco, these two deaths had triggered a positive reaction. Some of their friends and I joined them, had started to form an organization called, "ACTION FOR RESPONSIBLE DRIVING."

Other things happened and for those of the press who are here, this is the one paragraph I do not want released for obvious reasons.

One of the Marine Biologists working with the two young men in the same laboratory was so horrified, that she drew up a simple one-page petition which I used to Governor Brown to: "do something to strengthen the present laws to deter the drunken driver".

That's all the petition was. Do something.

I used this petition. This young lady was a nun, Sister Mary Aquinas Nimitz, daughter of Admiral Nimitz, and she worked with us until her order asked her to withdraw.

After the sentence, I went to see the Superior Court judge. I asked him, if, since he had the power to give a sentence of 10 years in San Quentin, if he considered that the net time of 8 months and 2 days was sufficient to deter this offender who had already 11 PREVIOUS convictions. It was then that I discovered

the judge had not been informed of the past drinking or driving record. Some of you know there is certain thinking in law that past records should not come up in the present case. I won't give you his very sympathetic reply. Months later, on a Traffic Sentence Day, I solicited signatures in front of his courthouse and the judge came out to look at the wreck. Walking away and shaking his head he said, "Mr. Malkin, having seen this wreck, I wouldn't blame you for ANY action that you would take." And he continued to shake his head and walk away.

Gentlemen, I am sure that this judge and many others in California have raised their sights on sentences.

A Municipal court judge in Santa Monica, W. Blair Gibbens, famous for sentencing President Kennedy's sister, Mrs. Peter Lawford, to writing reports in a hospital accident ward, asked me to park in front of his court room on sentence day. I did. He had the Marshall clear the court of 100 people, a huge place, who came out and many signed my petition.

Then he invited me, together with the press and TV cameras into his court. He took his robes off and asked me to give a 10 minute speech on safety and moderation. While such behaviour is somewhat untoward in our courts, I can assure you that the vast majority of people there benefited. When I stopped talking they stamped their feet and clapped their hands for about three minutes.

Police throughout have been most courteous, most courteous. In San Francisco, I was allowed to park on Market Street in the NO 4 to 6 ZONE during the traffic rush. I could park on a one-way street facing the wrong way. The sky was the limit. Those who see what devastation is caused by the drunk driver realize that something must be done.

You, ladies and gentlemen, are sophisticated and know that under Sec 224(4) of the Criminal Code of Canada, refusal to take a test cannot be mentioned in court. But what about the less sophisticated? What about the poor slob? Surely the present halfway measures should be amended and the test made either compulsory or unavailable to ALL. Let's even it up.

Drunk drivers are in the great minority, but the findings of the International Association of Chiefs of Police confirm that they are deadly. Shouldn't the 20 million in Canada be protected from them; after all they kill about 200 people per month in Canada. Keeping the drunks off the road is a protection of OUR rights. Does a man have "Rights" when he is drinking and driving or is this simply an abuse of privilege, a rejection of responsibility?

For those who object to the compulsory test, let us look at the law in the U.K. Under the Road Traffic Act, 1962, 10 & 11 Elizabeth 2, Chapter 59(2)—I am sorry I do not have a copy, but I know there are many here in Ottawa—the refusal of an alleged offender to take a test may be mentioned in court as evidence on a charge of unfitness to drive. Under Sec 224(4) in Canada, it may not.

I can tell you that the liquor industry are concerned that the public might turn against them if some curbs are not established. The Vice-President of the House of Seagram sent me many ads indicating the amount of money spent on *moderation* in this respect. One of the strong points in my campaign was that I said 100 times on radio and TV that I was not an abstainer and I

did not attack the industry. If I had, of course, opposing forces would have swamped me in California. Actually, I did hurt part of the industry but I am sure that this group was responsible for our defeat in 1965 in a voice vote in California. The small bar owners were hurt. You see, California does not have public transportation. The auto and the airplane are public transportation. So, by driving people out of their cars where a bar can only be approached either on foot or by private car, I drove them into their homes—and this is what this law will do to a degree—and the bars lost business. I cannot help this. What I am asking for is simply a law to deter the drunken driver. Both automobiles and alcohol are here to stay and people must learn that moderation is the factor in safe driving. It is a question of a law that is good for the vast majority. I quote one last editorial from the San Francisco Examiner, February 20, 1966.

“Governor Brown has been as good as his word, by including an “implied consent” anti-drunk driving bill in his special session call. This was the protective legislation the Senate treated so cavalierly in the last session in the face of strong demonstration of the public’s needs and wishes. The implied consent concept is that issuance of a driver’s licence would carry the condition that the motorist “shall be deemed to have given his consent” to a chemical sobriety blood test.

That is what we have in Saskatchewan.

A companion bill last year would have established an alcoholic blood content of .10 per cent for legal presumption of intoxication definition.

Both bills were by Senator Randolph Collier of Yreka.

This is the man I backed.

We hoped and predicted they would be back again. Now they are, with the Governor’s approval. We hope they pass. If they don’t, we will expect them back *again and again until they do*. We take this position because drunk driving annually kills far too many Californians. The implied consent provision is in the laws of many states. It has been repeatedly upheld in the courts. The chemical blood test is objectionable because of supposed invasion of privacy and personal privilege. Actually it is a scientific means of determining the fact and degree of drunkenness—an essential deterrent to drunk driving. Who would argue that drunk drivers can safely or sensibly be allowed on California highways? Why should the legislature hold back from a measure for which there is such **CLEAR PUBLIC NEED?**”

Ladies and gentlemen, the same applies right here in Canada.

Speaking of rights, because I am very conscious of this, the word “RIGHT” is open to many interpretations. We must take a driving test to get a licence; we must take an eye test before the driving test. In many places we must take a blood test to get a marriage licence; California is one. Nobody asks us to drive a car; nobody asks us to get married—you can live in sin. Yet all of these restrictions are a certain loss of rights, but we accept them. Many other personal privileges have been curbed in the interest of law and order without an outcry because they are for the good of the vast majority. Then I submit,

why should we not establish a law, a blood alcohol factor that is fair to the majority?

I have read in the Canadian press that some lawyers and citizens feel that the police might abuse a compulsory test law. Such comments are studies in contradiction; if the police can abuse the enforcement of one law, they can abuse all of them. Does such specious argument propose that we eliminate all legislative traffic controls in order to protect ourselves from the police whom we employ to protect us? I certainly do not want a police state, but I still feel that the greatest deterrent to the drunken driver is the man with the badge. Why not give him the tools to deter? We honour his uniform; we take his gun away. We should not depend on our insurance companies to wield a bull whip through higher insurance rates. As it is now, the guilty driver suffers most as an accident repeater by increased premium fees, and this is in fact the ONLY sure and consistent penalty that exists.

As I said, in 1965 we were unsuccessful in California, but the Senate did do something. Commissioner Crittenden, a staunch supporter had, at the time, only 2500 traffic police in his California State Highway Patrol for 11 million vehicles. The future is showing up for all of us, you know. Recent drinking-driving statistics released, which I have given you, Mr. Chairman, are so startling that this force will be more than doubled in strength to 6,000. The plan for financing is simple. By 1968, the vehicle licence plates will be raised a total of \$3 per year per set, which will raise \$35 million, but enough for another 3500 men and equipment. This is a deterrent—and this is outside the cities, mind you. On the other hand, in Vancouver City, during the last 10 years, we have reduced our traffic patrolmen by 20%, and the result is our death rate in 10 years up is 40%.

The country looks to the Bar to give support to the law. I think that the Canadian Bar Association's Committee on Crime is to be congratulated for the strong stand taken in 1965. But I feel that somehow its general membership might be said to have lost touch and forgotten—and I have been told this by the hundreds of thousands of people I have talked to—how much the man in the street depends on it to carry out its trust as officers of the court. The Canadian Bar Association is our watchdog.

Some lawyers at the 1965 Bar meeting in Toronto were quoted in the press as saying that in their opinion loss of licence is a sufficient deterrent. I disagree, at least where B.C. is concerned. In B.C. it is easier to get a driver's licence than it is to get a card for the Vancouver Public Library where I am required to give the name of three sponsors. But in British Columbia, if you look to be over 21, not one scrap of identification is required. I told our Attorney General, Hon. Robert Bonner—who I saw at breakfast this morning—last month, that I could have another licence in 15 minutes. I would have to perjure myself but, I would change my name from Malkin to Molkin and I would change my birth date by one day. I could leave the same address and never be caught. Perhaps we should do as California and have at least a passport photo attached. This can hardly be regarded as a loss of liberty.

We must have a fixed definition for impairment. There is no excuse for not doing so. Let me quote Coroner Glen McDonald of Vancouver, a past president

of the Coroners Association of America and a member of the bar, in a recent article:

"He was unsteady on his feet," the arresting officer testified. "Well, your worship, I pulled a tendon when I tripped over our cat on the way to the car." Case dismissed.

"He smelled of alcohol," said the officer. "It wasn't alcohol. You see, I have a loose denture and I'd been eating blue cheese in the press gallery." Case dismissed.

"His eyes were blurred." "I'm a non-smoker and I sat through two shows at a night club between cigar smokers." Case dismissed.

"He failed to pick coins up off the floor." "It wasn't my money your worship." Case dismissed.

Ladies and gentlemen, why, in an age where crime detection has substituted the comparison microscope and chemical analyses for the rack and the thumbscrew, are we attempting to resolve the alcohol-transport conflict by such primitive means? The conflict is hardly new—only the scientific means of resolving it.

When Noah's grapes fermented into wine which was consumed by the captain of the ark, there was no breathalyzer with which to evaluate the hazard. Some had no alcometer to test its tiddly charioteers and the pony express people were without a drunkometer to curb the odd rider who bit the dust after nothing more lethal than a few shots of snake bite remedy. But now we have these instruments and with the super-highways and the high speed automobile, the carnage is becoming intolerable.

Society is not, however, prepared to pay the price for absolute highway safety, which would require criminal proceedings against any drivers with the slightest traces of alcohol in their systems, such as is so in some European countries. We are prepared to tolerate some alcohol-induced decrement in driving skill. Driving skill can't be scientifically measured, but the blood-alcohol factor as an *indicator* of driving skill can be scientifically measured, and measured very accurately indeed.

Such instruments as those already mentioned are probably more accurate than the gasoline pump gauge, police radar and time-distance traps, and certainly more accurate than the weary police officer giving his ritualistic recounting of the "facts" from the witness stand.

But on and on it goes, the blindfolded lady of justice trying to serve a public which is prepared to accept as justice a magistrate's guess tinged with the milk of human kindness or a game of wits (a shell game of delusion and deceit) between the prosecutor and defence counsel. But science offers no guess and no kindness and it doesn't play games. It says, "this driver had a blood-alcohol factor of X per cent; do with it as you will."

A new law has been passed late this spring in British Columbia which will be effective this fall. I checked this this morning with the Attorney General. To quote the Attorney General, Mr. Bonner, "Its purpose is to get the drunks off the road". It is a unique approach made by him, to an unpopular and controversial subject. This subject is really a Federal problem—that is why I am here—but this is the law to be: If a policeman suspects a driver of having

alcohol in his system, he may take away his licence on the spot if the driver refuses to take a blood-alcohol test at the scene when requested. This licence is taken away for a period not exceeding 24 hours, but may be returned almost immediately. The approach is one of *prevention, not punishment*. It is a very delicate one.

The B.C. Government is now looking into the question of a small instrument about to be used in the U.K. I submit here, Mr. Chairman the alco test. Now, this is one of many. It is like fish hooks; they are made all over the place. This one happens to be made in Germany. They are also made in California and Japan, to my knowledge. This is roughly what happens. This is not admissible as evidence into court but I suggest that it may be a crutch for the policeman.

Here is a little glass tube with some chemicals inside. It is sealed. You have to break off the two ends and you insert one end into this balloon. You take a nipple which is hermetically sealed and you jam it on the other side and get the drunk to blow into this. Now, this is of a certain size, it isn't a balloon—it just blows up that big. The idea is to measure quantity because if it was twice that big it would throw this all out of kilter.

Now, the officer, say, in this British Columbia case has an alleged suspected drunk offender; if he can get him to blow into this, this will show (a) this man is drunk or (b) this man is sober—and there is a small place in between where he is marginal. It will not hold weight in court but it takes the policeman off the hook for being judge and jury, which I feel very strongly about. I think this is a good thing.

The British government—I was there again in June and I spent two hours with the Under-Secretary of the home office and another two with the Department of Transport—showed me this. I submit this, Mr. Chairman, as an idea. It does not hold water in court, and I want this clearly understood; nor am I sponsoring this as an individual item, because they are made all over the place. But, it may be a very good thing for the police officer who is not sure of himself. The important advantage is it relieves the policeman of being judge and jury; the instrument tells the officer whether or not a proper test is warranted.

Let me quote from the 1960 report of the Criminal Law Section sent to me in 1964 by the then Minister of Justice, Guy Favreau, "The Commissioners had considered the general question in 1955, 1957 and 1958 and were then of the view that the time had not yet arrived for the enactment of a standard test for intoxication. Their views having remained unchanged, the Commissioner's recommend no action".

On October 1, 1964, I talked to senior civil servants on the deputy minister level in Ottawa. They told me frankly they did not think Canada would enact legislation on definition of the amount of alcohol, nor a compulsory test. If this is the attitude of these senior officials, the Minister of Justice can do little about it, but I do hope you gentlemen will. *The climate of public thinking has now changed.*

The Hon. Guy Favreau, as Minister of Justice went on a national hook-up of TV with me in 1964 to damn the drunken driver. He told me his own son then 17, was hit but not hurt by a drunk in 1963.

I have here my only copy of the new road safety law (U. K.)—not to be confused with the road traffic act I mentioned earlier—printed August 10, 1966

together with a synopsis—by Mr. G. Baker, the Under Secretary of the Home Office on Horsebury Road, London which I submit, Mr. Chairman.

I hope that the British approach, which is very good, will be taken into account by this Committee. It is the work of many years in a country which has the most moderate approach to the alcohol-transport problem. I wish to draw to your attention the *blood-alcohol limit* of .08% here. This bill is designed to give the driver the incentive to not drink and drive; it gives him the incentive to pull off the road and stop driving if he realizes he ought not to be driving. This attitude is most important.

I will not go into any detail of the limits of other European countries, as I believe you are already well-informed on this. It is to the point, however, that in Germany, a driver may lose his permit to drive for life under special circumstances on the first offence.

What must we have in law? First, simply define intoxication. How can a man be convicted fairly if there is no definition? In fact *definition* may clear a man who has had a drink, but as a result of injuries appears to be under the influence. And if, as some claim, it is unfair to a few heavy drinkers, racing drivers and the like, let it be. Laws are made for people, not individuals. What about the unfairness of the speed limit laws to the racing drivers such as Stirling Moss, or even our highways minister from British Columbia, Mr. Lagliardi, but fair to the vast majority.

Under Sec. 224(4), refusal may not be mentioned. The result is, in many cases, where a charge of drunkenness might be difficult to prove, our police simply choose an alternate charge to ensure that the offender will suffer for his offence. This is why so many of the present figures on drunk and impaired driving are much lower than the facts, the police just don't bother and I don't blame these frustrated men a bit.

The law covering drunken driving must not be a Draconic or cruel law. I do not want a pyrrhic victory. I want a law that is fair and reasonable, to protect the rights of the rest of the citizens of Canada, a law that will be looked up to by other countries who will say, "Well, Canada may have been the last of the large nations to act, but she did a good job." We have a good many precedents, you know.

I know that in its way my effort has encouraged the police, medical, legal and safety people to feel that they are not alone; it has also caused some judges and magistrates, particularly in California, to raise their sights on sentences.

It has certainly caused many people to be more careful; others to leave that most lethal tranquilizer before they drive and arrive safely. I have many friends in Vancouver now who used to drive home. Now, they take a taxi. A taxi fare of \$2.50 is cheap.

In closing, I would like to quote from an article I wrote for the English language edition of the *Rotarian* International of October, 1966, which was done a year ago:

"We can stiffen our laws and everyone must do his part. It is up to you; either we are going to rule our roads with common sense or the drunks will do it for us—without common sense. Take your choice, if you think there is one."

I ask but for two items: (1) Definition, (2) A compulsory test—and that is all.

During my presentation, 3 people have been killed in North America in auto accidents where liquor is involved.

I have a short demonstration here which will shock you—it shocked me. I suspected that this would happen. I have been saying, as I said in California, “With this much liquor”—and this would be .10. So I went to the Vancouver police station and in front of the city analyst and three technicians and just so we would not have any problem I had a Negro, a Japanese and two Occidentals—I took six ounces out of this mickey, which is 12 ounces as you know, so half of it is there. I took the six ounces into the police station and I mixed it with 12 ounces of water. This is a strong drink, but it is not all that strong. It is, however, stronger than ordinary drinks, because I didn’t have all that much time. I mixed it—alcohol is an instantaneous mix as many of you know—and I started my first test.

Now, these two tests were done on different days but I had the same lunch; it was the same day of the week; I had the same degree of tiredness; I had the same time between what I had eaten and I had the same breakfast, so it was as close as I as a layman could make it. I had six ounces of rye and 12 ounces of water, which made 18 ounces. That gave me three six-ounce glasses, which I drank. The first I drank in ten minutes; the second in ten minutes and the third in ten minutes. Under breathalyzer rules you must wait 15 minutes from your last drink. You may not smoke; you may not touch any liquor; you may not gargle any Listerine; you may not have a glass of water—nothing. I waited and after 15 minutes I took a breathalyzer test and my test showed .095. I waited another 15 minutes which made 30 minutes and my test showed .09 per cent. In 45 minutes I had dropped again to .08 in one hour it levelled off at .08, and from there it levelled off. From those three glasses—and I was stewed; 15 minutes, .095; 30 minutes, .09; 45 minutes, .08; one hour .08 and levelled off.

I went in on another day and I took the rest of the bottle, the other six ounces, and I quaffed it straight—no water, and I waited 15 minutes. In 15 minutes I was .03 per cent versus .095. This was taken with no water. Another 15 minutes, .03, .03, .03. An hour and a half after, at four thirty, .03. In both cases, because I have a curious mind, I took a blood alcohol test from the venous blood of my vein and it hurt. Those police needles are dull—and I have an answer to that too. The blood alcohol test confirmed the level of the breathalyzer in both cases. Just to be certain I was right I used two breathalyzer machines. Now, this shocked the heck out of me because if I were a drunk or an experienced drinker, I would not use a 26-ounce bottle because rattling around in a car it is hard to hide from a policeman. It might break and it is very hard to hold up; you might break your teeth on it. But a mickey is another story; it fits in my pocket. Now, I might well drink 12 ounces if I was an experienced drinker very quickly. Would you drive with me? Twelve ounces, under these circumstances, would only give me .06. The purpose of bringing this test to you is merely to say I know—and I have given a lot of thought to this—that the argument of .08 per cent is too low. But what about .06 in this case?

I have a letter from Dr. Ward Smith—I have not the letter here, and I apologize for it—who has testified before this committee, and he has said he has come across cases like this. This is not extraordinary. It might be my metabolism, but I am convinced that the majority of us in this room could carry out these two tests and have the same thing happen. I am convinced of this. I learned from the British Medical Association this summer that if you not only use a mixer of water, but if you use a fizzy mixture such as ginger ale or soda, it will enter your system faster still. I have not run a test on that because I have not enough in this test. I feel that we should have, above all, a forensic clinic—that is a medical legal clinic—on a federal basis with biochemical attributes. I think this is absolutely necessary.

Such a clinic with biochemical attributes would find out the one thing that really puzzles me and the one thing I have done a lot of soul-searching on, and that is why liquor affects you differently than it does me—or you, or you. I feel that a forensic clinic would do a tremendous amount. That is the end of my presentation, Mr. Chairman.

The CHAIRMAN: Thank you very much, Mr. Malkin.

Are there any questions members would like to ask Mr. Malkin at this stage?

Mr. HONEY: Mr. Chairman, I want to congratulate you, Mr. Malkin, on your brief. I think it is very impressive, perhaps one of the most impressive ones we have received from the standpoint of informality, and to indicate how action can be obtained when a citizen like yourself decides that he has a duty to the public.

I wonder whether you have gone any further into attempts to reconcile our experiments, which you have just indicated to us, with the evidence and the writings of some of the more professional people, if I can use that terminology, who have indicated to this committee and in their writings that the breathalyzer test and the blood alcohol test is almost infallible in determining the amount of alcohol in the blood, and some of the evidence which we have had before this committee indicates that this is an almost absolute test. But the experiments you have related to us indicate we would have to look at the previous evidence with a great deal of skepticism.

Mr. MALKIN: Mr. Chairman, may I answer that question. Dr. Ward Smith admits this can happen. Speaking of the breathalyzer, I am convinced it is quite accurate, but I remind you that no machine is infallible. I am sure one of us in this room is going to have his battery go dead and his car will not start within the next thirty days. I will say this about the breathalyzer. I have seen it fail; the magnet stuck—and I watched this happen. But, in such a case it errs in favour of the accused. I saw this happen. I can name the man it happened to. There were a great many people there. A second breathalyzer was brought in. This can happen. It does not happen very often but I assure you, and I am sure you can find this out, it errs in favour of the accused.

Getting back to this, the reason that this does not go into the blood stream is because the pylorus muscle in our stomach gets very irritated when you pour straight alcohol on it and it tightens up and then only a little bit comes out. I gave assurance in a letter which I can hand to you, Mr. Chairman, from Dr. Ward Smith, saying that this does occur. There is nothing wrong with the

breathalyzer because, you see, this was not only a breathalyzer test but this was a venous blood test out of the vein of my right arm.

Mr. HONEY: But in the two tests, sir, that you related to us—and most of us here have had some experience with alcohol—how were you feeling after.

Mr. MALKIN: Mr. Honey, I will tell you something; it is no fun drinking with four professional goons looking at you. I would say, contrary to what most of you think, it was about a saw-off as to which made me feel more intoxicated. But I honestly believe that once the first ten minutes was over, this test with the water made me feel less like driving a car.

Mr. HONEY: There was a relationship between the way you felt and the amount of alcohol in the blood as indicated by the tests?

Mr. MALKIN: Yes. I can only tell you that the tests are scientific and they do not lie. I mean these tests concurred with each other—that is, the blood alcohol and the breathalyzer. I did not have a urine test. I could have, but I was quite happy with these.

Mr. HONEY: Relatively speaking, you were in a better condition to drive after the straight rye than after the rye mixed with water.

Mr. MALKIN: It wore off faster.

Mr. HONEY: The tests were relatively accurate in the indication of your ability?

Mr. MALKIN: In this sense, yes. While I am on this, may I say I feel there is good and bad in all laws, and one thing I like about the California law is the accused has the choice of test: blood, breath or urine—a choice of weapons in this sense. Now, this is a double-edged sword. What are you going to do in some remote place where there is only the local constable?

Now, in England for many years they have only had a urine test and the sample is put into two bottles which are sealed. I went to Old Bailey one day when they forgot to seal it and you should have seen the difference in the commercial reading. One bit is given to the alleged offender and the other is kept in the hands of the police, but they are sealed. Sealed urine will keep in the same condition for a long, long time and it can be mailed to a commercial laboratory. What are you going to do? We must have this law fair to everybody. I think there should be an "out". I am sure that northern Ontario and Quebec are just as wild as northern British Columbia. You cannot—and do not let anyone kid you—have a breathalyzer kept in the back of a police car and the police dogs licking it or any other thing like this. This is a delicate machine and it must be handled according to the set list of instructions which must be obeyed. I do not feel that this machine should leave, but let the experts tell you. It is my opinion, and from what I have been told by police authorities, you should not horse around.

The CHAIRMAN: Mr. Mather.

Mr. MATHER: Mr. Chairman, I too was very impressed with Mr. Malkin's presentation, and I am sure all members here were impressed. As a sponsor of a bill which, if endorsed, would provide a basis for a mandatory test, I am interested particularly in what he says with regard to the American legal situation. Would you say, Mr. Malkin, with your knowledge of United States

reaction to compulsory tests for drinking drivers, that this type of legislation is gaining ground and becoming more established in the United States in one form or another?

Mr. MALKIN: Very much. Mind you, California is a most controversial place. There is a new religious group on every corner and there is somebody with a petition on every other corner. Do not forget that in the United States crime is a state, not a federal, problem, so every state has their crime laws. But it is gaining ground tremendously. I cannot give you, because it keeps changing, the exact number of states that have implied consent but I have a feeling it is now up to 38. Anyway, it is gaining ground tremendously and it is, believe me, only a matter of time because, with the economic cost of each death at \$175,000, which is \$35 million a month in Canada for accident fatalities where liquor is concerned, they do not let it go forever, civil liberties or not; it just takes a long time. To be quite frank, I was amazed to see this go through in California; the lobbying against me was fantastic. But, let me tell you, in my opinion the women put this over. After all, they bear the children. The women, I think, swung the vote on this. I may have been a catalyst to expose something. If I had been in California, it never would have gone over. I was a Canadian, a foreigner. I had a foreign licence plate, a British Columbia licence plate. I think his is going tremendously.

Mr. MATHER: Mr. Chairman, those of us who are particularly concerned about doing something about this problem in Canada should relate as quickly as we can to the ladies to see if we can gain further support in this.

Mr. MALKIN: I could not agree more, and I am dead serious about this.

The CHAIRMAN: Mr. Tolmie is next and then Mr. MacEwan.

Mr. TOLMIE: Mr. Chairman, Mr. Malkin made a strong point on page 16 of his brief that an increased number of traffic policemen would certainly curtail drunk driving and driving while one's ability is impaired. He also mentioned his plan where vehicle licence plates fees would be raised. In this case you mentioned \$3 per set.

Mr. MALKIN: Yes.

Mr. TOLMIE: You also mentioned that in Vancouver City, during the last 10 years, traffic policemen have been reduced by 20 per cent, and the result was that in 1966 there was a 40 per cent rise in the death rate. If you feel that this is such a strong and effective way to curtail this type of traffic death, have you considered making representations to our provincial governments along these lines?

Mr. MALKIN: Yes, and I already have to our British Columbia government. The rest of the provincial governments hardly know I exist although the attorneys general and the premiers are all going to get a copy of the briefs. But certainly I can tell you that in British Columbia the number of traffic policemen on the freeways and highways is being increased, because this is the only thing that has put fear as a deterrent. It is not the right comparison but, ever since my mother said to me, "Robert, if you take another cookie from the cookie jar, you get a licking", I understood this. But it is being done; it is being increased. It is only a matter of money, sir.

Mr. TOLMIE: You mentioned on page 17 certain examples where the accused got off, ostensibly, on very flimsy excuses. Now, it has been my experience in my particular area that it is just the opposite, that if a policeman gives evidence in court and states the man was unsteady on his feet, his speech was blurred, and so on it is almost an automatic conviction. There has been a recent situation where a magistrate has refused to convict an accused on the evidence of one policeman with regard to his impairment. I feel that this perhaps points out the situation that you were trying to explain, that the degree of convictions varies with the individual magistrate and hence there are inconsistent results based perhaps on the same facts and circumstances. Your position, as I understand it, is that this breathalyzer test or the blood test is an objective test and this will supplant the subjective judgment of the magistrates which could vary upon their own background experience.

Mr. MALKIN: That is exactly what I mean, Mr. Tolmie, the magistrate's guess and the milk of human kindness. Why should we not have a scientific test and then let the law take its course. But this is fair to the man who has had a good stiff drink—he reeks of it—and has had an accident that has impaired him, although it was not his fault. He had not enough liquor in his blood but if he had bad luck and got up against a stiff magistrate, he might have an unfortunate ruling. Does that answer it?

Mr. TOLMIE: Yes.

Mr. MACEWAN: Mr. Malkin, could you just give us a few more details on the actual bill or bills that were passed in California. I take it, from page 14, they were probably twofold: first, the implied consent to take the test and, secondly, a bill to establish the percentage of alcoholic content.

Mr. MALKIN: Yes. In California, it was watered down a bit. They made drunkenness .15. They increased it from .10 to .15 per cent or 150 milligrams, and they made impairedness at .10. I personally feel it is much easier to just have one level and let it go—get the garbage out of the way and make it simple.

Now, is to implied consent, you understand that this means that if you take out a licence you give your consent that you will take a test when requested by a policeman who has reasonable and probable grounds to suspect that you have alcohol of some quantity in your system. So, in effect, this means a compulsory test.

The alleged offender has 15 days to go before the board and fight this, but this is a terrible complication in law which I think they will have to wipe out because it will be impractical; it will clog the courts. I think it is much better if we keep it simple.

Mr. MACEWAN: I note on page 20 of your brief you stated that in the United Kingdom they set the blood alcohol limit at .08.

Mr. MALKIN: Right.

Mr. MACEWAN: You said before that you believe that instead of the two criteria setting the intoxication impairment there should be one only.

Mr. MALKIN: That is my feeling, yes.

Mr. MACEWAN: If this was done by way of amendment in this country, what do you think, in your opinion, should be the test set?

Mr. MALKIN: Well, I am a layman and I have always ducked this by saying I could not care less if they make it .25 per cent because the drunk cannot count. I am sure that the professionals in this business, the medical people and the legal people, will know at what level to set it. Britain has .08; some American states have .10; some have .08, and I think some have .15. My personal opinion is that it should be .08. Look at the rate it drained out of me; in half an hour I went down from .095 down to .08. It burned up. So, if the worse comes to the worse, it really comes down out of you there.

I am sorry I cannot be of more help to you; perhaps I should take a position and say it ought to be this. But, I feel that is up to you. You have the witnesses. If you said ".08 or .10; we do not know which", I would say to you, flip a coin. I hope I am not weakening the whole case and confusing you by saying this, but the cold hard facts are that if we have a limit in law it will deter the drunken driver. This is all I have ever been after.

Mr. MACEWAN: Would you say, Mr. Malkin, in summing up, that first we want a definition set and some compulsory test?

Mr. MALKIN: That is right.

Mr. MACEWAN: Thank you.

Mr. MALKIN: Thank you, Mr. MacEwan.

Mr. NOBLE: Mr. Chairman, I am wondering if Mr. Malkin could tell us what a modern, efficient breath testing machine would be worth?

Mr. MALKIN: \$5,000, for the sake of argument.

Mr. NOBLE: This brings up a certain doubt in my mind. You said it would not be feasible for a policeman to carry this machine in his car. If this is so, it would necessitate having these breathalyzer machines available in a good many locations along the highway because, as you indicate, it is important to take these tests as soon as possible if you are to get a conviction. There would be a tremendous cost involved in having these \$5,000 machines available every 10 miles or so on our highways.

Mr. MALKIN: Well, Mr. Noble, in the interest of safety, I would rather let a few go through because if they get arrested and they get away with it by .01, they have had a warning, they know it and they are scared stiff. If you had these things dotted along the freeway, fine; but, take it from me, if they are not kept in a fairly dustproof place you are going to lose out on accuracy and it is again going to upset all of us. You know, a laboratory should be fairly clean to be accurate and this is most important. I would rather let a few drunks get away. Does that answer the question?

Mr. NOBLE: The only thing that worries me is the lapse of time from where the policeman picks a drunk up and gets him to a place to be tested.

Mr. MALKIN: Mr. Noble, this is a double-edged sword; it could go both ways. Maybe he has just taken a packet. Now, let me put it this way. If he had taken a packet straight—and we know by this it is going to keep him low—I would bet, if he took a lot of water to try to kill this, it would increase it because the pylorus muscle will let it all fly through.

An hon. MEMBER: You had better not make that common knowledge.

Mr. MALKIN: I have; I have said it on television many times.

Mr. MATHER: Mr. Chairman, a previous witness—I think it was Mr. Ward Smith—answered your question in some detail when he said how the breathalyzer works in Ontario.

The CHAIRMAN: Are there any further questions? We have Mr. Tracy from Little Current. He was particularly anxious to be here the same day as Mr. Malkin. I know that our time is getting pretty close to one o'clock, but I do not think Mr. Tracy will take too long. Would you come up, Mr. Tracy.

Mr. Tracy, I will forgo the introduction; you can introduce yourself.

Mr. J. DOUGLAS TRACY (*Little Current, Ontario*): My name is Doug Tracy. I come from Little Current. We also regard it as the largest fresh water island in the world, but we do have our problems there too.

I bring the feelings of many drivers that wish to rid the fear of being hit by a drinking driver, as we believe the drivers have a perfect right to drive on the highway in safety if they have paid the vehicle licence, gas taxes, and so on, and obey the laws. For any infringement of this written or unwritten rule, the drivers should be taken off the road. The innocent should be protected, not the guilty.

I am sure you gentlemen want to learn all the facts about such an important step in Canada's history. Mr. J. Wadsworth's research findings in his technical note No. 3, written for the National Research Council of Canada, deals with this subject very well, and would prove to anyone who has any doubts of what is really happening in this field—it would be wise to read it. It has been proven that alcohol is the major cause of automobile accidents and 50 per cent of highway deaths. My knowledge in this field is based on first hand knowledge and the above figures certainly are true—as our district Ambulance driver and Funeral Director I am one of the first on the scene. As you arrive one first sees the red light of the police car and then the scene of confusion: glass on the road; one or two cars on either side; people lying on the ground covered with blankets or coats some kind passing motorist has lent; someone trapped in the car, sobbing or crying but wondering how the other people are; some walking around in a state of shock wondering how this could ever happen to them. Generally, beer or liquor bottles are broken in or out of the car and it smells strong of the odour. Usually the driver that is known to have been driving and drinking gets off with the least injury. Then comes the task of lifting the injured onto the stretchers. This is where the onlookers—and I must give credit to them—will help so the patient can be lifted level in fear of back injury, even though it means getting blood on their hands and maybe their clothes, which does not come out easily.

The doctors have quite a task ahead in getting the person well again. And in the 100 per cent I get of the 50 per cent figure I have to admit I usually have quite a task ahead in making the body presentable. This is what the doctors and myself could do without. Gentlemen, by having the Compulsory Breathalyzer Test, this will prevent the needless slaughter on our highways. I would like to suggest that the blood test, as taken by a doctor, be done for all drivers involved in all cases where there is injury or death. The innocent person has nothing to lose by giving a test; the guilty has. Is this why such an important amendment is not being passed?

Gentlemen, a wonderful way to start our important year of 1967 would be to provide safety in this field for our Canadian people across the nation, and especially those travelling to and from Expo 67. The public want it. Thank you.

The CHAIRMAN: Thank you. I think, Mr. Tracy, you should have probably told them not only have you been first hand on the scene but that you are also a funeral director.

Does anyone wish to ask any questions of Mr. Tracy?

Mr. HONEY: Do you take a drink, Mr. Tracy? You are not a teetotaler?

Mr. TRACY: Yes, I do. I am not a teetotaler.

Mr. NOBLE: Mr. Chairman, not being a member of the committee, I am wondering if there are any extra copies of Mr. Malkin's brief?

The CHAIRMAN: I think so. That, gentlemen, concludes the presentation of evidence. I think we should ask Mr. Malkin which one of these he thinks we should have as exhibits. We have Senate Bill No. 3 already.

Mr. MALKIN: This California one is very important. It is extremely well done.

The CHAIRMAN: It is entitled "The roles of carbon monoxide, alcohol and drugs in fatal single car accidents" together with some related material.

We have this safety law of the United Kingdom. What about this alco test?

Mr. MALKIN: I would like you to have it, if there is room for it in the file because I would like the committee to have available such a gimmick, if you like, or a crutch for the policeman.

I know that Mr. Bonner is thinking strongly about using one of these. They have not just made up their minds which one. I know that the United Kingdom will have this Road Safety Act in effect not later than June of 1967—they have given this to me as absolute—and that they will use such a crutch to put the policeman in the position, does he go ahead or does he let the man off with a warning.

The CHAIRMAN: May I have a motion that the documents that I have referred to be made exhibits to today's proceedings?

Mr. TOLMIE: I move that the documents mentioned be made exhibits to today's proceedings.

Mr. HONEY: I second the motion.

Motion agreed to.

Mr. TRACY: May I say Mr. Chairman that any exhibits I could bring would not be presentable.

The CHAIRMAN: At our meeting on Thursday, Mr. Ron Basford will be making his statement on his notice of motion relating to the removal of insurance vending machines from airports. A lawyer from Toronto, Mr. Anthony Bazos, through Mr. Reid Scott, a member of the committee, has indicated that he wants to appear before the committee. I believe he will be appearing

more or less in the capacity of a defence counsel, against the breathalyzer test. Our principle is to hear both sides of the problem and we will be having those two gentlemen.

In conclusion, Mr. Malkin and Mr. Tracy, we wish to thank you most sincerely for your appearance here today. You and Mr. Malkin, as I have stated, have made a distinguished contribution to the subject matter. Mr. Tracy has come here to express the view of the average Canadian citizen.

We wish to thank you both most sincerely for your attendance.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 13

THURSDAY, OCTOBER 27, 1966

Respecting the subject-matter of

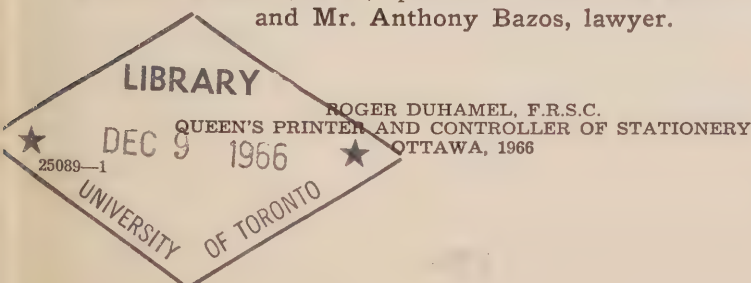

Bill C-87, An Act to amend the Criminal Code (Impaired Driving)

and

Private Members' Notice of Motion Number 32.

WITNESSES:

Mr. Ron Basford, M.P., sponsor of Notice of Motion No. 32;
and Mr. Anthony Bazos, lawyer.

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS
Chairman: Mr. A. J. P. Cameron (*High Park*)
Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Laflamme,	Mr. Ryan,
Mr. Choquette,	Mr. Latulippe,	Mr. Scott (<i>Danforth</i>),
Mr. Chrétien,	Mr. MacEwan,	Mr. Tolmie,
Mr. Fulton,	Mr. Mather,	Mr. Trudeau,
Mr. Goyer,	Mr. McCleave,	Mr. Wahn,
Mr. Grafftey,	Mr. McQuaid,	Mr. Woolliams—(24).
Mr. Guay,	Mr. Nielsen,	
Mr. Honey,	Mr. Otto,	

¹Replaced Mr. Bell (*Carleton*), Thursday, October 26, 1966.

Timothy D. Ray,
Clerk of the Committee.

ORDERS OF REFERENCE

TUESDAY, October 25, 1966.

Ordered,—That the Standing Committee on Justice and Legal Affairs, be granted permission to adjourn from place to place; and that it be authorized to sit while the House is sitting when meeting beyond the precincts of Parliament; and that the Clerk of the Committee and the necessary supporting staff accompany the said Committee.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House of Commons.

WEDNESDAY, October 26, 1966.

Ordered,—That the name of Mr. McCleave to be substituted for that of Mr. Bell (*Carleton*), on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House of Commons.

MINUTES OF PROCEEDINGS

THURSDAY, October 27, 1966

(16)

The Standing Committee on Justice and Legal Affairs met this day at 11.25 a.m. The Chairman, Mr. Cameron presided.

Members present: Messrs. Cameron (*High Park*), Choquette, Forest, Goyer, Honey, Latulippe, Mather, McCleave, Ryan, Tolmie, Trudeau, Woolliams (12).

In attendance: Mr. Ron Basford, M. P., sponsor of Notice of Motion No. 32.

The Chairman read the Fourth Report of the Subcommittee on Agenda and Procedure, which is as follows:

Your subcommittee met on Wednesday, October 6, 1966, at 3.30 p.m., and has the honour to present its

FOURTH REPORT

1. That, regarding the trip to the testing and research facilities of the automobile industry in Detroit, the Committee leave late in the afternoon of November 8 for Windsor, tour the facilities on Wednesday, November 9, hold a meeting the evening of November 9, tour the facilities the morning of Thursday, November 10, hold a meeting the afternoon of November 10, and return to Ottawa the same day after the meeting.

2. That Dr. Ward Smith be invited to reappear before the Committee re Bill C-87.

3. That the Committee begin hearing witnesses re Bill C-105 (insanity) and Bill C-176 (insanity at time of trial) on November 15, 1966, providing all witnesses have been heard re Bills C-27, C-49, C-87 and notices of motion 26, 31 and 38.

On motion of Mr. Mather, seconded by Mr. Forest,

Resolved,—That the Fourth Report of the Subcommittee on Agenda and Procedure be adopted as read.

The Chairman introduced Mr. Ron Basford who made a statement on his notice of motion relating to the removal of flight insurance sales facilities in airports.

Mr. Basford stated that the Canadian Airline Pilots Association, the Association of Air Flight Attendants, the Canadian Coroners Association and the Canadian Bar Association (B.C. Branch) would possibly be interested in appearing before the Committee.

The Committee then proceeded to the questioning of Mr. Basford.

It was suggested by the Committee that officials from the Department of Transport, concerned with air flight insurance, be called before the Committee.

Mr. McCleave asked that the Canadian Airline Pilots Association be asked if they might suggest a means of checking baggage sufficiently well to prevent the transport of explosives aboard commercial aircraft.

At 12.35 p.m. the Committee adjourned until 3.30 p.m. the same day.

AFTERNOON SITTING

(17)

The Standing Committee on Justice and Legal Affairs reconvened this day at 4.30 p.m. The Chairman, Mr. Cameron presided.

Members present: Messrs. Cameron (*High Park*), Chrétien, Forest, Goyer, Latulippe, MacEwan, Mather, McCleave, Ryan, Tolmie, Woolliams (11).

In attendance: Mr. Anthony Bazos, Lawyer.

The Chairman introduced Mr. Bazos and invited him to make a statement re Bill C-87 (impaired driving).

On motion of Mr. Mather, seconded by Mr. McCleave,

Resolved,—That Mr. Bazos' brief be made an appendix to today's proceedings (see Appendix 7).

On motion of Mr. McCleave, seconded by Mr. MacEwan,

Resolved—That the 1964-5 Report of the Minister, Ontario Department of Transport, and Accident Facts, 1965, Ontario Department of Transport be made exhibits (see Exhibits 12 and 13 respectively).

At 5.55 p.m. the questioning continuing, the Chairman, Mr. Cameron, asked Mr. Forest, the Vice-Chairman, to assume the Chair.

At 6.25 p.m., the Vice-Chairman thanked Mr. Bazos for his contribution and the Committee adjourned to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

THURSDAY, October 27, 1966.

The CHAIRMAN: Gentlemen, we have a quorum. My first duty, which is a very pleasant one, is to welcome Mr. Robert McCleave as a member of this committee. He is replacing Mr. Bell, who is very busily engaged in another committee which, I believe, is meeting twice a day. We are very, very glad indeed to have you with us.

Gentlemen, your subcommittee met yesterday afternoon in my office and I will read their report:

Your subcommittee met on Wednesday, October 26, 1966, at 3:30 p.m., and has the honour to present its:

FOURTH REPORT

1. That, regarding the trip to the testing and research facilities of the automobile industry in Detroit, the Committee leave late in the afternoon on November 8 for Windsor, tour the facilities on Wednesday, November 9, hold a meeting the evening of November 9, tour the facilities the morning of Thursday, November 10, hold a meeting the afternoon of November 10, and return to Ottawa the same day after the meeting.

2. That Dr. Ward Smith be invited to reappear before the Committee re Bill C-87.

3. That the Committee begin hearing witnesses re Bill C-105, (insanity) and Bill C-176, (insanity at time of trial) on November 15, 1966, providing all witnesses have been heard re Bills C-27, C-49, C-87 and notices of motion 26, 31 and 38.

This applies to safety devices on motor vehicles. This report was respectfully submitted by myself as chairman.

Is there any discussion on the report?

Mr. TOLMIE: There is a question, Mr. Chairman, of Dr. Ward Smith returning. There was also mention of Dr. Roussel.

The CHAIRMAN: That is perfectly true.

Mr. TOLMIE: In case we need him after those two witnesses who appeared before the Bar of the province of Quebec. He is quite an expert on the breathalyser and I think it would be worth while if we could hear him. He could be a new witness in place of Dr. Ward Smith, or he could appear with Dr. Ward Smith.

The CHAIRMAN: I would prefer Mr. Ray answer that because he has been in touch with Dr. Ward Smith about it. Possibly you could tell the committee what the report is from Dr. Ward Smith.

The CLERK OF THE COMMITTEE: I spoke to Dr. Ward Smith this morning about appearing on November 8, and the first day he has free is November 22. I suggested Dr. Roussel and he said he would very much like to appear with Dr. Roussel on November 22.

The CHAIRMAN: He expressed some very high opinion about his qualifications, too, did he not?

The CLERK OF THE COMMITTEE: He said that Dr. Roussel was not an expert in the actual operation of the breathalyser itself but he was certainly an expert on the related factors surrounding this. Dr. Ward Smith thought very highly of him.

The CHAIRMAN: My memory of it is that at the next meeting of the subcommittee we would take it up and would decide whether we wanted to call Dr. Roussel as well as Dr. Ward Smith. Is there any other discussion?

Mr. TOLMIE: What is the date mentioned, Mr. Chairman?

The CHAIRMAN: November 15.

Mr. TOLMIE: I mean regarding the trip?

The CHAIRMAN: To Detroit? November 8, two weeks from today.

Mr. RYAN: Mr. Chairman, regarding the date for the proposed trip to Detroit, I think it was decided that we would find out the opinion of the member on whether they could go at that time and whether transportation would be finalized at that time.

The CHAIRMAN: Well, on the basis of this report, if you do decide that is satisfactory time to go, November 8, 9 and 10, I have already been in touch with Mr. Pickersgill's office to see what can be done about arranging transportation and necessarily the department would want to have a motion on the record that we would be going on these days. Now is the time to say whether that is a good day or whether we should try to select some other day. These dates seemed to fit in with our plans in the best way possible.

Mr. RYAN: For the period November 7 to November 20 I will be out of the country on parliamentary business. I do not think it affects anyone else on the committee. I would ask that I be replaced on the committee. I regret very much I will miss this expedition.

The CHAIRMAN: Will you speak to the whip about it so that your replacement may make this trip? Please return to the committee when you come back.

An hon. MEMBER: What time of day will we leave?

The CHAIRMAN: I do not think it would be too early in the day, probably early evening, six, seven or eight o'clock, just time enough to get to Windsor. We will be back on Thursday.

Mr. TOLMIE: Friday is a holiday, is it not?

The CHAIRMAN: Friday is a holiday, Remembrance Day.

Any further discussion? Do I hear a motion that this report be accepted?

Mr. MATHER: I so move.

Mr. FOREST: I second the motion.

Motion agreed to.

The CHAIRMAN: We now have before us Mr. Ron Basford, the distinguished member for Vancouver-Burrard who propounded the following motion in the house.

That, in the opinion of this House, the government should give consideration to the advisability of amending the government airport concession operations regulations to provide, by virtue of its power to regulate the performance of any service for persons on the airport, that no licence be granted by Her Majesty in Right of Canada for the operation of insurance vending machines.

I do not need to introduce Mr. Basford to this committee. We all know him, respect him and honour him for his ability and we would be very glad to hear from you now, Mr. Basford.

Mr. BASFORD: Thank you very much, Mr. Chairman and hon. members. I hope to be very brief this morning.

I introduced this motion, and the remarks on it are contained at page 8362 of *Hansard* for October 5. I have some additional copies here if anyone wishes to have one.

The subject matter of the motion which the Chairman has read was referred to this committee by the Solicitor General and it allows this committee, it seems to me, to enter into a full examination and investigation of the subject of flight insurance generally. You will note that my resolution deals specifically with flight insurance sold through vending machines, which are located at all of our airports operated by the Department of Transport. However, this is the first time in Canada, of which I am aware, that such an inquiry has been held and I would urge the committee, in discussing and examining into the subject matter of this resolution, to consider the whole matter of flight insurance, whether sold by vending machines, pretty little girls behind counters in the airports or by regular insurance agents. While all of us, I am sure, recognize that for most purposes there is a good deal of difference between pretty little girls and vending machines, I think in the sale of insurance there is really very little difference because, if one has ever bought flight insurance either from the manned or pretty girl counters in the air terminals or from a vending machine, one will notice that the type of application is almost identical and that there is really no examination of the applicant who wants the insurance.

I do not want to go this morning into all of the technical detail that has been amassed on the subject because I would hope and expect that the committee will be hearing from the Canadian Air Line Pilots Association, which I believe has already been in touch with your Chairman. This association, which represents the air line pilots of Canada, has done a great deal of work on the subject of flight insurance and on the subject of flight insurance vending machines specifically. They are anxious to appear before you and give you the technical detail and the information that has been amassed on this subject. I think, as I tried to demonstrate in my speech in the house, that the evidence which has been accumulated indicates that there is a definite connection between the purchase of air line flight insurance and sabotage on aircraft and that there have been a

number of very serious air line bombings and sabotage, resulting in loss of life, which can, I think, definitely be linked to the purchase of flight insurance.

Now, the object of this resolution, and the object of those who favour doing away with the vending machines and/or the counters in the air terminals, is not to do away with flight insurance. I would like to make my position very clear on that. People can buy trip insurance for any mode of travel and they should be allowed to buy trip insurance if they want to travel on an aircraft. What is aimed at here is the person who can go to an air terminal and put 25 cents, 50 cents or 75 cents in a vending machine and insure his life or the life of someone else for a great deal of money without any examination of his financial stature, his mental state, purpose of the insurance, or anything else. What we would like to see, if people want to insure themselves for travel, is that they buy this insurance as they would any other type of insurance where you have to apply to an agent, who has the right to accept or refuse your application and who generally carries on some form of investigation of you and your standing and stature and makes a decision on whether you are a fit person to be insured. This, of course, is something which no vending machine can do. That is why it is suggested that vending machines are an invitation to maniacs to insure either themselves or members of their families, or in some cases unrelated persons, for large sums of money and then sabotage the aircraft. Anyone who is mentally deranged, of course, does not fear a vending machine. It is very easy for that sort of person to work out his plans for bombing or sabotage and they buy the insurance through a vending machine. If that same person had to apply to an agent, had to be examined, had to be known, I suggest that the chances are that he would find some other way of either eliminating himself or a member of his family he wanted to eliminate. Certainly doing away with vending machines is not going to stop people committing suicide or people murdering others but it is, I think, going to help prevent them at the same time they do away with themselves, or some member of their family whom they want to eliminate, from killing a good number of innocent people who are also, of course, killed when an aircraft is sabotaged.

I think the committee, Mr. Chairman, will probably want to examine some other suggestions that from time to time are made in this connection, as I think was touched on by Mr. Mather in the house; that is, rather than outlawing the machines or the counters entirely, by putting restrictions or limitations on the amount of insurance that can be carried on any one life and by limiting the number of people or the type of people who can be named as beneficiaries. There are cases where people have insured others totally unrelated to themselves. One example is a case which occurred on September 24, 1952 in Mexico City when a bomb exploded in the baggage compartment of a Mexican air lines DC-3. It had been placed aboard by two men who had insured seven passengers for a total of \$208,000. The suggestion is made from time to time that people on air flight or trip insurance should only be allowed to insure their immediate family; their wife, husband, children or parents. The suggestion is also made from time to time that there be a limitation on the amount of insurance that may be carried; in this case \$25,000 or \$50,000. It is thought this would allow people who are concerned or nervous about flying to insure themselves, and it would fill that need, but would help to prevent those wanting to insure people in order to amass, either for their own estate or for the estate of someone else, a great deal of money.

I would be happy, Mr. Chairman, to answer any questions on this subject, although I do not in any way purport to be an expert. I would hope that the committee in making its examination would, as I say, hear from the Canadian Air Line Pilots Association and from the Canadian Air Line Flight Attendants Association, who represent the stewardesses and the stewards, who are also concerned in this matter. I mentioned that so far as I know this is the first time such an inquiry would be held in Canada. The Canadian Coroners Association has been making a study of the subject but has not yet reached any conclusion. The Canadian Bar Association, particularly the British Columbia branch, has been working on this matter through their air law section but to my knowledge have not yet come to any conclusion. I would think that it might be valuable to contact those four groups to see whether they would like to make representations to the committee.

There is, Mr. Chairman, an opportunity here, I suggest, for fairly speedy action because in most of our committee deliberations we are concerned with legislation suggesting a bill or amendment to bills. Here we are dealing with regulations and if the committee wants to take action all it need do is recommend an amendment be made to regulations by the Governor in Council.

Most of the airports in Canada are run by the Department of Transport, which has complete control and authority over what goes on in terminals and whether people can put up vending machines, counters, newsstands, U-Drive or car rental stands. All that need be done here to get action is for the Department of Transport to amend its regulations to prevent leasing of space in air terminals to the insurance companies operating in this business.

Therefore, if the committee makes a recommendation, there is really very little reason or excuse for any delay in implementing that recommendation.

Mr. Chairman, I said I would be brief. That is all I would like to say at the moment by way of introducing this subject. I think you will have people before you, particularly the Canadian Air Line Pilots Association, who are far more competent than I to go into the details of this matter. I would now be happy to answer any questions.

The CHAIRMAN: Thank you very much indeed, Mr. Basford. We have already heard from one or two of the organizations you have mentioned. Mr. Basford is now open for questioning.

Mr. RYAN: I would like to ask Mr. Basford, relating to the Department of Transport, under what act these regulations exist with respect to licencing?

Mr. BASFORD: Under the Department of Transport Act.

Mr. RYAN: The federal government of course, has some jurisdiction over insurance but it does not have entire jurisdiction, does it? I believe the provinces have their own insurance acts as well.

Mr. BASFORD: Yes. This is a constitutional problem and one that has also created a problem in the United States, where there has been a good deal of litigation over the years for some similar action. There have been bills introduced both to the Senate and the House of Representatives in this connection. They have run into this same problem in the United States where the states also have jurisdiction in matters of insurance. That is the reason why, Mr. Ryan, I have introduced the motion simply dealing with the operation of air terminals because here is a possible constitutional problem in Canada whether the parliament of

Canada could pass legislation dealing with trip insurance as such. I really think what we are dealing with here is the sale of insurance at air terminals operated by the Department of Transport and over which, of course, we do have control.

Mr. RYAN: Yes, but you did mention that in some places life insurance is saleable on the basis of the main beneficiary being other than a preferred beneficiary or a beneficiary for value. In the province of Ontario I do not believe it is possible to name a beneficiary outside the preferred class unless it be for value or some special circumstance. I take it from your remarks that there are places in Canada where a man can go into an airport terminal, buy a policy on his life, go up in the plane and have a great deal of money under an air flight insurance policy assigned to someone who may not be related to him in any way or have any claim in any respect against his estate. Is this so?

Mr. BASFORD: Yes, I am suggesting that is so. You can, with a vending machine, list anyone you wish as a beneficiary. I think you have raised an interesting point, in that if a complete stranger were named as a beneficiary and endeavoured to collect on the insurance, then he would face the possibility of the company denying liability and not paying. There undoubtedly would be litigation in that event.

Mr. RYAN: That is an area that would certainly appear to need over-all control across Canada?

Mr. BASFORD: Yes, although that is not what my resolution deals with, and I suggested—

Mr. RYAN: But you have advanced it as an argument for doing away with these machines.

Mr. BASFORD: No, I did not advance it as an argument. I said there had been other proposals made. Rather than doing away with air line insurance that there be other approaches taken, such as limitation to the amount of insurance that could be carried or to the class of beneficiaries who could be named. I do not particularly favour those approaches but I put them before the committee as two approaches that had been suggested and they were two areas I thought the committee would probably want to look at.

Mr. RYAN: Are you concerned at all with the mailing out of applications by these air flight insurance companies to individuals whom they know are going on flights and have made reservations? The application is mailed in to the company, the man goes on his flight, and if there is an accident the money is paid to the beneficiary whom he named in his application. This is done in respect to some commercial flights, particularly by these same insurance companies—

Mr. BASFORD: Are you referring to the case where you fill in an application through a vending machine?

Mr. RYAN: No, it is where it has been mailed or placed in your hand. They know you are going to be a passenger on a certain flight.

Mr. BASFORD: This is a practice of which I am not aware.

Mr. RYAN: What you are mainly interested in is obtaining the support of this committee for the prevention of the sale by vending machines in airports on the basis that someone with an insane impulse, or even a psychiatric impulse, is tempted by their very existence. The power of suggestion to them is very great to buy insurance for an evil purpose.

Mr. BASFORD: I think you will find from the evidence that will be presented by the Canadian Air Line Pilots Association that there are documented cases of people who either want to kill themselves, or murder their wives or their mothers-in-law, who have picked air lines as a way of doing it because they have been able to buy insurance very easily and at the same time, as well as eliminating themselves, have been able to leave their estate a fairly substantial sum of money. People, in trying to eliminate their wives or mothers-in-law, have been able to enrich themselves. If this insurance was not easily available they would probably still commit suicide but would do it by jumping off a bridge or by some other means. But because this insurance is so readily available without examination and, without investigation, I suggest they then use air line sabotage as a method of accomplishing what they want to do. This, of course, kills a number of innocent people.

Mr. RYAN: I am also interested in a couple of paragraphs from your speech in the House on October 5, 1966, where at page 8364 of *Hansard*, the last two paragraphs in the second column, you say:

A former United States federal aviation agency administrator has called flight insurance a 'gyp'. The odds against being killed in an air crash in Canada are 276,000 to one. Flight insurance pays off at 30,000 to one, or only a tenth of the true odds.

Accidental death and double indemnity policies, which are more normal, pay off at about half the true odds. True they are more expensive—\$35 a year for \$30,000 coverage—but they are payable for any accidental death, the chances of which are one in 1,755 per year, compared to one in 276,000 for a plane trip.

Now, are you seeking a reformation of the odds here or seeking in any way to control this situation, which does seem to be a rather fantastic one?

Mr. BASFORD: No, what I was really trying to suggest—and I did so in another paragraph in that speech—is that I think air line insurance is really quite unnecessary. Air travel is now the safest form of travel in existence and yet people seem to have a great fear of it and seem to be very insurance-conscious about it. I think that fear is rather silly. If people want to buy trip insurance that is a freedom I am not going to take away from them. Generally I think they are being rather foolish in spending money on it.

Mr. RYAN: You are not concerned with possible unfair profits being made by the companies?

Mr. BASFORD: I am concerned, but this is a free enterprise society and if people want to buy insurance which is a very bad buy, that is their right I suppose. I think the odds show it to be a very bad buy.

Mr. RYAN: I will pass, Mr. Chairman. Thank you very much.

Mr. WOOLLIAMS: I would like to ask a couple of questions. I do not want to get into a legal argument on this because I am sure you have done research on it and I must confess I have not. I am merely seeking information. I do not know whether you were suggesting or not, Mr. Basford, if it could be proven that a person bought insurance, got on the aircraft and then blew himself up with the others, which is basically suicide, that he could collect on the insurance?

Mr. BASFORD: Well, I would say offhand—although I have done some studies I do not profess to be an expert—if that could be proven, no, his estate could not collect. But the hope, of course of anyone doing it is that all of the evidence would be destroyed. It is never proven.

Mr. WOOLLIAMS: Well, that is the point I wanted to make, that basically—I think I am correct on this and I think you will probably agree with me—if you can prove that to the satisfaction of the court either by circumstantial evidence or direct evidence, then the insurance policy would be void.

Mr. BASFORD: I would agree with that, yes.

Mr. TOLMIE: Mr. Chairman, I have gone over the various speeches in the house and I have a few comments I would like to make.

I feel there is a very strong argument for the position that if you are going to retain over-the-counter insurance, then there is not much point in discarding the vending machine type of insurance because the same attraction would still exist for someone with a deranged mind to come in and quickly and easily obtain insurance. Would that be a fair comment?

Mr. BASFORD: I think it is, although there would be some who would argue because they have to confront the girl face-to-face that this is a deterrent. I do not think it is a very great deterrent. This is why I have said for all practical purposes the vending machine is the same as the girl behind the counter.

Mr. TOLMIE: Now, another point. As I understand it, the main purpose of the motion is to help to prevent the rare occurrence of planned sabotage; in other words, where a person is willing for material gain to plan a bombing, plan the destruction of an aircraft in order to benefit financially.

I think one of the main arguments is that if this entails so much planning—and I agree that it does—then the elimination of obtaining insurance at an airport I do not think is going to thwart anyone who has definitely and methodically made this plan. He is going to be able to get the insurance through an agent. Therefore, by eliminating the insurance at an airport, what you are really doing is perhaps catching the very rare occurrence of someone with a deranged mind who appears suddenly and for some psychotic impulse buys it. Now, this is perhaps more of an argument than a question. I would like to get your comment later.

I think that the very strong argument for retaining this insurance—and this is a very difficult subject, as we know—is the fact that I believe there are thousands of travellers, and there will be more, who do not travel very often. They are nervous, they make hurried preparations, they do not go to the trouble of inquiring about insurance, they do not go to the agent, they do not even think about it. They get to the airport and all of a sudden they say to themselves, "My wife and my family are flying for the first time, I want to protect them." They see the vending machine, they see the easy accessibility of flight insurance and they are able to get it. I think this is the point that we should not overlook in our efforts to prevent sabotage.

I think another point which has not been mentioned is the situation in the United States. As I understand it, according to Mr. Stanbury's argument, detailed study of air line sabotage was done about a year ago and the Federal Aviation Agency came to the conclusion that air line saboteurs are beyond the reach of any reasonable approach, and the removal of air port insurance vending

machines would not achieve the purpose intended. They concluded that sabotage usually requires prior planning and the sale of insurance at airports would not be a major factor in such prior planning. I just bring that up to get your comment on the situation. The Americans have evidently investigated this and they have come to completely diametrically opposed conclusions to those which would be effected by your bill. One further point is that you state, and rightly so, that air travel is safe now. Air travel will increase, air corridors will become more crowded, and perhaps rather than making it more difficult to get air insurance the trend may be that air insurance should be more available in view of the fact there will be more air travel, more danger and more people travelling.

Now, these are just arguments advanced—they are not really questions—and I would like to get your comments on some of these matters.

Mr. BASFORD: Well, I do not entirely accept the proposition that because these operations involve a good deal of planning you should leave the vending machines there. Undoubtedly someone who is intending to blow up an aircraft, either for purposes of committing suicide or murder, has to go through a good deal of planning. What I am suggesting is that by reason of the fact that he can obtain flight insurance so easily, he is invited to plan the murder or the suicide by way of aircraft sabotage. If it was not so easily or readily available he would pick some other method of committing the murder or the suicide.

Mr. TOLMIE: These are your comments on the American agency and their conclusions?

Mr. BASFORD: Yes. This was a subcommittee of what is called the Federal Aviation Agency. That was the conclusion that particular committee came to, which is composed of a representative from the Civil Aeronautics Board, the Federal Aviation Agency, the Department of Justice, the Air Transport Association, the Airport Operators Council and the vice president and council of American for Loyalties group insurance companies. I challenge some of the conclusions they came to, I do not agree with them. They also ran into the constitutional problem of whether, in fact, they could impose some restrictions on it.

Mr. TOLMIE: That is all, Mr. Chairman.

(Translation)

Mr. CHOQUETTE: Simply this. One question to Mr. Basford. This might have been said already; however, I will put the question anyhow. There is at present a system used by certain banks where they used electronic machines. When somebody goes to the wicket, he is immediately photographed. Do you believe that this might conceivably be an efficient means that could be used, in such instances, in the control of such vending machines?

(English)

Mr. BASFORD: I do not know, Mr. Choquette. It is a novel idea to me. Whether it has been explored before or not I do not know. My first impression is that if someone has to be photographed this certainly would act as a deterrent. That is my initial reaction to it.

Now, there have been examinations carried out, I believe, by our own department and certainly in the United States this has been done, and I am sure

that the Canadian Air Line Pilots Association will be able to add to this. Speaking of devices that people have tried to develop in one way or another to detect bombs, my understanding of it is that no effective machine has yet been designed. I refer here to some type of X-ray machine which discloses bombs in luggage or detects the fumes of the explosive, this sort of thing, a breathalyzer for bombs. Whether they have examined the question of photographing people or not, and what effect it would have, I do not know. It is a novel idea to me and one that perhaps should be looked at.

(Translation)

Mr. CHOQUETTE: What you are suggesting is the elimination of these vending machines because it becomes far too easy to buy the necessary insurance. This being the case, the person who wishes to buy insurance should be photographed. If this were done, there is some type of protection provided, and this could serve to prevent some of the abuses you have been denouncing.

(English)

Mr. BASFORD: Well, I said, at first blush, I thought that would have a deterrent effect. How much, of course, is a matter of argument. Of course, anyone buying insurance, if he is going to collect on it, should have to identify himself on the form by name and address. I think you could argue that the taking of a photograph would not constitute much of a deterrent.

(Translation)

Mr. CHOQUETTE: In any event, you think this deserves consideration?

(English)

Mr. BASFORD: Well, I think so. It is a novel idea to me and whether it has been considered by experts or not, I am not aware. I think it should be given some thought.

(Translation)

Mr. CHOQUETTE: May I say, Mr. Chairman, that I insist that that matter be taken into consideration.

(English)

Mr. MATHER: Mr. Chairman, as one who is sympathetic with the purpose of Mr. Basford's bill, I would like to ask him one or two questions.

Is it fair to say that your contention is that life insurance vending machines located in airports offer a unique or special type of encouragement or inducement to destruction?

Mr. BASFORD: Yes. They offer an inducement to people who, speaking about suicide, for example, are thinking about committing suicide on an aircraft by way of sabotage rather than in some other way. There is psychiatric evidence—mentioned this very briefly in my speech in the house and I think the air line pilots will go into it further—to the effect that people committing suicide still feel a responsibility to their wives and their families and can face suicide a little easier knowing that their families are looked after, and therefore they pick air line sabotage as a method because they can do this very easily by plugging quarters into a machine.

Mr. MATHER: I believe I am right in thinking that your bill is aimed at the machines and the sale of life insurance within airports because of the fact that the operation of airports is a federal matter. Consequently, if the committee decided to do anything about this, it would be an area in which we could legitimately hope to act because of the federal responsibility?

Mr. BASFORD: That is right, by eliminating vending machines from Department of Transport airports. I cannot give you a precise figure, but I am prepared to say you would eliminate 98 per cent of the vending machines in Canada.

Mr. MATHER: Would you agree that the committee might also give consideration to regulating not only this type of retail outlet of flight insurance but regulating flight insurance itself? I do not know if I am in order, but I would like to put forward an idea that some insurance people put to me. Rather than permitting the unrestricted purchase of large sums of flight insurance for people such as aunts or distant relatives, or people who are not related at all, there should be some regulation of flight insurance to provide a replacement value for the breadwinner in the case of the family affected, such as a reasonable lump sum payment and perhaps monthly payments as well. In other words, flight insurance itself, rather than just the retail outlet, should be considered by this committee. Do you agree with that philosophy?

Mr. BASFORD: Yes. I mentioned in my opening that this was another approach or a different tack to the problem. However, I think in approaching the problem from the standpoint of putting either lump sum or beneficiary limitations on it that you run into the constitutional problems which Mr. Ryan mentioned.

Mr. MATHER: If it were possible for us to regulate the insurance, and if this committee, or whatever authority is involved, agrees to it, this would surely simplify the matter of where the retail outlets would be located. Also no matter where it was bought, the insurance would be of a particular type.

Mr. BASFORD: Yes.

Mr. HONEY: Mr. Basford, do you know of any jurisdiction that has attempted or does in fact regulate flight insurance by methods similar to what you propose, or by other methods?

Mr. BASFORD: No, I do not, but I am only familiar with the North American scene. It is not done either in Canada or the United States. This does not answer your question, but the International Federation of Air Line Pilots Association, which met in Auckland, New Zealand, from March 8 to March 15 of this year, passed a resolution on an amendment to the international rules urging that this be done, that is, that each contracting state should take steps to prohibit the sale of passenger flight insurance within any airport terminal.

Mr. HONEY: You have not made any inquiries with respect to the regulations in Europe.

Mr. BASFORD: No.

Mr. HONEY: I have reference in this question to Mr. Tolmie's suggestion that it is a convenience to have these facilities in airports, and I do not disagree with that. However, I do not think I give it the weight which Mr. Tolmie attributes to it.

Have you made any inquiries or do you know from your knowledge what is involved in the sense of time and trouble—if I could use that word—in obtaining, through a general agent, insurance for specific flights?

Mr. BASFORD: I could not tell you, Mr. Honey, because I have not inquired into it and I have never bought the insurance myself. I understand they are quite easily obtainable.

Mr. HONEY: Just one final question, then. As the sponsor of this resolution you have received, quite properly, quite a bit of publicity. Have you had representations from the Association of General Insurance Agents, for example, supporting the resolution or commenting on it?

Mr. BASFORD: No, I have not. I have had no comments from the insurance industry at all.

Mr. HONEY: Thank you.

Mr. McCLEAVE: Mr. Chairman, my first question arises out of Mr. Honey's last question. Could we arrange, Mr. Chairman, to have a representative of an insurance company attend to make representations and answer our questions as to the thoroughness of examinations by either pretty girls at airport counters or ugly insurance agents in their own offices. Could this be done?

The CHAIRMAN: We are going to have witnesses here.

Mr. McCLEAVE: Could the insurance agents be invited to attend?

The CHAIRMAN: The Canadian Air Line Pilots Association has asked to appear before the committee. There is also a letter from Messrs. Herridge, Tolmie, Gray, Coyne Blair, who represent clients who are interested in the matter, and they undoubtedly will wish to make representations when the subject is before the committee. I have no doubt that they will be invited to do so.

Mr. BASFORD: I do not put this forward as a complete list, there are a great many insurance companies who do not deal in this type of insurance, but the two names I have are Mercury International of Montreal and Tel-Trip Policy Company of Toronto. I believe Mutual of Omaha also does a great deal.

Mr. McCLEAVE: My second question I preface on a very brief observation, that as members of parliament we know the only way to prevent the visit of another Mr. Chartier is to see that nobody gets into parliament at all to see us at work. In other words, there is no complete guarantee against such incidents.

I think, Mr. Basford, the weakness in your case is that murder by sabotage in an airliner is really the objective and that insurance is a side benefit. So, the question I put to you is this. In making a submission would the Canadian Air Line Pilots Association be asked to present us with the best alternative that they can devise in checking luggage so that infernal weapons of murder are not taken aboard aircraft? They may say they do not like to do this because it is undemocratic, and so on, but could we ask for the very best opinion or solution that they can present to us on this subject?

The CHAIRMAN: I do not doubt that we can do that, Mr. McCleave. The clerk will make a note of your question. That is one of the first things we will ask them to deal with.

Mr. McCLEAVE: Could we have some information on how much federal revenue now comes from licensing air flight insurance vending machines?

Mr. WOOLLIAMS: Well, I would like to make this observation and then ask Mr. Basford to comment on it. I think first of all that the resolution, and I do not want to criticize the resolution nor do I want to get too legalistic, but from the constitutional point of view there is no question about it; it is well settled that the sale and administration of insurance is a provincial matter, and that is why we have a uniform insurance act and ten different acts across the nation. There is no doubt about it, I agree with Mr. Basford, we probably could control the vending machines, the selling of insurance in the depot itself, except possibly in the city of Calgary where the depot is still one of the few which is municipally owned. I agree with Mr. McCleave that if a person is intent on suicide or murder they can go to an insurance agent. It is something they plan for a certain length of time. If you look at suicide cases they have been planning it for some time. I do not think it is the vending machine that is at fault. He can go into an office downtown where he can buy insurance. I do not think this really encourages him to commit a crime; it may be just a fringe benefit, as Mr. McCleave said. I sincerely do not think that this is going to prevent this kind of crime.

Now, Mr. Basford may have statistics which will contradict my argument. I think the idea is good. Any time we can bring in any legislation to safeguard life on planes we should do so. I am thinking of the famous case of the jeweler who decided to blow up his wife. He was an invalid and felt his wife was fairly active in society without him, so he blew up the whole plane. Now, I do not think the vending machine had anything to do with his motives in that regard. He decided to murder his wife on that particular aircraft. If he wanted insurance as a fringe benefit, he could have obtained it anywhere because it is under provincial jurisdiction. Now, I would like some comment on this.

Mr. BASFORD: Well, I think the regulation of vending machines in terminals is an effective way for the government of Canada to deal with it. I maintain, if you wanted to eliminate most of the machines, this is an effective way of doing it. I think it would avoid all of the problems. As you undoubtedly know, Mr. Woolliams, you cannot operate a rent-a-car booth in an air terminal unless you are approved by the Department of Transport. However, the provinces do not complain that this is an invasion of their right to regulate U-drive motor vehicles, which they have jurisdiction over. I think this an effective way of dealing with the problem. It would exclude the city of Calgary, as you say.

Now, I have not gone into a detailed examination in the committee of all of the cases of sabotage. I thought I would leave that to the expert witnesses who will appear. They could give you a better résumé of all of them than I could. I am going to leave it that I think they will be able to show you that there is a link in a number of very serious accidents between vending machines and sabotage.

Mr. WOOLLIAMS: Well, it does seem to me there may be some records which could be built up from the witnesses, but the fact that someone decides to murder someone on a plane—call it sabotage or whatever word you want to use—it is a coincidence he happens to have insurance. I do not believe that was the motive, he would have done it anyway. Take out the vending machines. Let us go along with it. Say that the law allows you to take them out, and I agree with you, but I have not been convinced yet that if any of the witnesses say so

it would affect the record as to the safety of passengers when looking at the cases which will be reviewed in this regard.

Mr. BASFORD: Well, I disagree. I think you are misconstruing my argument. By eliminating flight insurance you will not eliminate air line sabotage entirely. Everyone agrees that you are never going to eliminate all bombings or all sabotage by eliminating insurance. But in any other area where safety is involved you do what you can to eliminate the causes of accidents and you go as far as you can reasonably go. In automobile safety this is surely what we are trying to do, or in accident prevention we are trying to go as far as we reasonably can. I suggest that there is a link between flight insurance and sabotage. Surely it is a reasonable proposition to remove that link or remove that one cause of sabotage. That is not going to eliminate sabotage entirely, that is admitted, but I think it is going to eliminate some of the causes.

Mr. WOOLLIAMS: Well, if those facts are true, it would be very difficult to prove one way or the other. If that happens to be true, then the fact that you take a vending machine out of a depot is not going to affect the situation, because you can go and buy this insurance anywhere else downtown or call your insurance man and do it before you leave.

Mr. RYAN: This is a check up system.

Mr. WOOLLIAMS: Yes because, as the Chairman has pointed out, if you sign your name and address you just cannot put down John Doe or sign an x or be incognito, you have to prove who you are. When you buy insurance at a vending machine you still have to sign a contract of insurance. If a false name is given the insurance will never be paid to anyone else. You have your name on the ticket. Your ticket and your name have to coincide before they pay any insurance.

Mr. BASFORD: I put forward the proposition earlier that certainly people have to identify themselves on the contract and sign the contract. But it would be the hope of anyone committing either suicide or murder by way of sabotage that any evidence of bombing would be destroyed.

Mr. WOOLLIAMS: But you can buy that insurance downtown. You do not have to go to a vending machine. That is my point.

Mr. BASFORD: But that is a different argument entirely. If you apply to your insurance agent, which you do when you buy life insurance or car insurance or insure your house, you are identified to your agent and he makes a conscious decision whether or not to insure you. That is a decision that a vending machine cannot make.

Mr. WOOLLIAMS: That is the strongest point you have made in reference to my argument.

Mr. BASFORD: Thank you.

The CHAIRMAN: Mr. Forest, Mr. Latulippe and then Mr. Tolmie.

Mr. FOREST: Would you or the Department of Transport have statistics on the percentage of air travellers who are buying insurance through vending machines, or could you get this information from the Department of Transport?

Mr. BASFORD: I think that the Department of Transport could give you those figures.

Mr. FOREST: I have seen vending machines in most airports. Do they have insurance counters in most airports? Do you buy either from a counter or from a vending machine in most airports?

Mr. BASFORD: From my own experience, I would say certainly at the major air terminals there are both types of sales made. I am sure the Department of Transport could give you the exact breakdown.

Mr. FOREST: Your bill was only intended to get rid of vending machines, not the counters?

Mr. BASFORD: Yes, except, as I said earlier, for practical purposes I see very little difference between the two.

(Translation)

(12.25 p.m.)

Mr. LATULIPPE: Mr. Chairman, would it not be possible, when people buy one of these policies at the airport, that the price of these be simply absorbed by the transport company? If there are accidents caused in order to collect insurance which anybody can take out, the difficulty would be eliminated if the transport company would pay the insurance in advance. Do you have any statistics to show what is the percentage of accidents we have had, the number of murders, the cases of sabotage, the number of bombs put in the aircraft, the number of suicides and so on? Do you have any figures on that?

(English)

Mr. BASFORD: I have some, but I would prefer the air line pilots to give you complete breakdown of the cases. I have a long list of them here.

(Translation)

Mr. LATULIPPE: It does seem that if the transport company involved was obliged to insure its clients, people would not have to take out any other type of insurance and the company would simply pay reasonable insurance and would not sell policies for several thousands of dollars, which would bring about disasters in many cases. I think this would make it possible to do away with these dangers we have been talking about. If people were not able to insure themselves other than through the policy taken out by the company itself, I think it might be a much better idea, this might remove the dangers we are talking about.

(English)

Mr. BASFORD: I agree, and it is a very interesting proposal. That would eliminate the need for flight insurance altogether.

The CHAIRMAN: Do you have another question, Mr. Tolmie?

Mr. TOLMIE: Just one short one. Mr. Basford put forward the argument that in his opinion if people were going to decide upon suicide, the presence of flight insurance might induce them to avail themselves of self destruction by aircraft more so than perhaps some other means.

Now, I think perhaps the argument is just the opposite. If I was going to commit suicide—and I think we all feel like it occasionally—I would take out a more comprehensive policy which was not specifically designed to cover an

aircraft accident. It would have to be included in the general coverage but it would not be specifically for that purpose. Then, perhaps six months or a year later I would arrange to have the aircraft blow up.

An hon. MEMBER: You have to wait two years, I think.

Mr. TOLMIE: Two years, yes. But I would not go down to the air terminal and buy flight insurance and then on that very flight find myself in a situation where I am killed. The authorities would, I think, be more prone to investigate my particular insurance application because it was designed specifically for that particular flight. So, I do not think that the presence of air flight insurance, either from a vending machine or over the counter at an airport, would induce people to commit suicide more this way than any other way.

Mr. BASFORD: Well, I think you are simply a more ingenious homicide, that is all. You have argued both ways this morning, Mr. Tolmie. First, that vending machines have no effect because suicide is a matter of great planning and second, you argue that it is not a matter of great planning.

Mr. TOLMIE: No, I was speaking of sabotage, not suicide.

Mr. BASFORD: Well, there are a hundred and one ways to commit suicide. You have picked another way, that is all, but suggest there are people who would pick this one.

Mr. McCLEAVE: Mr. Chairman, I did not give Mr. Basford a chance to comment before, but I now would like to ask a question which will give him an opportunity to do so.

I ask a very obvious question, Mr. Basford. It is a fact, is it not, that there are no vending machines selling dynamite or explosives in airports?

Mr. BASFORD: None that I am aware of, no.

Mr. McCLEAVE: Then how is the presence of the machine itself an incentive when the person has had to come to the airport with this murderous mechanism already in his luggage? How does the presence of the machine spark the operation you seek to guard against in your resolution?

Mr. BASFORD: I think the answer to that is as I said before; because the insurance is so easily and readily available, without someone having to make a conscious decision whether or not this person should in fact be insured, it encourages the person to pick this method of either committing suicide or committing murder. As I explained before, there is an indication that people who commit suicide, in spite of the fact that they want to commit suicide, are concerned over how they leave their wife and family and because vending machine flight insurance is so easily obtainable they pick this method of doing it.

Mr. McCLEAVE: So, the advantage is the machine does not ask questions?

Mr. BASFORD: That is right.

Mr. McCLEAVE: It is the interposition of the human factor which might be the one deterrent against such action?

Mr. BASFORD: That is right. If he has a very cold-blooded, psychopathic personality he probably would be prepared, as he is to buy dynamite, to go to an agent and be examined. But the vending machine would, I think, help to eliminate from such an examination a person with a very disturbed mind who

would be fearful of being personally examined but can go and plug quarters in machine.

The CHAIRMAN: I want to call to the attention of the committee that we have Mr. Bazos with us who is going to speak on impaired driving. It is now past half past twelve. I think we have the right to meet this afternoon, but we have Mr. Bazos here and I certainly want to give him an opportunity, either following the conclusion of Mr. Basford's testimony or this afternoon, to present his argument.

Mr. MATHER: Mr. Chairman, on that point, if it is agreeable to the committee and Mr. Bazos, I think we should conclude Mr. Basford's testimony, if possible, this morning and then have a meeting this afternoon.

The CHAIRMAN: Is that agreeable to you, Mr. Bazos, that you come back this afternoon? It will probably be between 3:30 and 4 o'clock because we have to be in the house until approximately that time.

Mr. MATHER: Mr. Chairman, I must preface my question with the statement that what I heard this morning makes me think that what we should try to regulate is not the type of retail outlet, the vending machine itself,—although I am sympathetic to that—but the actual type of insurance that is sold. In so far as money and insurance is a factor in aircraft destruction, I think we should consider the insurance itself no matter where it is sold.

I was interested in Mr. Latulippe's suggestion about the air lines selling insurance. In connection with that, could we request the air line companies to give us their views, as well as the air line pilots, on this problem?

The CHAIRMAN: I think that is a question for the subcommittee on procedure to deal with. We have heard from Mr. Basford. We have other witnesses who want to come before us. Mr. Ray has suggested we might get someone from the Department of Transport to give some statistical information. At the next meeting of the subcommittee we can decide whether we wish to hear any other witnesses.

It is agreed then, gentlemen, that we adjourn until after Orders of the Day. We will then hear Mr. Bazos.

We apologize, Mr. Bazos. I did not anticipate that we were going to go on. I thought after Mr. Basford made his statement there would be comparatively few questions, but this is a committee which is composed mostly of lawyers and you can see they have all asked questions.

We will meet in this same room and we are governed by the fact that most members want to stay until Orders of the Day are called. We cannot tell just how long that will take. We assume it will be somewhere between three-thirty and four o'clock.

AFTERNOON SITTING

The CHAIRMAN: Gentlemen, we have a quorum. I am going to call upon Mr. Bazos who will make his presentation to the Committee now. I do not think Mr. Bazos needs more than a very short introduction.

Mr. Bazos, is a lawyer who has practised in Toronto for a considerable number of years. He has been specializing in criminal law and he did achieve considerable notoriety owing to the fact that he did get a man off who, I believe

had been in Kingston for two years. He was charged with an offence which he did not commit. I call upon Mr. Bazos for his presentation.

Mr. ANTHONY C. BAZOS (*Toronto, Ontario*): Gentlemen, may I, please, before I enter into my remarks in reference to the submission I have to make draw to your attention that I, for a long period of time, had been under the impression that alcohol had been a substantial contributing factor to automobile accidents and also automobile accidents in which fatalities had occurred. This impression I obtained because of the fact I had heard a variety of people speaking about it at various meetings of the Canadian Bar Association, of which I am a member, over the last two or three years; also at various other meetings which I had attended and what I had read in the newspapers.

As I became aware of the fact that there was a bill pending, which is Bill No. C-87, and also being an active member of the criminal justice section of the Canadian Bar Association, the Ontario subsection for the last two years had been adamantly opposed to this compulsory breathalyzer test for a variety of reasons. So, when I ascertained that in fact this Bill No. C-87 was pending, and because I had personal views over and above this question of the percentage importance of alcohol to automobile accidents and fatalities, I decided I would ask to appear before the Committee and make a submission. As a result, I decided I would make certain inquiries and investigations into statistics.

In the first page of this short memorandum I have listed for the last six years the accidents that have occurred in metropolitan Toronto. I obtained these figures from the metropolitan police department.

The interesting part, for example, in the first year of 1965,—I will not go through the other years but I will just write them down—it showed that there were 29,818 accidents. As a result of this there were criminal charges of all descriptions which included arrests, summonses and Highway Traffic Act violations of 12,484. Of these total accidents there were personal injury accidents involving 4,110; property damage accidents involving 8,329 and there were 41 fatalities involving criminal charges. There were impaired driving charges laid in 1,106 instances which amounts to a percentage of 3.70 to the total number of accidents. The number of intoxicated charges under the Criminal Code for 1965 were 190; the number of fatalities from impaired driving charges were 4; the number of fatalities from intoxicated charges were 2. The personal injuries from impaired were 364; the injuries in intoxicated charges were 70.

For the other years preceding that, back to 1960, there was a corresponding increase to the extent that in 1964 it was 3.85 per cent; in 1963, 4.03 per cent; in 1962, 4.40 per cent; in 1961, 4.87 per cent and in 1960 it was .437 per cent. In addition to this, I attended at the Ontario Department of Transport and obtained from them a book which is entitled "Accident Facts 1965" which provides statistics relating to motor vehicle traffic accidents and I also obtained the 1964-65 report of the minister of the Ontario Department of Transport which also contains additional information. I summarize briefly in the following two or three pages what these figures disclosed and frankly it surprised me to some extent.

It was noted in the accident statistics book—the "Accident Facts" of 1965—that inattentive driving was the most frequent improper driver action recorded by the police as a cause of all accidents. They go further and state that in the age groups of 16 to 24 years, the other improper actions reported mostly

were in the following order. Speed too fast for road and traffic conditions; driver lost control or did not have right of way.

Dealing with the age groups of 25 to 64, the factors were, did not have right of way; driver lost control; speed too fast for road and traffic conditions.

In the age group 65 years and over, the important factor involved was they did not have the right of way.

In the number of accidents in Ontario, there were 192,384 of which the condition of the driver in 91.2 per cent of these accidents was apparently normal. Ability impaired was classed as 3,832, 1.8 per cent; 13,334 or 6.3 per cent as "had been drinking." Now these words, "had been drinking" means there was possibly alcohol on the breath but it was not a contributing factor to the accident.

More than 36.8 per cent of the total reported accidents occurred in urban areas, cities having a population of 10,000 or over but not including Metropolitan Toronto. Accidents in Metropolitan Toronto with about 25 per cent of the Ontario population made up 22 per cent of the total while 21.1 per cent happened on the main provincial highways.

In so far as fatal accidents are concerned, driver actions reported by the police in fatal accidents show that inattentive driving is the largest contributor followed by speed too fast for road and traffic conditions. The reported known condition of drivers involved in these accidents shows that 1,219 or 78.3 per cent were apparently normal, 45 or 2.9 per cent were classed as ability impaired, 266 or 17.1 per cent had been drinking.

I submit, gentlemen, that it cannot be argued in any way that alcohol plays in any way a major contributing factor to accidents on the highways based on the statistics to which I have referred.

A perusal of the charts and increased registrations and additional miles travelled—that is millions of miles travelled by automobiles—does not show any significant increase in the ratio to warrant any expression used by certain alarmists as "carnage on our highways as a result of the drinking driver." In fact, any such arguments, it is submitted have no foundation in fact. I base that on these two books and the statistics which I have obtained.

In relation to the question of the actions of drivers involving all types of accidents, which excludes fatal accidents, with which I will deal in a moment, the contributing factor in all accidents were as follows: Inattentive driving; did not have right of way; driver lost control; speed too fast for road or other traffic conditions, and finally, other actions.

In fatal accidents, inattentive driving; speed too fast for road or traffic conditions; on wrong side of road; driver lost control; did not have right of way. When you compare the various age groups it is established that the younger drivers followed the same pattern as previous years with inattentive driving; speed too fast for road or traffic conditions; driver lost control and did not have right of way, being the most frequently reported action of the driver involved.

In the age group 65 years or over, failure to yield right of way represented the improper driving action most commonly reported.

The next factor to consider is the condition of the driver and this is important because we have the question of condition involved in all accidents and fatal accidents. The factors are: apparently normal, 192,384, accidents, 88.1

per cent; ability impaired, 3,832 or 1.7 per cent; had been drinking, 13,334, 6.1 per cent; extreme fatigue, 777, .4 per cent; physical defect, 638, .3 per cent; not known, 7,426, 3.4 per cent, making a total of 218,391 accidents.

In fatal accidents you have: apparently normal, 1,219, 63 per cent; ability impaired, 45, 2.3 per cent; had been drinking, 266, 13.8 per cent; extreme fatigue, 14, .7 per cent; physical defect, 13, .7 per cent; not known, 374, 19.4 per cent, making a total of fatal accidents of 1,931.

They go on and say 91.5 per cent of the 218,391 drivers whose condition was classified by the police were "apparently normal". This includes those whose condition was "not known". For those involved in fatal accidents the corresponding future was 82.5 per cent. There were 228 more drivers classed as "ability impaired", and this is an increase of .2 per cent, and 1,685 more who "had been drinking", an increase of .1 per cent over the 1964 figures.

It is submitted to you gentlemen that the increase means nothing when one considers the increase in vehicle registrations between the two years in question. Further, the statistics do not consider those drivers who may have been drinking with a view to committing suicide by an automobile accident to collect on insurance life policies for the beneficiaries. It is noted that those whose condition was classified as "impaired" was made up mainly of the age group 25 to 44 years. In the case of those classified as "had been drinking", it was the age group 20 to 44 which made up the largest share. Personal problems must also be taken into account in assessing the driving ability of a person who is driving an automobile. One must also bear in mind the economic conditions which a person might be operating under which might cause them nervous strain which might also have a bearing in relation to the causation factor of an accident.

In relation to driver responsibility in accidents, it would appear that the younger drivers, 16 to 24 years and the older drivers, 65 years and over were more frequently at fault than the drivers in the age group 25 to 64 years. The drivers in the age group 45 to 54 years showed the lowest at fault rate again in 1965, with the greatest increases being shown in the age groups 16 to 19 years, 25.2 per cent and the 20 to 24 years, 11.4 percent.

Fatal accidents increased over all by 9.6 per cent from the 1964 total. Fatal accidents in Metropolitan Toronto showed a decrease of 6.5 per cent while the larger other urban areas showed increases. An increase of 8.2 per cent was recorded in fatal accidents in rural classifications, with those occurring on secondary roads showing the highest increase.

I am saying to you, gentlemen, that my submission is over and above what is quoted from this report because what I am quoting from these books which I have submitted to the Chairman as exhibits, I have so referred in my brief to you and noted the page number from which the quotation is taken or from which the statistic is taken.

In relation to the decrease in the fatalities in Metropolitan Toronto, one must bear in mind, I submit, that we have a situation there where we have crosswalks which could quite possibly have a bearing on the reduction in fatalities.

In dealing with fatally injured persons, of the 1,611 persons fatally injured in motor vehicle accidents, 619, 38.4 per cent, were motor vehicle drivers; 564, 35

per cent were passengers and 387, 24 per cent were pedestrians. These three classifications accounted for 92.8 per cent of all deaths reported in 1965.

It is suggested in considering the fatally injured figures one must bear in mind that automobiles could be constructed with certain additional safety features which could well help, it is submitted, to reduce the fatality ratio. One must also bear in mind the increase in the purchase of compacts.

A driver driving a compact has a greater risk of death in an accident than a driver driving a large car.

It would appear that in 1965, in relation to the total number of accidents, "ability impaired" in so far as condition of the driver is concerned totalled only 1.75 per cent and "had been drinking" the amount was 6.1 per cent. In the figures for 1964, "ability impaired" in so far as the condition of the driver is concerned, totalled 1.80 per cent and "had been drinking" the amount was 6.16 per cent. These figures, gentlemen, are based on the summary of motor vehicle traffic accident statistics referred to at the back of "Accident Facts for 1965" and the accident statistic figures for 1964 show that in all accidents there was a total number of drivers of 218,391 of which apparently normal were 192,384; ability impaired, 3,832, which amounts to the 1.75 per cent figure.

Mr. WOOLLIAMS: Are those charts pretty lengthy or could we have them part of the record.

Mr. BAZOS: They are very lengthy.

Mr. WOOLLIAMS: Would they be difficult to print, do you think, Mr. Chairman?

The CHAIRMAN: We can put them in as exhibits.

Mr. BAZOS: I was going to suggest, gentlemen, if possible, I might be able to obtain additional copies of these books from the Department of Transport and possibly forward a number of them here because I must say to you that my thinking in relation to the contributing factor of alcohol to the results of accidents and fatalities has been drastically altered as a result of consideration of these figures.

Mr. MCCLEAVE: May I ask you, can it be claimed that these figures are on the conservative side? These are only offenders who have been caught and there is an area there of great doubt. Do you think that these figures should be higher in the case of these drinking offences, drunk driving?

Mr. BAZOS: No, sir. These are the total accidents whether or not there were charges laid.

Mr. MATHER: Mr. Chairman, could I ask the witness a question. Is it his contention that alcohol is not a major factor in traffic accidents apart from fatalities?

Mr. BAZOS: Precisely.

Mr. MATHER: Is he aware of the findings of an impartial body such as the National Highway Safety Council which have figures not only for Canada but the United States. Their figures indicate that in approximately 45 per cent of all fatal traffic accidents, the drivers had consumed alcohol within a few hours prior to the accident?

Mr. BAZOS: I would like to see these statistics. I would like to study them. I am going on the statistics, as I say, that I gathered from the Metropolitan Toronto police department for the last five years which are on the first page of this memorandum and the figures from the Department of Transport for the province of Ontario. All of these statistics and figures to which I referred came from this booklet, "Accident Facts 1965".

Now, going to the 1964-65 report of the Minister of Transport for Ontario we find that the statistics reported on pages 23 to 27 of this report tell a story of continued growth in the use of highways which reflects the over-all economy of this province. The number of motor vehicles and trailers registered in 1964 increased by 4.8 per cent over 1963, making a total in excess of 2.5 million. One item of particular interest in the summary is the reduction in motorcycles of about 2,000 from 1954 to 1964. The smallest number of motorcycles registered since the war years was in 1962 and 1963 when about 7,000 were registered. This number increased in 1964 to 10,000 and the trend for 1965 indicates an increase in excess of 100 per cent.

The variety of purposes for which passenger type vehicles are now used is reflected by the increase of 133,000 or 739 per cent in dual-purpose vehicles. The following table dealing with the categories of passenger vehicles indicates a trend to the compact car and a preference for the eight cylinder motor by purchasers of regular size automobiles.

One should consider it is submitted, gentlemen, the deaths that occur as a result of the increase in the use of compact motor vehicles. I understand there are no statistics available on this at present.

At page 7 of the report the chart shows a sharp increase in motor vehicle registrations and a considerable drop in the fatal accidents, with a drop from the peak in so far as motor vehicle accidents are concerned.

Now, the interesting part of this chart shows that the peak year in fatal accidents per 100 million miles travelled appears to be in 1945 with a continued decrease each year and the lowest figure for fatal accidents per 100 million miles travelled in the province of Ontario was the last figure in 1964, which I respectfully suggest, gentlemen, belies any suggestion about increasing carnage on the highways or increasing deaths from any factor. I am suggesting to you gentlemen that the increase in mileage, the increase in motor vehicles registered—

Mr. MATHER: What page are you on now, sir?

Mr. BAZOS: I am reading from page 7, the statistic figure here which shows trends in motor vehicle registrations and motor vehicle accidents for Ontario.

At page 33 of the report there is noted for the years 1963 and 1964: driving while intoxicated, 1963, 702; 1964, 681. Ability impaired, 1963, 10,240; 1964, 10,580.

At page 42 of the report—

Mr. McCLEAVE: Before you go on, could you give that out of the total number of offences. I think that is the most interesting fact.

Mr. BAZOS: This goes for convictions, gentlemen, and all it provides is convictions. I do believe that the difficulty is when you are talking of convictions or rather the relation to fatalities, I think this is covered—

Mr. McCLEAVE: We would like the figures.

Mr. BAZOS: I did cite them to you personally before from page—

Mr. WOOLLIAMS: In other words, of 15,755 accidents or convictions in 1963, 702 were found guilty of driving while intoxicated?

Mr. BAZOS: The unfortunate problem—

Mr. WOOLLIAMS: The figure of 10,240 is for those driving while ability was impaired, and those driving while disqualified might have been impaired too. That figure is 2,456.

Mr. BAZOS: But what you are overlooking is that these figures include statistics in which no accidents occurred. Those figures, gentlemen, involve charges, all charges. The figures which I quoted previously from the statistics were the figures in relation to accidents and fatalities. As I understand the problem in discussion, it is a question of determining whether alcohol plays a predominant role in accidents and secondly whether alcohol plays a predominant role in fatalities.

Mr. WOOLLIAMS: Of course, we might be very thankful that the police caught him before he knocked somebody over.

Mr. BAZOS: If you will permit me to finish my submission to you, I will be pleased to debate or answer any questions that you might have to put to me.

Before proceeding any further, I would draw your attention to the fact that of the number of prosecutions in our area for impaired driving, the ratio of convictions is slightly over 90 per cent. The unfortunate part is that—and you might do something about this, since you are a member of the Committee—the Dominion Bureau of Statistics, in so far as showing the number of convictions and acquittals involving impaired driving is deficient. All it shows is the number of convictions. It would seem to me that if you are to keep accurate records or correlation records, you should show many people have been charged, how many people have been convicted and how many people have been acquitted. Just because a person has been charged with a drinking offence does not necessarily mean he is guilty. Just because a person has been drinking and charged with an offence does not necessarily mean that the drinking was a contributing factor to the accident because the situation could quite conceivably appear that the accident was caused by the actions of the other party. I am not saying that this applies in all instances, but I am suggesting to you that any statistic that you care to look at—these statistics which I have provided are statistics which I was able to garner in relation to total accidents. This is the criterion you should follow, not accidents upon which charges have been laid. You should consider the over-all number of accidents that have transpired.

The report of fatal accidents by type of collision discloses in 1963, at page 42, 1,222 deaths while you had a total motor vehicle registration of 2,268,320. In 1964 there was a slight reduction, 1,202 deaths, a total reduction of 20 deaths but the total motor vehicle registration was 2,381,219, an increase of almost 113,000 motor vehicle registrations. Yet you have a decrease of 22 deaths.

I respectfully suggest, gentlemen, that if you project your figures for the number of registrations, the amount of mileage travelled by automobile on our highways, you will note that the number of deaths that occur are drastically below the percentage figure that other people might lead you to believe.

In relation to drafting my remarks on this proposed Bill No. C-87, I would suggest to you gentlemen that first of all you should consider who are the people who are going to benefit if such a bill is enacted into law. I respectfully suggest to you that the first people who will benefit will be the automobile insurance companies, because under the statutory conditions of policies there is provided under clause 2, subsection (1):

The insured shall not drive or operate the automobile—

- (a) while under the influence of intoxicating liquor or drugs to such an extent as to be for the time being incapable of the proper control of the automobile.

I ask you to bear in mind what would happen if this bill was enacted into law in so far as the position of insurance companies is concerned to cancel these policies because someone refuses to consent to the giving of a breathalyzer test?

Secondly, I would suggest to you to consider that the next people who will benefit will be the police forces, because their job will be made extremely easy. The offence no longer depends on their going to court, making allegations of evidence, observations—all they have to do is take the man to a technician, force him to give the very evidence against him that will be used in a court of law to convict him and if he does not give it, if he refuses to give it, he should still be convicted of the offence of refusing to give evidence.

The next group that would be interested are the law enforcement bodies such as crown prosecutors or attorneys who, of course, will also be pleased to see such an amendment in the law.

Mr. WOOLLIAMS: It will be good for the defence counsel, though.

Mr. BAZOS: Well, that goes without saying. But in looking at this proposed bill, I can just see ways and means by which I would defend it if it should happen to be enacted. The difficulty of the police in attempting to enforce this law—I will have more to say about that when completing my comments and then by your asking any questions that might come to your mind, I think I can cover the points involved that you might have doubt about.

It is submitted that convictions are obtained in the Metropolitan Toronto area in at least 91 per cent of all prosecutions for impaired driving. Law enforcement is not prejudiced by the present law; for police departments if they wished could as in other jurisdictions take movies of an accused when he is arrested, or have a tape recording of his voice, both of which could be introduced in evidence at trial. I also submit, gentlemen, that the law as it presently stands is doing a good job.

As a member of the Canadian Bar Association, I have been adamantly opposed to any change in the law making a crime what is in essence a social problem, or a medical problem, not a criminal problem as some people would like to have it made out. By the way, what I forgot to mention as the last group that might be interested in seeing this law enacted, are those people who might have a desire to have drinking abolished or, as they like to call themselves, moderates, or have drinking restricted.

Mr. FULTON: What about the public?

Mr. MATHER: What about the drivers?

Mr. BAZOS: In relation to the Canadian Bar Association, gentlemen, there was a report dated February 19, 1965. The members of the committee were, His Honour Judge Harold W. Pope, the district judge of Moose Jaw, Saskatchewan; His Worship Magistrate S. Tupper Bigelow, Q.C., Toronto, Ontario; Walter C. Newman, Q.C., Winnipeg, Manitoba; A. Stewart McMorran, Q.C., city prosecutor, Vancouver, British Columbia; Hazen Hansard, Q.C., Montreal, P.Q.; John T. Weir, Q.C., Toronto, Ontario, and P. D. Isbister, Q.C., Toronto, Ontario.

With the exception of Mr. McMorran, who is a crown prosecutor, gentlemen, I am of the opinion that none of these persons named has been working members of the Criminal Justice Section of the Canadian Bar Association, and in any event have not been members of the Ontario subsection of the Criminal Justice Section which has been adamantly opposed to any change in the law in so far as breathalizers are concerned and have so been for the last two years.

Mr. WOOLLIAMS: What about E. C. Leslie, Q.C., former President of the Canadian Bar Association?

Mr. BAZOS: What has he to do with it. Is he a practising criminal lawyer? Is he a proponent of civil liberties?

Mr. WOOLLIAMS: Yes, he is both.

Mr. BAZOS: Well, we will see.

Mr. MCCLEAVE: And in Nova Scotia to boot, too, which makes him very sensible.

Mr. BAZOS: I do not know where that gentleman comes from. But be that as it may, I draw to your attention that the British Columbia subsection of the Canadian Bar Association also opposed this suggested change in the law.

In 1965, at the annual meeting of the Canadian Bar Association, this recommendation of this report, which was submitted to the Minister of Justice, was withdrawn by him. This year in Winnipeg there was a meeting of the Canadian Bar Association at which the approval of the people who voted at the open meeting was obtained. But I respectfully suggest, gentlemen, that this does not represent a true cross-section of the lawyers in Canada nor does it represent—in other words, these lawyers who voted in favour of this report, and this is what I am referring to now—

Mr. WOOLLIAMS: Are you suggesting they are insurance lawyers?

Mr. BASFORD: I do not know what they are, sir. All I am telling you, is, in my opinion, these members were not working members of the Criminal Justice Section. I do not know whether these gentlemen practice in magistrate's courts, as I have for many years. When I see the effects of people charged with impaired driving, the results that flow from convictions of impaired driving—

Mr. MCCLEAVE: Is that not a matter of correcting the law? The penalties are too harsh. I am not therefore saying that because a man is caught out and then fined because parliamentarians have set certain penalties, that this is all wrong.

Mr. BAZOS: I am sorry, sir, I cannot agree with that argument and if you will kindly defer it, I am nearly finished with this matter. I will then be pleased to debate with you any matter or question that you might wish to put to me.

In relation to this report of the Canadian Bar Association, I wish to respectfully draw your attention to the fact that at page 2 of this report it says as follows:

Your committee considering the existing legislation bearing in mind the principle that if it is not necessary to change it is necessary not to change.

It goes on to say:

The appalling statistics of accidents on the highways of Canada persuaded the committee that it is imperative that there may be a new legislative approach.

I respectfully suggest, gentlemen, this argument or this submission of appalling statistics on Canadian highways as a result of alcohol drinking drivers when one considers the total number of accidents, that if these figures from Ontario are to be believed, no one can question the fact that alcohol does not play a major role in accidents, not does it play a major role, I respectfully suggest, in fatality accidents.

Mr. McCLEAVE: Drive home carefully tonight if there has been a diplomatic reception in Ottawa.

Mr. BAZOS: I will be flying.

Mr. WOOLLIAMS: That is the trouble with many of them.

Mr. BAZOS: Now, gentlemen, the thing that also bothers me very gravely, if you enact this law, is that you will provide a person with a criminal record with all its ensuing consequences and I suggest this is a factor that you should take into consideration.

The subcommittee of the Criminal Justice Section in Ontario prepared a memorandum on the effect of a criminal record upon a person and I am not going to go into great detail, except I suggest to you that if a person is saddled with a criminal record—and this is not a misdemeanour. I understand in California there is legislation which makes it a misdemeanour. The equivalent I would suggest here would be a breach of a provincial statute such as they have in Saskatchewan and Nova Scotia. But it is not a crime in that sense.

Mr. McCLEAVE: Excuse me, this is not correct. The charges in Nova Scotia are laid under the Criminal Code, and not under the motor vehicle act. Mr. MacEwan and I can attest to that.

Mr. BAZOS: Well, gentlemen, my argument is directed to the point of not saddling a person with a criminal record because I feel if it is proven that alcohol has such a substantial effect in accidents, surely — and I am not satisfied that it has yet — the matter can be handled on a provincial level. Surely the appropriate province in relation to controlling the safety of the highways, and drivers, can enact legislation. If you give a man a criminal record just think the trouble he would have if he ever went to get a job involving bonding.

Mr. WOOLLIAMS: Or driving a Greyhound bus.

Mr. BAZOS: Or refusing to take a test.

Mr. WOOLLIAMS: You are talking about convictions?

Mr. BAZOS: Yes. This is what you would convict him of for refusing to take a test.

I submit to you gentlemen that if you give a person a criminal record, you must bear in mind the consequences that would follow if he should ever decide, for example, that he wants to go on a trip or he wants to emigrate, or he has to apply for a licence upon which he might have to disclose whether or not he has had any criminal convictions.

Mr. McCLEAVE: Or a job in the civil service of Canada.

Mr. BAZOS: Yes. This is why as I see it, gentlemen, the question of making it a crime is one thing but the ensuing consequences that flow from it must be gravely considered.

Now, I would also suggest to you gentlemen to consider that if this is enacted, it will subject any person on the highway to the whim of any police officer, whose nature could be at all capricious, to force a driver to submit to a test. Further, think of the magistrate or the presiding jurist. A jurist will not exercise any judgment in determining guilt or innocence of an accused person charged with this type of suggested offence, it is automatic; he is automatically guilty. There is no question of guilt or innocence. The guilt or innocence of the accused will be determined by a machine which I respectfully suggest is subject to variable factors, as outlined by Mr. Smith in the "Criminal Law Quarterly", volume 1, at page 39. It is under exhibit 8, which is drinking and driving, concerning tolerance, the fact the machine can be fooled if a person does not blow into it properly, considering the fact of the time lapse from the time the accident occurs until the time the breathalyzer test is taken. You overlook the possibility that a man could be sober, not be impaired at the time of driving, yet by the time he is required to give a test, the effects of the alcohol could have reacted upon him and he would be classified at that time as impaired. But you would not give him the protection of the fact that he at the time of driving was not impaired. Everyone is familiar I think with the progressive effects of alcohol. I am just suggesting this as an additional factor which might be considered.

In relation to this aspect of variable factors, I noted that in the submissions made by Dr. Ward Smith to your committee, he makes mention, at page 178, of the fact of charges already laid. In our area, what happens when a man is brought to the station? Sometimes the police officer will say to him, "you are under arrest"; sometimes the police officer will say, "come on to the station with me". When the accused is at the station, the police officer will do everything within his power to talk to him. If, for example, there is a factor which in the first place drew the arresting officer's attention to the motor vehicle, he might turn around and say to the suspect, "your tail light is out", and the suspect will get out of his vehicle and go behind the automobile and look at his tail light, which is in fact not out, but the police officer is carefully watching his movements.

When he goes to court the police officer might turn around and say the man was holding on to the car or maybe the man stumbled—there would be any number of factors over and above the question of the extent of alcohol consumption, if any, which could produce similar reactions.

When at the station the man is questioned by the police officer for a few moments, then he is turned over to an expert breathalyzer man. The function of

this breathalyzer man is to persuade in any way, shape or form, without the use of any coercive methods, which I do not think our police forces use in our area, but they use psychological tactics by saying to the accused, "now you would like to go home tonight, would you not? If you will just take this test, you can go home". The man one way or another is persuaded to take this test. That very test, as I say, will be used against him in court and does not provide, for what Dr. Ward Smith says and the British report says, namely that if you are going to involve people in these kind of tests, you should also provide them with clinical examination to rule out the possibility of any physical injuries.

We have had two deaths in Toronto in the last year of people who were mistakenly arrested as drunks, and locked up and they died.

Mr. WOOLLIAMS: You will admit that the breathalyzer test might have saved these people.

Mr. BAZOS: Well, how can you do anything if these people are semi-conscious or they cannot take the breathalyzer test because they are semi-conscious. You cannot put it to a person's face and make him take it if he is unconscious or next to unconscious. For example, a person is out and out drunk. Could you make an out and out drunk take a breathalyzer test? I doubt it.

I respectfully suggest, gentlemen, that in so far as practitioners in the field of criminal law are concerned, who are a defence counsel, I do not know of anyone who is in favour of this proposed amendment to the law. The only people I know that are counsel are crown prosecutors, as a rule, or other lawyers who are in other fields of law which fortunately or otherwise do not give them the opportunity to deal with the people who appear in court charged with these various offences.

I respectfully suggest to you that anyone who is involved in the question of civil liberties, because of the comment that I am going to make shortly, can believe in discretion. If you take a look at the Canadian Bill of Rights, gentlemen, you will see it says:

No law of Canada shall be construed or applied so as to authorize a court, tribunal, commission, board or other authority—

And I think the word "authority" can be construed as a police officer if you consider Section 15 of the Interpretation Act of Canada.

—to compel a person to give evidence if he is denied counsel, protection against self crimination or other constitutional safeguards.

Now, I have heard arguments addressed about the fact that incrimination is only restricted to verbal admissions. This might be so, but I have never heard in our jurisprudence where a man can be made to do something against his will and by doing this against his will he is damned if he does and damned if he does not. If this man takes the test—and it does not take too much alcohol to have the standard that is suggested in the act, and you must bear in mind that alcohol burns off at a fairly reasonable rate of speed. I am hoping you gentlemen will take time to read the articles which Dr. Smith submitted to you because there are certain items in there which will be of interest to you. I do not want to take time to refer to it but there is one aspect of it that I want to refer to definitely.

Mr. WOOLLIAMS: Just on that point, have you ever read the article based on this point in the medical legal journal of 1949 or 1950?

Mr. BAZOS: I cannot say I have. The thing is, gentlemen, Dr. Smith says in his article a person can drink. This is in Exhibit 8. In speaking about the rate of removal, of alcohol, he says this at the bottom of page 69. "A person tends to have the same rate of removal at a given alcohol level throughout a single drinking session. However, on another occasion he might have a different rate and there are wide differences between different people. This rate of removal can make a difference between a person who by spacing his drinks can drink half a bottle of whisky, 13 ounces a day, without exceeding a level of .05 and one who can drink two bottles, 50 ounces a day, without necessarily exceeding this level."

Now, you must bear in mind that this proposed amendment, if it is at all to be effective, if it is to be that the man is impaired the criterion is that he is impaired at the time of driving the automobile, and if the test is going to be made, it should be made almost at the time that he is caught and not wait for a lapse of an hour or maybe two hours, as the case might be, because the results differ. You could quite conceivably have the situation where a man is not impaired when he is driving the automobile and yet impaired subsequently.

I respectfully suggest that each individual has a different capacity as to driving and no person would be impaired if the figure suggested is .05. In our courts in Metropolitan Toronto the rough rule of thumb is that the border line is .15 per cent. Further, our courts consider breathalizers as corroborative evidence. You must consider whether or not a man is impaired, the physical characteristics of the driver, his experiences and his tolerance to alcohol, depending, for example, on how many years he has been drinking. The argument has been submitted that persons who will drive and drink will be reduced if such a law is passed. Respectfully I suggest it will not. I respectfully suggest that the man who will drink and drive will not be deterred and the closest analogy that I can submit to you is in areas where hanging has been abolished. There has been no drop in the death rate. Hanging has been proven not to be a deterrent.

Mr. McCLEAVE: At least there has been a drop in the death rate from hanging.

Mr. BAZOS: That is quite true, I will concede that.

Mr. WOOLLIAMS: Do you think that last statement is true about the record in Great Britain?

Mr. BAZOS: I have not seen any statistics yet upon which I would consider adequate conclusions could be drawn. You must bear in mind that in Great Britain, as I understand it, although I will admit that I am not as familiar with the law there as I would like to be, they also provide for medical examinations or clinical examinations of the person involved to rule out the question of any possible physical injury.

One of the things that I would like to provide to you, gentlemen, for your consideration is this. Assuming the person who conducts the test is a policeman or a qualified technician, if there is a mistake made, do you realize that there could be a suit brought for false arrest or malicious prosecution?

Mr. McCLEAVE: Those are very difficult cases to prove.

Mr. BAZOS: Not necessarily so. The question turns I concede, on the malice, but I also suggest to you that a person has the right to have immunity from arrest. A person also has the right to privacy, to lead his life in any manner, shape and form as long as he is not disturbing his neighbour. If he gets to the point that he is disturbing his neighbour, then the law should step into action.

If you look at the method that is contemplated, which I understand is the blowing into a balloon, you have what I consider to be a ludicrous situation. The test will be conducted by a technician who is a police employee.

I respectfully suggest to you that the statistics that I have referred to you do not at all substantiate the argument that alcohol causes carnage on our highways at all. If you will look at the figures, and take into account the total number of accidents involved, instead of the total number of breathalyzer tests administered, and I understand some of these figures were submitted by Dr. Ward Smith, I think that you will find the actual reason for the increase in deaths is the increasing number of motor vehicles which are presently using our highways and are causing enormous problems of traffic congestion in larger metropolitan areas.

Let not the age of the machine invade our courts of justice and deprive an accused person of the concept of law which has existed for many centuries that every man is innocent until he is proven guilty beyond a reasonable doubt. Let us not make of our courts a forum for forcing a man to give the very evidence which will be used to convict him against his will, and convicting him of a crime as well if he refuses to provide the evidence to convict himself of another crime. This would be contrary to all the principles of British justice and would be contrary to the principles of jurisprudence that have grown over the years in our Canadian courts. What I say to you gentlemen is do not give the evidence to convict him of a crime. This is the argument that I am putting to you. It is one thing that you might have a provincial matter. If you believe in the argument that to drive is a privilege and that the right of the province to control the highways and the issuance of licences, is within the exclusive jurisdiction of the highways people, surely they should be able to determine who should drive. The provinces should be able to enact the necessary legislation that is suggested should be enacted in this bill.

Mr. McCLEAVE: What about the section of the British North America Act which makes criminal behaviour a matter of federal jurisdiction.

Mr. BAZOS: Now, there is a point if you take the Lord's Day Alliance Act—at one time they used to think that drinking was such a heinous act that it endangered the population and the morals of the country. The act provided for a delegation of authority to certain provincial laws and as you say the question is, is this criminal legislation?

Mr. WOOLLIAMS: In Saskatchewan it is.

Mr. BAZOS: Well, I am submitting to you that it is not.

Mr. WOOLLIAMS: We have the Canada Evidence Act and the provincial evidence act. Both can legislate in matter of evidence, can they not?

Mr. BAZOS: Right. I say to you, what is the issue here to be considered, and is the issue a problem that has to be made a crime, or is the issue a matter that can be determined by a provincial enactment if you feel it necessary to be done?

I say to you gentlemen, in conclusion, that we should spend our time in a more constructive fashion to advance the dignity of man, to protect the rights of man, rather than make a crime of something from which tragic consequences could flow of which the average citizen of this country is totally unaware, if this bill is enacted into law.

I may say to you, a few years ago I happened to be listening one night, while I was in bed, to an open air program from a Hamilton station. As it turned out, they were discussing the question of breathalizers. Over a period of almost two hours there was not one person who phoned into that radio station who was in favour of compulsory breathalizers, not one. I suggest to you that we have a situation here in which one would think a very subtle form of brainwashing has been attempted by certain vested interests.

Mr. McCLEAVE: You are saying Mr. Mather supports vested interests?

Mr. BAZOS: I do not know anything about Mr. Mather's outside interests. I am not suggesting anything at all. If this matter is that important—and I do not think that anyone will question that it is—why should this bill not be emblazoned in the newspapers across the country and let the average citizen find out what he is actually letting himself in for.

Mr. McCLEAVE: Mr. Chairman, we cannot tell whether or not the witness has come to the end of his brief, but I gather that he is now attending on various opinions. I think we should have the right to question him.

Mr. BAZOS: One statement, that is all. I say this to you. Why do you not take this bill out of this Committee, draw it to the attention of the public, solicit, if you would, the opinions of the average individual and if the average individual says to you, your constituents say to you, "we think you should pass this law or we think that this is a proper law to be made a crime," then recommend that it should be made a crime. If the figures which I have submitted to you—and I have no doubt about the accuracy of them—I say to you that someone is at fault here and I say that the true state of affairs in so far as accidents, deaths and property damage, as a result of alcohol are a contributing factor, have not been properly and fully put forth to you.

Mr. McCLEAVE: Mr. Chairman, we have a reporter here from the Canadian Press who is reporting the doings of this Committee across Canada. I remind the witness that we have a job to govern; people have elected us to play our part in the government of this country. The suggestion to throw it open to referendum or public opinion in some way strikes me as utterly false. If we make a mistake in our judgment here our voters will be the first to let us know by seeing that the next time you appear on parliament hill we are not here.

Mr. BAZOS: Did you hear my remarks, sir? Instead of misquoting me, I said consult your constituents. I did not say anything at all about a referendum.

The CHAIRMAN: What you are suggesting, Mr. Bazos, is entirely beyond our terms of reference. Our function is to consider a bill which has been debated in the house, obtain evidence and report back our views in respect of it.

May I take it that your presentation is completed? You are now ready for questions?

Mr. BAZOS: Yes.

The CHAIRMAN: Before opening the meeting for questions, may I have a motion that the submission and exhibits by Mr. Bazos be appended to today's proceedings. Is it agreed?

Agreed.

Mr. Bazos, the meeting is open for questions.

Mr. WOOLLIAMS: I would like to ask a few questions. I know it is Mr. Mather's bill, but I have a few leading questions which I think might just lay the foundation.

Now, I would like to ask this question. The question of a breathalyzer goes to the evidence as to a man's acquittal or conviction. Is that not what we are considering today? It is a matter of evidence.

Mr. BAZOS: Did you say the use?

Mr. WOOLLIAMS: Yes, the use of a breathalyzer is really a question of evidence. Boiling it down—you have a lot of statistics and some of them I was very interested in, and of course we can all produce certain statistics. But to get down to some guide lines why we are here, it really is a question of evidence whether this is the right method or evidence we should use in a court of law. That is really what we are talking about, is it not?

Mr. BAZOS: Not quite.

Mr. WOOLLIAMS: Is that not the point of it, sir?

Mr. BAZOS: I respectfully suggest it is whether you will compel a person to do something against his will.

Mr. WOOLLIAMS: But it is a question of evidence, is it not?

Mr. BAZOS: No, sir; partly.

Mr. WOOLLIAMS: Well, what part is not?

Mr. BAZOS: Can you show me—

Mr. WOOLLIAMS: Just answer the question, what part is not evidence?

Mr. BAZOS: What you are putting to me is a sophisticated question because you are using the term "evidence" in a generic sense.

Mr. WOOLLIAMS: I am using it in a legal sense.

Mr. BAZOS: What you are suggesting is you are trying to boil it down to a *fait accompli*; that this bill will be passed and the end result of it is that it would be used in a court of law as evidence.

Mr. WOOLLIAMS: Mr. Chairman, just so the witness will appreciate what some of our vocations are as far as members of the Committee, I am a lawyer. I might tell you this, and I only say this in a way to get some idea what I am asking. I have been practising about 22 or 23 years; in the early part of my practice I defended many people on impaired driving. I was very interested in your brief and I can see that it was presented as a true defence counsel—and that is no disrespect to you. A good many things you said in your brief in reference to the infringement of our civil rights, I would agree with, but I would like to get down to a few guide lines in our argument on the bill. That is why I ask you this. It is a question today whether we should use this breathalyzer as some form of evidence in a court of law before a magistrate or in some other court? Is that not correct?

Mr. BAZOS: That is one of the questions, yes.

Mr. WOOLLIAMS: Yes. Do you think that the breathalyzer is as good as a blood test; is it as accurate?

Mr. BAZOS: I am not an expert, but from the little I have read I understand Dr. Rabonovitch has used one way, Dr. Ward Smith has used another way. From my own personal knowledge, the breathalyzer works relatively well.

Mr. WOOLLIAMS: I might say that in Sweden they have the blood test. Some of the experts say that in the blood test you are so liable to have a judicial error. With the breathalyzer test, if you had a meal or certain bodily conditions, it may not be as accurate as the blood test. But you are not able to pass an opinion on that?

Mr. BAZOS: If a man takes a meal, all it would do is delay the ingestion of alcohol into the system. Now, I do not pretend to be an expert. I think the Committee no doubt will obtain views.

I may say that there is some argument. I noted in the exploratory notes of Bill No. C-87 something about the fact that compulsory blood tests would constitute an unwarranted and unjustified trespass of a person.

Mr. WOOLLIAMS: Would you say whether there would be much difference between the invasion, referring to what you just said, of the blood test and the breathalyzer?

The point I want to make is this. I take it that you as a citizen, apart from being a lawyer—if a man has according to the law done something in which it is a matter of evidence whether he be convicted or not but if he has done something contrary to the law as a citizen of the country you would expect him to be brought before a court and convicted.

Mr. BAZOS: No. I say he should get a fair trial.

Mr. WOOLLIAMS: Let me just finish there. I want to make sure what your evidence is, because this I think would go to the credibility and your ability to sell us an idea. Are you saying then, that you are against a system where an individual has broken the law and the court of law has found him guilty of breaking that law, that you are against that conviction?

Mr. BAZOS: I do not understand your question.

Mr. WOOLLIAMS: Well, basically it is this. Are you against a person being found guilty if he has broken the law?

Mr. BAZOS: If a person is legally found guilty by a court properly constituted and by protection of his rights that the law affords him, no one is against it, least of all myself. The law is made to be obeyed and no one is above it.

Mr. WOOLLIAMS: Do you think that the best evidence should be produced at a court of law to come to that conclusion?

Mr. BAZOS: In relation to what sort of charge?

Mr. WOOLLIAMS: Any charge. Drunk driving, intoxication, murder, any charge you want to mention. The best evidence should be there.

Mr. BAZOS: Yes, I will concede that as a general principle. I know what you are leading to. Go ahead.

Mr. WOOLLIAMS: That is the trouble with lawyers. I will be awful nice to you, sir, but lawyers make poor witnesses and sometimes they are not too good at cross-examining either. But let us come back.

An hon. MEMBER: Speak for yourself.

Mr. WOOLLIAMS: Do you feel that police evidence, and you must have heard it because you have defended many cases I take it on this subject because you are an expert—

Mr. BAZOS: I do not consider myself as an expert.

Mr. WOOLLIAMS: —but when a policeman gets up and uses the old method, the 3-F method, slurs his words, he stammers and he staggers and often the magistrate accepts that as the best effort that the person in question is impaired. Do you think that kind of evidence would be as good as scientific test determining the amount and content of alcohol in the bloodstream of a human being?

Mr. BAZOS: Are you using that as a contrasting evidence, because as I understand the law, the use of breathalizers today is corroborative evidence. If the evidence of the police officer is uncontradicted the magistrate may accept and make the finding of guilty; if the accused gives evidence or has other witnesses, then you become involved in the question of whom the magistrate is to believe with the various questions applicable; but this is the function of the magistrate and if you put this machine in you will take away the judicial discretion which the magistrate exercises. You will make a machine determine the guilt or innocence of a person. You will make a machine which is subject to foibles of any decent machine to determine guilt.

Mr. WOOLLIAMS: Let me put this to you. If that machine, you might call it a machine either by blood test or breathalizer, is accurate, then is there anything wrong with the magistrate or a judge exercising that judicial discretion on the best evidence?

Mr. BAZOS: What is your question based upon, on the old law or on this law?

Mr. WOOLLIAMS: On the old law.

Mr. BAZOS: If the machine is accurate, and that is your premise.

Mr. WOOLLIAMS: Yes.

Mr. BAZOS: If the machine is accurate, and if the accused voluntarily consents to give that evidence.

Mr. WOOLLIAMS: Well, I appreciate that. I am taking all those things into account.

Mr. BAZOS: Well, nobody will argue with you about the accuracy of this machine, if it is so accurate, if that is what you are leading up to.

Mr. WOOLLIAMS: Well, you wait and see what I am leading up to. If you answer the questions instead of drawing inferences, you would be much more helpful to me and maybe to the Committee.

The CHAIRMAN: We are short of time.

Mr. McCLEAVE: Yes, but if you fellows would come out of that corner, and do-si-dos in the centre of the ring.

Mr. WOOLLIAMS: Well, I will not take much more time. I am going to ask one or two more questions. If a person was charged with impaired driving or drunk driving and was not intoxicated, would not the test of a breathalizer or a

blood test be the kind of test that would protect the accused rather than destroy him?

Mr. BAZOS: That is the argument that is propounded by police authorities.

Mr. WOOLLIAMS: Would you agree with that argument?

Mr. BAZOS: Yes, certainly. Of course, I agree with it.

Mr. WOOLLIAMS: Then, at least, apart from the terms and conditions of the bill, taking the breathalyzer whether you use it as corroborative evidence or use it as the evidence, the best evidence, or the blood test, it can be said that these tests, although they may be an infringement on the civil rights, and we have lots of acts that do certainly infringe on the civil rights of people, could be used as a protection of the individual rather than evidence against him in many cases?

Mr. BAZOS: Well, let us qualify your question because I am not so much caring about the civil rights. I am caring about the rights of criminal law, the right and the presumption of innocence of an accused. What you are going to do to me is bring in the fact, and there is no way that you can break away from it—what you are trying to do is say to me, I will concede everything you say as being correct but you cannot get away from the very point that what you are trying to do is make a man convict himself.

Mr. WOOLLIAMS: Yes, but you have already admitted, or maybe I misunderstood you, that if a person is charged with an offence and the best evidence is produced in court, and the court judges on that evidence, and the person is convicted, you say that if anybody is convicted in that manner that you go along with it; that he is properly convicted. You have agreed with that, have you not?

Mr. BAZOS: Your argument is based on the assumption that that evidence was consented to by the accused. This is where we part company because I am maintaining the position that the accused does not consent to the giving of this evidence. He does not consent to the administration of a breathalyzer. Your whole argument is premised on the assumption that the accused consented to this or there is a statutory obligation. My argument is that no man should be obliged in this country to submit to a breathalyzer.

Mr. WOOLLIAMS: In other words, what you are saying—

Mr. BAZOS: To make it a crime.

Mr. WOOLLIAMS: Yes, just a moment now. What you are really saying, and I might go along with you in this regard, that no one should be forced to confess either by words, deeds or actions or by scientific equipment of an offence. That is your point.

Mr. BAZOS: That is right.

Mr. WOOLLIAMS: That is your full point you have made this afternoon.

Mr. BAZOS: My full point is also that statistics prove, and contrary, with all due respect, to the allegation you made concerning the fact that I submitted this brief as a defence counsel, if you read my brief, you will note that my notes show both sides of the coin. My notes show the accidents and fatalities, both ways, property damage and fatalities, and all I say to you, sir is that you read these books and if your thinking is still the same, that alcohol is a major con-

tributing factor to fatalities of a major nature, and also in property damage collisions, as I told you before, from the summary of motor vehicles statistics, and I do not care who looks at them, you cannot escape the fact that these are as comprehensive figures as I have ever seen. You cannot cut them, and I challenge anyone's statistics, highway traffic council or anybody's statistics because I say they are based on misinformation if they allege anything that is contrary to these statistics which are put out by the Department of Transport for the province of Ontario, and the statistics of the Metropolitan Toronto Police Department. I say to you—all right I will leave it at that.

Mr. WOOLLIAMS: Just one more question. I have practically come to the guidelines that I wanted you to. One statement that you made was that you felt it would help the insurance companies. If you can cut down the accident rate surely that cuts down the cost of insurance, and therefore, the cost of the premiums and it will be reflected upon the cost of insurance to the general public.

Mr. BAZOS: Sir, your question, if I may respectfully suggest, is based on a generalization, if you are familiar at all with accidents. The accidents between the 16-year olds and the 19-year olds are a greater factor; in fact, the accident premium for people from 16 to 19 years of age, and 19 to 21 is much higher than for a more mature driver.

Mr. WOOLLIAMS: Mr. Chairman, I probably have many questions but I know that it is Mr. Mather's bill and I would like to turn over the questions to him if he wants to use the opportunity.

The CHAIRMAN: Do you want to defer to Mr. Mather, because you had your hand up first, Mr. McCleave?

Mr. McCLEAVE: I have only one question, Mr. Chairman, and before I ask it from this corner, our witness has met a great number of questions during the delivery of his brief, I will not apologize for that part, although I must say he seems to have the fixity of purpose of an Old Testament prophet. But the witness I think has made a very compelling point against people, under our system of law, being compelled to hang themselves, as it were, so I ask the witness this. Section 223(2) of Mr. Mather's bill reads "Where a law enforcement officer has reasonable and probable grounds for believing that a person has committed an offence provided for in Section 222, he may require the said person to give a sample of breath". Would he have his objections met by putting in after the words "believing" either "and has given a warning" or "has made a statement to the person setting forth the reasons for which he is asking that this test be applied". For example, the officer could come up and either give the warning or he could say, "Mr. Driver, for the last mile I have followed you and your car has weaved all over the road, and I have a suspicion that your ability to drive is impaired and I therefore, ask that you give consent to a breathalyzer test." Supposing he put in either one of those two riders, the warning or the requirement that the police officer state to the possible accused on what grounds he is asking for that test, would either one meet your objections?

Mr. BAZOS: I do not think it would add anything to the words "reasonable and probable grounds" because if the peace officer has reasonable and probable grounds he has the right without considering the rights of the suspect to do what he as a police officer wants. By adding the one, you said a warning.

Mr. McCLEAVE: A warning.

Mr. BAZOS: And the second one was a requirement explaining to him—

Mr. McCLEAVE: A statement on what grounds he bases his reasonable and probable grounds of belief. Let me put this forward to you.

I want to recall an earlier part of your testimony before us this afternoon where you said you were afraid of the capricious acts of a police officer who would come along and bring a man before a breathalyzer machine for any or no reason at all. Here I am giving you a solution, a way out. The police officer has to make his point before he can ask the possible accused to go along. Does that not solve your problem, sir?

Mr. BAZOS: No, I do not see how it would. May I suggest that you follow it through for the moment and see what would happen. In the first place, I submit that it would be superfluous because in relation to the determination of the decision on the part of the police officer to have the man submit to test by the addition of the warning or the setting out of the requirement, it would not alter the police officer's viewpoint. It would not alter the possible position of the guilt or innocence of the accused because he still is not free.

Mr. McCLEAVE: I grant all those points, but what about vis-à-vis the accused so that he knows where he is standing.

Mr. BAZOS: Well, from that point of view—

Mr. McCLEAVE: This is the point I am trying to make, that it can be brought home to the accused what he is in jeopardy of and he may very well say, "Sir, I refuse to take the breathalyzer test".

Mr. BAZOS: If he refuses to take the breathalyzer test, as I interpret section 224, he is guilty of an offence.

Mr. McCLEAVE: Well, I hope we can persuade Mr. Mather to cast that one out because I think that is very bad law indeed.

The CHAIRMAN: May I interrupt now. I have to leave now, to be in the house and I would ask Mr. Forest if he will take the chair. I know that there are more questions from Mr. Mather and probably others. Is that agreeable?

Agreed.

The VICE CHAIRMAN: Mr. McCleave, do you have a further question?

Mr. McCLEAVE: No, thank you very much, Mr. Chairman, I think I have made my argument and the witness has given me his opinion.

Mr. BAZOS: May I add something since I understand now what you are driving at. You are suggesting that by the man giving the warning, if the accused refuses, he would not be guilty of any offence.

Mr. McCLEAVE: Oh, no, I am not saying that; he would not be guilty of the offence of refusing to submit to a breathalyzer test. He could still be arrested by the police officer who would use the traditional methods now used in court either to bring a conviction or an acquittal.

Mr. BAZOS: Of impaired driving.

Mr. McCLEAVE: —of impaired driving, yes.

Mr. BAZOS: What would happen, may I ask, if this warning was given? Can this evidence of the refusal, assuming that there is a charge of impaired driving, be used against the accused?

Mr. McCLEAVE: The same law would apply in that case, I suggest, sir, as would apply in any case where warning is given and the accused stands mute. You cannot bring that—

Mr. BAZOS: I am going forth, as I understand any proposed suggestions as to amendments or revisions.

Mr. WOOLLIAMS: But there is one point, Mr. Chairman. Take a murder case where you have a confession. You may have an illegal confession but as a result of that confession he shows you where the instrument was used to kill the person in question. The confession is ruled out but as part of the *res gestae* the rifle goes in. I have had one of those cases. So what he is really driving at is that the question might be that through duress the man was asked to take a breathalyzer test or a blood test. That might be ruled out but some fact or some other element could be ruled in which could be used as corroborative evidence against him.

Mr. McCLEAVE: Yes, he might say I had only four drinks of Aunt Minnie's old parsnip wine. And down they go to see Aunt Minnie and that is the end of the case.

Mr. WOOLLIAMS: Just before we turn the questions over, it is five minutes to six o'clock, and maybe some of us have quite a few questions to ask. Are we going to proceed tomorrow with this witness?

The VICE CHAIRMAN: If we could impose on him to stay over, or if we could wind up the questioning. I think Mr. Mather who is the proposer of this bill should have a chance to ask a few questions.

Mr. BAZOS: If it would be of any assistance, Mr. Chairman, I strongly believe in the figures I have submitted to you concerning statistics. If at all, I can be of assistance to the Committee, I am motivated primarily in my desire to see if possible that this bill does not pass, and if by staying over for another day additional questions may be asked of me, I am in the hands of the Committee.

The VICE CHAIRMAN: We thank you for this offer but I believe Mr. Mather is the last on the list. I understand committees are not sitting on Friday. If need be we would call on you back if it is agreeable, but maybe we could wind up the questioning by having Mr. Mather ask his questions now, and we could go on for a few minutes longer if necessary.

Mr. MATHER: If it is agreeable to the Committee, I am one of the few non-lawyers represented here, not entirely because of that fact but perhaps my questions will be shorter than some have been previously. I have only about three or four questions.

Mr. WOOLLIAMS: Perhaps the witness will appreciate a layman's cross-examining better. He resisted us a little.

Mr. MATHER: I hope it will be better.

The VICE CHAIRMAN: I was trying to close off a few moments before and will follow your questions with trepidation.

Mr. MATHER: Mr. Chairman, the witness has agreed that his contention is that alcohol is not really a major factor in auto accident fatalities. He has

presented figures to support that point of view. That contention and the figures are almost at entire variance with other contentions and figures we have had from impartial people before him. However, skip that for the present time.

I think I am right in saying that the witness believes that drinking and driving is really a medical problem, as much as if not more so than a legal problem. Is that so?

Mr. BAZOS: Dealing first of all with your first contention, I am not submitting figures to you. I am submitting reasons as given by a government department.

An hon. MEMBER: We were doing the same thing.

Mr. BAZOS: Well, sir, I have not seen them. I have made a search, I may add, for additional records and information that you speak of, and these were the only statistics that I could find. The statistics from the Dominion Bureau of Statistics would not lead to anything so far as I am concerned in helping me submit any additional information to you. These figures are not something that I dreamed up out of a hat. These figures are substantiated by statements prepared by the government and, frankly, I have no reason to suspect them. They seem to correlate percentagewise with the Metropolitan Toronto figures, and until such time as I see something to the contrary, I am prepared to accept these figures for what they are. I am sorry, sir, I missed the second part of your question.

Mr. MATHER: The second point that I raised was that I thought I was right in saying that you believed the problem of drinking and driving is a medical one as much as or perhaps more than a police or legal one.

Mr. BAZOS: Medical or social, sir.

Mr. MATHER: On that point, I wonder if you are aware that the subject matter of this bill is supported by the Canadian Medical Association and also that the British Medical Association supports very similar legislation in Britain.

Mr. BAZOS: All I can say to that, sir, is that they are not lawyers. They are not aware of the ensuing consequences that would flow if this bill was enacted into law.

Mr. MATHER: You have said you were aware of the fact that the Canadian Bar Association has gone on record as supporting this type of legislation. I know that you do not agree with them but you are aware of the fact that the lawyers in number have gone on record as supporting it.

Mr. BAZOS: May I suggest that what has gone on record is the council of the Canadian Bar Association this year. In 1965, the membership forced a withdrawal of the bill from the Department of Justice. The criminal justice section of Ontario for two years running have been adamantly opposed to compulsory breathalizers, making it a crime, that is. The question whether it should be left open for a regulatory matter on a provincial basis has not been decided upon because we were not unanimous on that aspect. But we were unanimous in the fact that we did not wish to see compulsory breathalizers made a crime. As I understand it, and speaking to Mr. Sam Toy who was the chairman of the committee in British Columbia in 1965, he, too, and his group, were also adamantly opposed to compulsory breathalizers.

What happened this year—and I can refer to the proceedings of the Canadian Bar Association for the previous year when the matter of a resolution

was that it was to be reported to the various subsections and then they were to report back. What happened was that they sidetracked it this year.

The resolution, and I am quoting now from the proceedings of the Canadian Bar Association, Volume 48, 1965, as to the amendment, because there was some question as to what actually happened; the resolution from the civil liberties section was that the recommendation of council to the Minister of Justice on behalf of the Association be withdrawn. The amendment was to the same effect that the recommendation be withdrawn and that the matter be referred for further study to the appropriate sections and subsections, at the next annual meeting, for further discussion by our various subsections and presumably reports from them will come in at the next annual meeting. Now, going on with that.

Mr. WOOLLIAMS: What date is that?

Mr. BAZOS: This was at the annual meeting in 1965, when the report was withdrawn which the council had passed and submitted to the Minister of Justice without submitting it to the membership at large.

What happened this year was that I went to Winnipeg to the meetings and it was not discussed through the various sections and subsections in the way that the constitution provides that it should be brought up. Instead they put it on the agenda for an open discussion on Tuesday. None of the lawyers were there that were concerned in reality about this problem. I say to you that any recommendation of Canadian Bar Association meetings that purports to speak for all the Canadian lawyers that are members thereof, is not correct. In my view it is the saving of face of the council of the Canadian Bar Association because they whip-sawed through this report, bearing in mind that they, too, I respectfully suggest, were confused by the appalling statistics on highways, the casualty drinking driver problem.

Mr. MATHER: Mr. Chairman, it seems that the witness, as with his figures which are at variance with the major authorities, so with his feeling about the Canadian Bar Association; the fact remains that whether he likes it or not the bar association is tomorrow presenting an argument to the Justice Department in favour of this type of legislation.

Mr. BAZOS: Tomorrow, sir?

The VICE CHAIRMAN: They will appear next Tuesday.

Mr. MATHER: Not here, but they are meeting with the Justice Department.

The VICE CHAIRMAN: I just wanted to mention that representatives of the Canadian Bar Association will be here next Tuesday morning.

Mr. MATHER: That is right, but as I understand it, in the meantime they have a delegation to meet with the Justice Department in line with the decision in Winnipeg.

Mr. Chairman, the witness has said that, aside from the fact that he believes at least, that alcohol is not a major factor in traffic deaths and that he disputes the decision by the bar association at Winnipeg, in some way this legislation that I propose would interfere with civil rights or civil liberties. In that line he has quoted the Canadian Bill of Rights and I want to ask him if he is aware of the fact that a very notable supporter of the Canadian Bill of Rights, in fact, the

main author, Mr. Diefenbaker, at page 4401 of *Hansard* has this to say about this type of legislation.

"I am not going into the chemical arguments now although I am in a position to do so. There are those who will say that it means some invasion of liberty. Looking at it from the point of view of one who, with few exceptions, has invariably been engaged on the defence side, my answer is that I do not believe any questions of liberties of the subject arises of the person who has been in an accident which was obviously due to his negligence and who apparently is under the influence of liquor is asked to breath into a balloon with the view of determining once and for all the question whether or not the degree of his intoxication was such as made it dangerous for him to be on the highway."

I do not know if he was aware of that statement but I put that on the record in relation to the assertion that this type of legislation would be contrary to the Canadian Bill of Rights.

Mr. WOOLLIAMS: May I just speak to that a moment, Mr. Chairman. The Canadian Bill of Rights is mainly an act of parliament. It was not a constitutional change, and if an act of parliament spells out that it is going to exempt that act from the Bill of Rights, you can change it like that. That is one of its great weaknesses, because unless you have the provinces consent, and we had evidence given at that time to the Bill of Rights itself, it would never be a constitutional change. Therein lies the weakness of the Bill of Rights.

This act is saying this act will exempt it from the Bill of Rights, and then it will be outside of the Bill of Rights, and that is always what we have to guard as parliamentarians.

Mr. MATHER: I do not know if I am in order in asking Mr. Woolliams a question but if I am it is this. Would he not agree that Mr. Diefenbaker is a noted defendant of civil rights and liberties?

Mr. WOOLLIAMS: I certainly would.

Mr. MATHER: Would he not agree from what I have quoted, from what he said, that he supports this type of legislation?

Mr. WOOLLIAMS: I would not like to speak for him. That is one thing I have not tried to do.

Mr. MATHER: I think that his words are reported here from *Hansard*.

Mr. WOOLLIAMS: He probably did take that position. There again there is a reason why he took that position.

Mr. MATHER: I want to ask the witness what he would consider—

The VICE CHAIRMAN: Sir, this first question about civil rights—

Mr. BAZOS: I would appreciate very much if Mr. Diefenbaker was made aware of the statistical figures and the percentages that have been outlined here in these government figures. One must bear in mind that a man of his stature and no doubt extremely busy schedule, might not have had the opportunity yet to sit down and weigh the full consequences and implications of this bill until he has seen the benefit of this Committee's deliberations and I think that to attribute a statement of a leader of a party, either of the Liberal, Conservative or New Democratic or Social Credit, or any other parties, if I have omitted names

inadvertently, my apologies. Creditistes, I did not know how to pronounce it correctly and I did not wish to make an error. I think that is the duty of this Committee, and I am certain the Committee will look into the matter completely.

All I am suggesting, sir, is that I am presenting to you the views, the figures that I have acquired and my opinions. Mine are one person's opinion. I am not at all suggesting to you that my opinions are the correct views. I am only saying to you that the opinions I have expressed here today are my own personal views, based on my own experiences, based upon my own research. That is as far as I can go.

Mr. MATHER: I have one more question, Mr. Chairman. In relation to what has been said about the possible interference with the legal rights of the suspect in regard to the giving of evidence, I wanted to ask the witness if he would comment on this very brief statement of Mr. Justice E. L. Haines of Ontario, who says:

"Today a motorist must identify himself by producing his operator's licence, produce evidence of ownership of the vehicle so that all may know if it is stolen, prove his financial responsibility, permit a mechanical inspection of the vehicle as to its fitness, report any accident involving personal injury or property damage over \$100. He must remain at the scene of an accident and he must offer assistance to the injured. These are all exceptions to the so-called right to remain silent, and they were created in the interest of public safety. Identity of the driver and owner, proof of financial responsibility, safety of the vehicle, these are secondary compared to the physical fitness of the driver. Why should we not take the step to ensure true disclosure of that fitness when it has been affected by alcohol?"

I wonder if the witness would comment on that statement.

Mr. BAZOS: What was the first line of that quotation, sir?

Mr. MATHER: Today a motorist must identify himself by producing his operator's licence, produce evidence of ownership of the vehicle so that all may know if it is stolen, or if it is not stolen. He must prove his financial responsibility and he must permit the mechanical inspection of the vehicle as to its fitness.

Mr. BAZOS: Yes.

Mr. MATHER: Report any accident.

Mr. BAZOS: My understanding, and I am subject to correction by you, Mr. Woolliams, is that there is an obligation under the law to make a statement as to who is the driver of an automobile but in a criminal prosecution, if any evidence is to be adduced against the man over and above this, there has to be a *voir dire* to determine whether this statement can be construed as free and voluntary under the law.

Mr. WOOLLIAMS: What you are saying is, and I agree with it, what is right under a quasi criminal offence under the Vehicles Act and what is right under the Criminal Code are two different and distinct things and the evidence can be differentiated.

Mr. BAZOS: This is the point at issue here you are giving a man a burden: the law protects ordinarily the evidence to be given in a quasi criminal offence which is a breach of a provincial law and gives the courts the right to determine by what is called a *voir dire* which is a trial within a trial the admissibility of

any additional statements made by a man which could be construed as of an incriminatory nature. The thing that bothers me very greatly about this, sir, is that the law has acknowledged for years that a man may not be required to give a statement. There has been a differentiation between voluntary statements as being involved in the question of self-incrimination, but the taking of a breath tests as not being incriminatory because it is not verbal, and I think that distinction is highly fallacious because what is the effect of giving the breathalyzer is that it will incriminate the man. It will give the very evidence to convict him.

An hon. MEMBER: In many cases it does the very opposite.

Mr. BAZOS: No, sir, I respectfully suggest that it does not because if you stop to reason for a moment, what are the factors which require a police officer to stop a suspect except that there is something about the automobile or the driver which renders him, the driver, suspect. It arouses the suspicions of the police officer. I have figures here for Ontario, 1965, and it would appear that in only 9 per cent of the tests, no charge was laid. I am referring now to the fourth page of the statistics from Exhibit No. 6; this is for the year 1965. For the year 1964, no charge was laid in 11.2 per cent of the tests; in 1963, 10.5 per cent of the tests; in 1962, 11.2 per cent of the tests; and in 1961, 10.4 per cent of the tests.

I respectfully suggest to you, sir, that in these tests—I would assume, of course, the bona fides of the arresting police officer, on the police officer that brought the man in for the test—he had reasonable and probable grounds to warrant having requested the man to submit to a test. In only a minute percentage of these cases, was the test favourable, the figures are in the neighbourhood of 10 per cent, and surely, sir, the figures of 10 per cent indicate a peculiar amount of correlation when one views it with the purpose behind the breathalyzer which is to get evidence.

Mr. MATHER: My idea would be that when the machine finds 10 per cent of the suspects not guilty or not impaired, it substantiates my contention that the machine is an impartial and honest machine.

Mr. BAZOS: No, sir.

Mr. MATHER: My contention is that even the figure of 10 or 11 per cent in cases where a man is suspected of impairment and being questioned as you suggested, would indicate the impartiality and scientificness of the machine. Because as you have suggested, there must be some reason for his being suspected and in at least 10 per cent of the cases, using the machine, he is freed from that suspicion which he might not otherwise be by the verbal or physical evidence.

Mr. McCLEAVE: I think the witness has already stated the type of operation used in marginal cases by the policeman so, obviously, Mr. Mather has made the correct point. Sometimes the machine would get the man, and the other times it would send him out free.

Mr. MATHER: One final question this time, sir. I wonder if the witness is aware of the fact that in the United States there are now 40 states with this type or similar type of legislation that is, including those who have implied consent laws? "Implied consent laws" means that when you go to get a motor licence you

imply your consent to drive safely to the extent of submitting to a test of this type.

Mr. BAZOS: Well, that is in a sense a provincial law. A state law in the United States is what is classified as a misdemeanour. It is not a felony. It is not a breach of a federal statute. What you're planning here sir, is a breach of a federal statute. In the United States these breathalizers, in these states that you are talking about, sir, they do not make it a crime.

Mr. McCLEAVE: Excuse me, is it not a fact though that the criminal law in the United States is a state responsibility and not a federal responsibility, as distinct from the situation in Canada?

Mr. BAZOS: The question of determining whether it is a misdemeanour or a felony, as I understand it, sir, depends upon what statute is violated.

Mr. McCLEAVE: It is still though the criminal law. Most criminal law in the United States is a state matter. You only get into federal matters where you are hauling prostitutes or people for immoral purposes across the state boundaries.

Mr. BAZOS: I am assuming for the purposes of this discussion that a violation in these individual states for this breathalizer thing is a misdemeanour. If I am in error, and they class it as a felony, then it provides another argument.

Mr. WOOLLIAMS: Your best answer to that question is this. In France, you are guilty and you have to prove yourself innocent. Just because they have it in 40 states in the United States does not make it a good law.

Mr. BAZOS: No, sir, in the United States they have the Escabedo case.

Mr. MATHER: I have the implied consent law of California here in digest form and it states: "The implied consent law is a law which provides that if you drive an automobile on a public street you have implied that you have given your consent to a chemical test for alcohol if placed under arrest for driving while intoxicated offence. Refusal to take the test results in the loss of the driving privilege for a specified period." This is the law, whether it is a state law or a federal law.

Mr. BAZOS: No, that is not the point, sir. Is it a felony or is it a misdemeanour?

Mr. MATHER: My bill has to do with a proposed amendment to the federal Criminal Code. This is one of the few things we have in common in Canada.

Mr. BAZOS: Perhaps my lawyer friend over here can explain the distinction that I am trying to put forth between quasi criminal and felony. May I say this to you? If a man is convicted of a breach of this bill, if it is enacted, his record would be deposited with the R.C.M.P. in Ottawa; whereas if he is convicted of a provincial violation such as the Highway Traffic Act or similar legislation in other provinces, it would not be construed as a criminal record to be deposited in Ottawa.

Mr. WOOLLIAMS: Your best stand, if you had caused a disturbance under the Code and you are charged and convicted under the Code it would be in criminal records, but you could under the by-law of a city have caused a disturbance shouted and causing a disturbance is breach of the peace which is not criminal.

The VICE-CHAIRMAN: Are there any further questions?

Mr. BAZOS: May I ask this, sir. Is it your intention in propounding this bill to take care of problems on the highway, as possibly in all your sincerity you envisage, and you do not wish to make the conviction a crime, because if such is the case, I think the matter could be altered very easily by providing the fact that it is not a crime or that you would not have a criminal record in the sense that he refuses to give the test. I do not know.

My own feelings are, as I have stated here, that if I can be convinced that alcohol is a predominant factor, then I would say, let the provinces pass some form of regulatory thing because it has control of the highways.

The thing that I am wondering about is whether you would push this matter to its logical conclusion and whether this would be constitutionally sound. I am also asking you this. Have you ever stopped to think, sir, that if, for example, this was made law and one of my clients was charged with an offence, I would insist that the breathalyzer be sealed and not used for any other test and that that breathalyzer be brought to court and evidence be given and the machine be examined, tested, and the conditions under which the test was administered be duplicated to determine whether in fact the machine was accurate?

The VICE-CHAIRMAN: Are you finished your questioning, Mr. Mather?

Mr. MATHER: Yes, I am finished asking questions, but I would like to answer one or two which have just been asked of me.

Mr. WOOLLIAMS: It is twenty minutes after six o'clock and we have another meeting to go to.

Mr. MATHER: I can answer them very briefly. I can say that the witness has his contention but I would rather support that of the Canadian Bar Association, the Canadian Medical Association and the Canadian Highway Safety Council which support this type of legislation, as I have proved.

Mr. BAZOS: All I can say here is that you look at the statistics that have been submitted and draw your own conclusions.

Mr. MATHER: Will you be here and hear the Bar Association next Tuesday?

The VICE-CHAIRMAN: Gentlemen, I just want to thank Mr. Bazos for coming from Toronto to give us his opinions and ask him to excuse us for delaying his statement from this morning to this afternoon. We certainly will have a second look at all those statistics and your presentation. Thank you, Mr. Bazos.

The meeting is adjourned.

APPENDIX "7"

MEMORANDUM SUBMITTED TO THE CHAIRMAN AND MEMBERS OF THE STANDING COMMITTEE ON JUSTICE AND LEGAL AFFAIRS, HOUSE OF COMMONS, OTTAWA, CANADA THIS 27th DAY OF OCTOBER, 1966, IN RESPECT OF BILL C-87.

Anthony C. Bazos,
Barrister and Solicitor,
1030 Broadview Ave.,
Toronto 6, Ontario.

Total Number Accidents of Motor Vehicles	Criminal Charges of all Descriptions	Personal Injury	Property Damage	Criminal Charge	Charges (Criminal)		Fatalities from		Personal Injuries in	
					Impaired	Intoxicated	Impaired	Intoxicated	Impaired	Intoxicated
				Fatalities				charges		
1965.....	12,484	4,110	8,329	45	1,106	190	4	2	364	70
1964.....	12,484	3,556	8,691	55	1,100	142	2	1	283	35
1963.....	12,302	3,490	9,480	36	1,167	154	6	0	300	43
1962.....	13,006	2,987	8,497	39	1,110	101	2	0	259	21
1961.....	11,523	7,755	2,632	28	1,115	92	4	0	270	18
1960.....	10,425	2,091	6,536	37	1,067	67	3	0	231	11
1959.....	8,664									
	22,872				- NO OTHER FIGURES AVAILABLE -					

The above figures have been obtained from the records of the Metropolitan Toronto Police Department and are subject to written confirmation from the said Police Department.

In referring to the booklet of statistics published by the Ontario Department of Transport in relation to Motor Vehicle Traffic Accidents titled "Accident Facts" 1965 it is noted that "Inattentive Driving" was the most frequent improper driver action reported by the police as a cause in all accidents. (page 1).

Further in the age groups 16 to 24 years the other improper actions reported most frequently were in the following order: Speed too fast for Road and Traffic Conditions; "Driver lost Control"; "Did not have right of way"; "Did not have right of way"; "Driver lost control"; 'speed too fast for road and traffic conditions', (page 2).

In the age groups 25 to 64 years the other improper actions in order of frequency were: 'Did not have right of way'; 'Driver lost control'; 'speed too fast for road and traffic conditions' and over the improper driving action most frequently reported was: 'did not have right of way'. (page 2).

As to the known conditions of drivers involved in all accidents: 192,384, or 91.2% were 'apparently normal'; 3,832 or 1.8% were classed as 'ability impaired'; 13,334 or 6.3% as 'had been drinking'. (page 3).

More than 36.8% of the total reported accidents occurred in Urban Areas (Cities) having a population of 10,000 or over (but not including Metro-politan Toronto). Accidents in Metropolitan Toronto (with about 25% of the Ontario Population) made up 22.0% of the total, while 21.1% happened on the main provincial highways. (page 2).

In so far as fatal accidents are concerned: Driver actions reported by the police in fatal accidents shows that 'inattentive driving' is the largest contributor followed by 'speed too fast for road and traffic conditions'. (page 2).

The reported known condition of drivers involved in these accidents shows that: 1,219 or 78.3% were 'Apparently Normal'; 45 or 2.9% were classed 'ability impaired'; 266 or 17.1% had been drinking. (page 3).

It is to be noted that it cannot be argued in any way that alcohol plays in any way a major contributing factor to accidents on the highways. A perusal of the charts and increased registrations and additional miles travelled by automobiles does not show any significant increase in the ratio to warrant any expression used by certain alarmists as "earnage on our highways as a result of the drinking driver". In fact any such arguments it is submitted have no foundation in fact.

IN ALL ACCIDENTS

IN FATAL ACCIDENTS

- (1) Inattentive driving.

(2) Did not have right of way.

(3) Driver lost control.

(4) Speed too fast for road or traffic conditions.

(5) Other factors.
- (1) Inattentive driving.

(2) Speed too fast for road or traffic conditions.

(3) On wrong side of road.

(4) Driver lost control.

(5) Did not have right of way.

The above table shows the actions of drivers in all accidents and in fatal accidents which were most frequently reported by police in 1965. Concerning a comparison of the various age groups it is established that the younger drivers followed the same pattern as previous years with frequently reported action of the driver involved.

In the age group 65 years or over 'Failure to yield Right of Way', represented the improper driving action most commonly reported. (page 9).

In relation to CONDITION OF DRIVERS

CONDITION	ALL ACCIDENTS	FATAL ACCIDENTS
Apparently normal.....	192,384	1,219
Ability impaired.....	3,832	45
Had been drinking.....	13,334	266
Extreme fatigue.....	777	14
Physical defect.....	638	13
Not known.....	7,426	374
Total.....	218,391	1,931
	100.0	100.0

91.5% of the 218,391 drivers whose condition was classified by the police, were 'Apparently normal', (this includes those whose condition was 'not known'). For those involved in fatal accidents the corresponding figure was 82.5%.

228 more drivers were classed as 'ability impaired', and this is an increase of .2% and 1,685 more who 'had been drinking', an increase of .1% over the 1964 figures. (page 9).

It is submitted that the increase means nothing when one considers the increase in vehicle registrations. Further the statistics do not consider those drivers who may have been drinking with a view to committing suicide by an automobile accident to collect on insurance life policies for the beneficiaries. It is noted that those whose condition was classified as 'impaired' was made up mainly of the age group 25 to 44 years. In the case of those classified as 'had been drinking' it was the age group 20 to 44 which made up the largest share. Personal problems must also be taken into account in the driving ability it is submitted. One must bear in mind the economic conditions which would affect the accident statistics.

Concerning Driver Responsibility in accidents it would appear that the younger drivers (16-24 years) and older drivers (65 years and over) were more frequently 'at fault' than the drivers in the age groups 25 to 64 years. Those drivers in the age group 45 to 54 years showed the lowest 'at fault' rate again in 1965 with the greatest increases being shown in the age groups 16 to 19 years (25.2%) and the 20 to 24 years (11.4%) (page 12).

Fatal accidents increased over all by 9.6% from the 1964 total. Fatal accidents in Metropolitan Toronto showed a decrease of 6.5% while the larger other urban areas showed increases. An increase of 8.2% was recorded in fatal accidents in rural classifications, with those occurring on secondary roads showing the highest increase. (page 14).

One must bear in mind that in Metropolitan Toronto there have been instituted the cross-walks which could quite possibly have a bearing on the reduction of fatalities.

In relation to FATALLY INJURED: of the 1,611 persons fatally injured in motor vehicle accidents 619 (38.4%) were motor vehicle drivers; 564 (35.0%) were passengers and 387 (24.0%) were pedestrians. These three classifications accounted for 93.8% of all deaths reported in 1965.

It is suggested in considering the fatally injured figures one must bear in mind the fact that automobiles could be constructed with certain additional safety features which could well help it is submitted to reduce the fatality ratio.

It would appear that in 1965 in relation to the total number of accidents ability impaired in so far as condition of the driver totalled 1.75% and had been drinking the amount was 6.10%. In the figures for 1964 ability impaired in so far as condition of the driver totalled 1.80% and had been drinking the amount was 6.18%.

In REFERENCE TO THE 1964-5 REPORT OF THE MINISTER OF THE ONTARIO DEPARTMENT OF TRANSPORT

The Statistics reported on pages 23 to 27 of this report tell a story of continued growth in the use of highways which reflects the overall economy of this Province. The number of motor vehicles and trailers registered in 1964 increased by 4.8% over 1963 making a total in excess of 2.5 million.

One item of particular interest in the summary is the reduction in motorcycles of about 2,000 from 1954 to 1964. The smallest number of motorcycles registered since the war years was in 1962 and 1963 when about 7,000 were registered. This number increased in 1964 to ten thousand. **AND THE TREND FOR 1965 INDICATES AN INCREASE IN EXCESS OF 100 per cent.**

The variety of purposes for which passenger type vehicles are now used is reflected by the increase of 133 thousand or 739% in dual purpose vehicles. The following table dealing with the categories of passenger vehicles indicates a trend to the COMPACT CAR and a preference for the 8 cylinder motor by purchasers of regular size automobiles. (page 1).

One should consider it is submitted the deaths that occur as a result of the increase in the use of compact motor vehicles. At page 7 of the report the chart shows a sharp increase in motor vehicle registrations and a considerable drop in the fatal accidents, with a drop from the peak in so far as motor vehicle accidents. The Registrations of motor vehicles are shown at pages 23 and 24 of the Report.

At page 33 of the report there is noted that for the years 1963 and 1964 the convictions for:

1963	1964
DRIVING WHILE INTOXICATED.....	702
DRIVING ABILITY IMPAIRED.....	681
At page 42 of the Report Fatal accidents by type of collision discloses in 1963 1,222 deaths; total motor vehicle registrations 2,268,320	10,240
in 1964 1,202 deaths; total motor vehicle registrations 2,381,219.	

It is submitted therefor that "alcohol" is not a contributing factor in the increase of deaths, from motor vehicle accidents. In the event this Bill C-87 is enacted as law and is put into effect it is suggested that one should consider before this Bill is ever made into law as to who are the people or firms that have a vested interest to see that this bill becomes law:

- (a) Insurance Companies, because the Statutory Conditions provide in an automobile insurance policy that: 2(1) The insured shall not drive or operate the automobile: (a) while under the influence of intoxicating liquor or drugs to such an extent as to be for the time being incapable of the proper control of the automobile.
- (b) Police forces;
- (c) law enforcement bodies such as Crown Prosecutors or Attorneys;
- (d) groups that desire to have drinking abolished or restricted;

It is submitted that convictions are obtained in the Metropolitan Toronto area in at least 91% of all prosecutions for impaired driving. Law enforcement is not prejudiced by the present law for police departments if they wished could as in other jurisdictions take movies of an accused when he is arrested, or have a tape-recording of his voice, both of which could be introduced in evidence at trial. The law as it presently stands is doing a good job.

As a member of the Canadian Bar Association the Writer has been adamantly opposed to any change in the law making a crime what is in essence a social problem, a medical problem.

A special committee of the Canadian Bar Association was instrumental in preparing a report dated on the 19th of February, 1965. The members of this Committee were:

His Honour Judge Harold W. Pope District Judge, Moose Jaw, Saskatchewan;
 His Worship Magistrate S. Tupper Bigelow, Q.C., Toronto, Ontario.
 Walter C. Newman, Q.C., Winnipeg, Manitoba.
 A. Stewart McMorran, Q.C., City Prosecutor, Vancouver British Columbia.
 Hazen Hansard, Q.C., Montreal, Quebec.
 John T. Weir, Q.C., Toronto, Ontario.
 P. D. Isbister, Q.C., Toronto, Ontario.

With the exception of Mr. McMorran, the Writer is of the opinion that none of these persons named have been working members of the Criminal Justice Section of the Canadian Bar Association and in any event have not been members of the Ontario sub-section of the Criminal Justice Section which has been adamantly opposed to any change in the law in so far as Breathalyzers are concerned. It is my understanding that the British Columbia sub-section opposed the proposed suggested change in the law also. There was a spirited discussion in 1965 at the Annual Meeting of the Canadian Bar Association and the Report was withdrawn.

The effect of this proposed change in the law will cause a person to have a criminal record with all its ensuing consequences; it will remove from the field of criminal jurisprudence a basic principle that no man may be compelled to give evidence which will be used to convict him of a criminal offence; it will subject any person to the whim of any police officer whose nature could be at all capricious, to submit to a test; the presiding jurist will not exercise any judgement in determining guilt or innocence of an accused person charge with this type of suggested offence; guilt or innocence will be determined by a machine which is subject to variable factors; no defence counsel could honestly support such a suggested change in the law; no person that believes in the protection of civil liberties could support such a law as proposed; this proposed amendment to the law will not take into account the state of impairment of the automobile driver at the actual time of driving for tests of this nature would be performed at a time period after the lapse of at least one hour after the alleged impaired driving; each individual has a different capacity as to driving and some persons would if in fact it is submitted no person would be impaired at the figure suggested and the figure usually accepted as a rough rule of thumb in Courts of my experience is ".15". One must consider the physical characteristics of the driver, his experience and his tolerance to alcohol. It is submitted that the persons who will drive and drink will not be reduced in so far as fatality accidents are concerned. One may analogize in jurisdictions where the death penalty for murder has been abolished, this has not reduced murders. It is submitted that the proposed law will be unenforceable for in all probability the persons who will conduct the tests will be policemen who could be subject to law suits for malicious prosecutions if it should turn out that there was an error made in compelling someone to take the test. It is suggested that they would not be impartial, under the circumstances. One can envisage a person taking a breath sample in a balloon to have it tested by his own technician, and the mere thought of making it a crime to refuse to blow into a balloon, is ludicrous to say the least. The law is working in an effective manner as it now exists. There has been no case made out that alcohol is responsible for the phrase of certain alarmists, "the carnage on our highways". Deaths occur because of the increasing number of vehicles which are presently using our highways and are causing enormous problems of traffic congestion in larger metropolitan areas. Let not the age of the machine invade our courts of justice and deprive an accused person of the concept of law which has existed for many centuries that every man is innocent until he is proven guilty beyond a reasonable doubt and let us not make of our courts a forum for forcing a man to give the very evidence which will be used to convict him, against his will, and convicting him of a crime as well if he refuses to provide the evidence to convict himself. This would be contrary to all the principles of British Justice and would be contrary to the principles of jurisprudence that have grown over the years in our Canadian Courts. Let us not take the Canadian Bill of Rights and abrogate the provision therein that provides that no law of Canada shall be construed or applied as to authorize a court, tribunal, commission, board or other authority to compel a person to give evidence if he is denied counsel, protection against self crimination or other constitutional safeguards. Let us spend our time in a more constructive fashion to advance the dignity of man, to protect the rights of man, rather than make a crime something that the average citizen of this country is totally unaware of the tragic consequences that could flow if this Bill is enacted into law.

All of which is respectfully submitted,
ANTHONY C. BAZOS,
Barrister and Solicitor,
1030 Broadview Ave.,
Toronto, 6, Ontario.

**OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE**

This edition contains the English deliberations
and/or a translation into English of the French.

Copies and complete sets are available to the

The Clerk of the House.

HOUSE OF COMMONS
First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE
No. 14

TUESDAY, NOVEMBER 1, 1966

Respecting the subject-matter of
Bill C-87, An Act to amend the Criminal Code
(Impaired Driving)

WITNESSES:

From the Canadian Bar Association: Mr. Perrault Casgrain, Q.C., President; Mr. A. Gordon Cooper, Q.C., Dominion Vice-President; Mr. Ronald Merriam, Q.C., Secretary.

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron (High Park)

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,
Mr. Choquette,
Mr. Chrétien,
Mr. Fulton,
Mr. Goyer,
Mr. Grafftey,
Mr. Guay,

Mr. Honey,
Mr. Laflamme,
Mr. Latulippe,
Mr. MacEwan,
Mr. Mather,
Mr. McCleave,
Mr. McQuaid,

Mr. Nielsen,
Mr. Otto,
Mr. Ryan,
Mr. Scott (*Danforth*),
Mr. Tolmie,
Mr. Trudeau,
Mr. Wahn,
Mr. Woolliams—24.

(Quorum 10)

Timothy D. Ray,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

TUESDAY, November 1, 1966.

(18)

The Standing Committee on Justice and Legal Affairs met this day at 11.20 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Cameron (*High Park*), Choquette, Chrétien, Forest, Goyer, Guay, Honey, Latulippe, MacEwan, Mather, McCleave, Ryan, Colmie, Wahn, Woolliams (15).

In attendance: From the Canadian Bar Association: Mr. Perrault Casgrain, Q.C., President; Mr. A. Gordon Cooper, Q.C., Dominion Vice-President; Mr. Ronald Merriam, Q.C., Secretary.

On motion of Mr. McCleave, seconded by Mr. Forest,

Resolved,—That reasonable living and travelling expenses be paid to Dr. I. Rabinovitch, who will appear before the Committee Thursday, November 3, 1966, in accordance with the scale of expenses approved by Mr. Speaker.

The Chairman indicated to the Committee that the dates previously proposed for the hearings in Detroit (November 8, 9 and 10) were not suitable to the Motor Vehicle Manufacturers since their executives would be in New Mexico that week at the Stapp Safety Conference.

After discussion,

On motion of Mr. Ryan, seconded by Mr. Wahn,

Resolved,—That the Committee tour the Automobile Manufacturer's testing and research facilities and hold hearings November 29, 30 and December 1, 1966.

The Chairman introduced the officers of the Canadian Bar Association; Mr. Perrault Casgrain, Q.C., Mr. A. Gordon Cooper, Q.C., and Mr. Ronald Merriam, Q.C. Mr. Casgrain then made a statement covering the resolution and submission of the Canadian Bar Association relating to Bill C-87 (impaired driving).

The witnesses were questioned by the Committee.

On motion of Mr. Mather, seconded by Mr. Forest,

Resolved,—That the resolution and submission of the Canadian Bar Association be appended to today's proceedings (*see Appendices 8 and 9*)

The Chairman thanked the witnesses for making their presentation before the Committee.

At 1.10 p.m., the Committee adjourned until 11.00 a.m. November 3, 1966.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, November 1, 1966.

The CHAIRMAN: We have a quorum, gentlemen. The clerk has supplied me with some motions that he would like to have passed. The first is that reasonable living and travelling expenses be paid to Dr. I. M. Rabinovitch, who will appear before the committee on Thursday, November 3, in accordance with the scale of expenses approved by Mr. Speaker.

Have I a mover and a seconder for such a motion?

Mr. McCLEAVE: I move the motion.

Mr. FOREST: I second the motion.

Motion agreed to.

The CHAIRMAN: Mr. Ray has asked me to mention that the dates we proposed for the hearings on November 8, 9 and 10 are not suitable to the motor vehicle manufacturers as the executives will be in New Mexico that week at the staff safety conference. It appears that November 28, 29 and 30 would be the best alternative dates. The motion which Mr. Ray has suggested, and I think we have agreed on, is that the Committee tour the automobile manufacturing testing and research facilities and hold hearings November 28, 29 and 30. Do we have a mover and a seconder?

Mr. RYAN: I move that the Committee tour the automobile manufacturing testing and research facilities and hold meetings on November 28, 29 and 30.

Mr. WAHN: I second the motion.

Mr. RYAN: But not at their expense.

The CHAIRMAN: No, not at their expense.

Motion agreed to.

The CHAIRMAN: Now, gentlemen, I have the honour and privilege to introduce to the meeting the officials from the Canadian Bar Association: Mr. Terrault Casgrain, Q.C. President of the Canadian Bar Association, who comes from Rimouski, Quebec; Mr. A. Gordon Cooper, Q.C., Dominion Vice President. I think I heard you say you came from—?

Mr. A. GORDON COOPER, Q.C. (*Dominion Vice-President, Canadian Bar Association*): Halifax.

The CHAIRMAN: Halifax. Mr. McCleave will be right at home.

Then we have Mr. Ronald Merriam, Q.C., Secretary of the Canadian Bar Association, and I think every member who is a lawyer is well acquainted with

Mr. Merriam and the work that he does. I call upon this distinguished group to express their views, and the views of the Canadian Bar Association, with regard to Mr. Mather's bill relating to people who drive in an impaired condition. Mr. Casgrain.

Mr. PERRAULT CASGRAIN, Q.C. (*President of the Canadian Bar Association*)
Thank you, Mr. Chairman. The Canadian Bar Association is grateful to this committee for having invited them to present their views.

We have been studying this matter for quite a long time. It started with the Canadian Medical Association back in 1962. As you are aware, the Canadian Medical Association is to their profession what we, the Canadian Bar Association, are to ours. The Canadian Bar Association adopted a 1962 recommendation of a committee of the Canadian Medical Association, and it recommends legislation which will:

1. Recognize the breathalyzer test, carried out by properly trained technicians, as an accurate method of determining blood alcohol levels, and that the results of this test be admissible as legal evidence.
2. Make it unlawful to drive a motor vehicle with a blood alcohol level of more than .05 per cent, which would be 5/10,000^{ths}.
3. Make a submission to the breath test mandatory when requested by law enforcement officers.

That was the resolution of a committee of the Canadian Medical Association. Of course, this committee was not speaking for the association but it was reporting to their association.

The Canadian Medical Association got in touch with the Canadian Bar Association to find out their views on the matter. We realize that it was something which was very controversial at the time. There were very, very strong medical opinions against the test and there were very strong opinion from some doctors engaged in forensic medicine who appear before the courts and have very, very convincing ways of expressing themselves. There were also very strong opinions at that Bar by lawyers specializing in criminal law, and also by other members of the Bar who saw in that legislation an encroachment on civil liberty. On the other hand, there was carnage on the highways and there was a very strong demand by large sections of public opinion that a proper remedy should be found for a situation which some found rather horrifying.

Therefore, realizing there were contradictory points of view and it was a matter which required deep study, the Canadian Bar Association appointed a committee to consider the recommendation of the committee of the Canadian Medical Association and to carry out a very thorough inquiry, not along the line of procedure but by way of obtaining information very similar to the way in which your Committee is now proceeding. We suggest you obtain the opinions of doctors who specialise in this particular feature of their profession and then you get the opinions of lawyers, judges and the police.

This committee is composed of the following:

His Honour Judge Harold W. Pope, District Judge, Moose Jaw, Saskatchewan.

His Worship Magistrate S. Tupper Bigelow, Q.C., Toronto, Ontario.

Walter C. Newman, Q.C., Winnipeg, Manitoba.

A. Stewart McMorran, Q.C., City Prosecutor, Vancouver, British Columbia.

Hazen Hansard, Q.C., Montreal, Quebec, a former President of our Association.

John T. Weir, Q.C., Toronto, Ontario, a former President of our Association.

P. D. Isbister, Q.C., Toronto, Ontario.

That committee made a very thorough study of the matter and came up with the following recommendations. Your Committee therefore recommends legislation as follows:

1. Making it unlawful to drive a motor vehicle with a blood alcohol level to be fixed by the legislation provided—and under paragraph 1 there are five sub paragraphs. This is not the resolution which you have before you, it is a previous resolution. I wanted to show step by step how we arrived at the resolution which you now have before you. These recommendations are:
 - (a) that the level should not be less than .1 per cent or 1.0 parts per thousand of alcohol in venous blood,
 - (b) that the blood alcohol level be determined by analysis of breath only,
 - (c) that the accused is offered a sample of the material to be tested to determine the level,
 - (d) that the analysis on behalf of the Crown Prosecution is conducted by a duly qualified technician, and
 - (e) that the accused must be afforded the opportunity to cross-examine everyone who takes part in the taking of the sample and analysis of it, including the person who is responsible for the maintenance of the equipment used in the analysis.

That is the first paragraph. I will continue:

2. Making it an offence for any person to refuse without cause to give a sample of breath when required to do so by any law enforcement officer who has reasonable and probable grounds for believing that such person has committed an offence.
3. That the offences recommended above be punishable on summary conviction only and that the penalties therefor shall be as for a first offence on impaired driving with no minimum penalty but with the power to prohibit driving on the highways in Canada during any period not exceeding three years.
4. That Sections 222 and 223 of The Criminal Code be deleted and a new section enacted creating a new offence of impaired driving only.

Now, gentlemen, our association functions in the following manner. There is a meeting of the directors of the association in midwinter, and there are a great

number of directors, and that meeting also brings together a great number of lawyers from all parts of Canada. At that meeting, which was held on March 2, 1965, the matter was discussed at great length. Many members of the association expressed views on the subject which were not just an impression, but which were the result of having studied the matter quite thoroughly and some very illuminating debate took place. The majority of the directors of the association thought that the resolution which I just read to you should be substantially adopted, but making the suggested percentage of blood alcohol content a little bit lower, that is, .08 per cent, which I think is eight parts in ten thousand. They thought that 1 per cent was so much that it was really beyond reasonable measure and that a person with that percentage of blood alcohol would be so soaked in alcohol that it would not be practical.

Now you will note the Canadian Medical Association committee arrived at .05 per cent, our special committee arrived at 1 per cent and the doctors arrived at .08 per cent.

This resolution came up again at the annual meeting of the association in Toronto at the end of August or the beginning of September, 1965, and this meeting was not very well attended. It was the closing general meeting and many people had left. As a matter of fact, I believe there were fewer members at that meeting than there were at both the council and the directors meetings, which had preceded this meeting. So, it was felt that the association could not express its views and that it would be better to wait and then put a study of this situation, and the voting on it, on the agenda well in advance of the date of the next meeting so that we would be sure of an almost full attendance. This is what happened at an extremely well attended general meeting in Winnipeg where, after another debate, this resolution which is before you was approved by a substantial majority. Of course, there are two angles to this matter.

From a purely medical standpoint I cannot say whether we are right or wrong in suggesting it should be .08 per cent. I am sure you will seek information from other sources who will check us on that, but that is what we thought, according to the information which we have gathered from the medical profession, was the percentage we should recommend.

What concerned us greatly, of course, was reconciling the civil liberties and traditional rights of an accused with this legislation, and we thought by saying that this would be made compulsory—and I am speaking from the Criminal Code point of view—we would not deprive the citizen of a fundamental right. Whether a man is asked to breathe into a policeman's face when he is arrested or into a machine, which will be more accurate than the policeman's impression to determine whether he has alcohol in his system or not we feel does not really create such a tremendous attempt to waive the rights of a citizen that it should not be adopted. The resolution embodies many safeguards to protect civil liberties and the rights of the person accused. One of those safeguards is that the accused must be afforded the opportunity to cross-examine everyone who takes part in the taking of the sample and analysis of it, including the person who is responsible for the maintenance of the equipment used in the analysis. Well, that differs greatly from the customs and excise law that says, well, here is a sample for the laboratory, there is the evidence. It is evidence until it is contradicted.

and then full opportunity must be given to cross-examine everyone who took part in the analysis. The resolution states very clearly that the evidence resulting from the breathalyzer test is *prima facie* evidence only. It can be contradicted the same as any other evidence.

Then the accused is offered a sample of the material to be tested to determine the level. Well, you may say that he can go to this doctor right after a sample has been taken and have his blood analysed or his urine analysed. Of course he is free to do that and that would be one way of contradicting the findings of the breathalyzer. Also, being supplied with the sample, he is at liberty to have the same analysis performed by a chemist or a competent person of his choice in order to contradict the evidence which might be taken by some office of the Department of the Attorney General.

It has been recommended that an offence is created if the person refuses to give a sample of his breath to an officer who has reasonable and proper grounds to believe that such person has committed an offense. It is also an offence to drive a car with a blood alcohol content of a higher percentage than that determined by law, which is .08 per cent, or whatever percentage may be applied under the law.

Now, we do not recommend there be a minimum sentence. A minimum sentence is within the discretion of the court for the first offence but we recommend there be power to prohibit driving for a period not exceeding three years if the man is found guilty of having a higher percentage of blood alcohol than .08 per cent. I refer only to the percentage, I do not mean refusing to give the test. Then, as a consequence of those changes, that sections 222 and 223 of The Criminal Code be deleted. There are presently two offenses under those two sections: one is drunken driving and the other is impaired driving. Under this legislation the offence of drunken driving would disappear. It is always very difficult to make a distinction between drunken driving and impaired driving, but here there will be only the offense of impaired driving.

That is the resolution, gentlemen, and we are ready to answer any questions you may wish to ask.

The CHAIRMAN: Well, thank you very much indeed, Mr. Casgrain. For the benefit of the members who came in before I completed my introduction, the gentleman who just spoke is Mr. Perrault Casgrain, the President of the Canadian Bar Association. The gentleman to his right is Mr. Cooper from Halifax, the Vice President, and there is Mr. Merriam, the Secretary.

Do you want to say anything at this stage, Mr. Cooper or Mr. Merriam?

Mr. COOPER: Mr. Chairman, I would just like to emphasize what the president of the association has said; that this proposed resolution would result in the creation of a new offense, that is, the offense of making unlawful the driving of a motor vehicle by a person with a blood alcohol level to be fixed by the legislation, and then the resolution sets out the provisos. That is a new offence, something which at present it not in the Criminal Code at all. The other part of the resolution,—or what I think of as the other part—as contained in paragraph 5 of the resolution, deals with offenses already in the Criminal Code, that is the two offenses of impaired driving and drunken driving. Under the

proposal contained in paragraph 5 those two offenses would be deleted from the Criminal Code and a new section would be enacted which creates the new offence of impaired driving only.

I think it is very important, if I may say so, Mr. Chairman, to make abundantly clear that the resolution contemplates a new offence in the words of paragraph one of these resolutions and, of course, carrying on to paragraph two. During the debates on this matter, and they were very extensive debates which were participated in, if I may say so, by lawyers knowledgeable in the field of criminal law and representing many parts of Canada, an analogy was drawn between this new offence and the present offence of exceeding the speed limit. As we all know, if we merely exceed the speed limit on a highway and, we are caught by the police, we are guilty of an offence. One might be driving quite safely and within the bounds of caution, and everything else, but nevertheless one is guilty of an offence if one exceeds the speed limit. Now, this new offence can be likened to that. This new offence relates to the blood alcohol level and once that level is exceeded the offence has been committed.

Thank you, Mr. Chairman, I just wanted to add those few words at this point.

Mr. CHAIRMAN: Thank you very much indeed, Mr. Cooper.

Now, gentlemen, the meeting is open for questions. Mr. McCleave and then Mr. Tolmie.

Mr. MCCLEAVE: Mr. Chairman, has the Bar studied Mr. Mather's bill and does this carry out to perfection the purport of the resolutions of the Canadian Bar Association.

The CHAIRMAN: Mr. Merriam can answer this.

Mr. MERRIAM: Mr. Chairman and Mr. McCleave, I am quite certain Mr. Mather's bill is directed toward the same ultimate goal as our resolution. I think there is one distinction that possibly Mr. Cooper drew here a moment ago that is very important which may not have found its way entirely into Mr. Mather's bill, in the sense that this resolution is not directed to impairment as we now know it and as it has been traditionally interpreted over the years, it is directed to a completely new concept of being unfit to drive a car or that you should not be in charge of a motor vehicle if you have an alcohol content of a certain level. Now, Mr. Mather's bill, as I read it, continues the concept of impaired driving and it would seem to me that the court would still have to interpret that word "impaired" in the first paragraph of the bill, and this is one of the things we are trying to get away from, the concept of "impairment."

Mr. MCCLEAVE: The second question I have is that Mr. Mather's bill provides for a police officer who has reasonable and probable grounds, and so on, but should we not have a provision in there that the police officer either gives the standard warning to the driver, or says, "I have reasonable and probable grounds to think that you should have this test because your car went over the white line", or state specifically what the police officer is concerned about.

Do you gentlemen have any comment on that? That is, either a warning in the standard form that we have now or a statement by the policeman, not in court but at the exact time, as to why he is taking this step.

Mr. COOPER: Mr. Chairman and Mr. McCleave, I think it is fair to say that we thought we had covered that point by paragraph 2 of the resolution, "Making it an offence for any person to refuse without cause to give a sample of breath when required to do so by any law enforcement officer who has reasonable and probable grounds for believing that such person has committed an offence." I suggest that if a law enforcement officer stops somebody, I do not think that one should require a provision in the bill as to warning if the person whom he stops considers that he has been driving in a proper manner and has not had enough to drink to get to the level which might be prescribed by the legislation and refuses to give a sample of breath. Then, of course, in any subsequent proceedings the law enforcement officer, as I see it, would have to establish reasonable and probable grounds for believing that such person has committed an offence.

Mr. McCLEAVE: Now, my third point. I do not know if you gentlemen were personally involved in the discussions with your counterparts from the Canadian Medical Association on this matter, but am I correct in my mathematics to anybody's recollection that the acceptable alcoholic level in the blood of a 200 pound man, to bring it home, is about two and one half ounces—which is one decent drink—and beyond that you are in trouble.

Mr. COOPER: Mr. Chairman, Mr. Merriam has just made a comment to me and I think his comment is correct; that is not our information. As a matter of fact, gentlemen, and I do not want to interject any personal note in this discussion at all because I am not here in any other capacity than as an officer of the Canadian Bar Association but I may say, although my weight is not 200 pounds, that I have taken this breathalyzer test on three or four occasions and I can assure Mr. McCleave, who probably knows me well enough to know it anyway, that I had more than two and one half ounces when I took the test and I am very proud to say that I passed the test, although I do not think I would have wanted to take my car out on the road.

Mr. CHAIRMAN: Mr. Tolmie, Mr. Woolliams, Mr. Mather, Mr. Forest and then Mr. Honey.

Mr. TOLMIE: Mr. Chairman, in our particular area if the police have a reasonable and proper cause to suspect that someone has been drinking and driving they will take him down to the police station and give him certain tests, such as walking a line, picking up a pencil or taking something out of his wallet. If he does not pass these tests, and also in the opinion of the policeman involved as to his general condition, he is charged. I would think perhaps between 90 and 95 per cent of the people who are charged in such a manner are convicted. Now, if we take the same situation and take the man down to the police station and give him the breathalyzer test, no doubt he would be over the .1 per cent as suggested. What I am trying to establish in my own mind is this: do I understand that the breathalyzer test would act as a deterrent? The whole purpose of this legislation is to eliminate accidents and death and destruction on the highways by people who are driving and drinking. Now, assume for a moment that I am going to drink. Am I going to be any more deterred from drinking and driving because I have to go down to the police station to take a breathalyzer test than I would be deterred by the fact I know that if I am driving in an erratic manner the police are going to apprehend me and take me down and make me undergo these examinations, with perhaps the same result. I would like to hear some

comment on the basic premise of this whole breathalyzer test; that it is a real deterrent that will prevent people from drinking and driving, and I have not heard a clear explanation of this point. I would like to have your comments, gentlemen.

Mr. CASGRAIN: First of all, let me thank you for having brought up the point of deterrent, which is something I should have covered in my opening remarks. The purpose of this amendment, in the view of the Canadian Bar Association, is to make this a deterrent in the same way as the speed limit is a deterrent. In other words, as Mr. Cooper said, you may safely drive a car at 100 miles per hour if you have all the conditions required for that; your automobile mechanically in order, nobody on the road, straight road, and all that, and yet violate the speed laws which forbid you to drive beyond 60 or 70 miles an hour. Now, the effect of this deterrent is that if a man feels that he can drive at 100 miles an hour on a nice road, when he gets to the end of that nice road he is still driving too fast and if he had been afraid of being fined for driving over the speed limit set by provincial statute, then he will arrive at the more dangerous part of the road driving safely, which perhaps he would not do otherwise. It is the same thing where a man is at a cocktail party or spending an evening with friends; he has to worry about driving back home. He must watch the number of his drinks. Well, that is all right, he may stand his drinks well—and, of course, I know nothing personally about this, as none of you do—but I have been told that some people after a few drinks imagine that they are sober and the more they drink the soberer they feel! So, the deterrent would be that the man who expects to be driving his car afterwards would be deterred from having quite as many drinks as he might otherwise have because he thinks he would look very foolish if he has to be faced with and meet the breathalyzer test, although he has committed not crime, just an offense.

Mr. MATHER: Mr. Chairman, I would like to make a comment on this point of deterrent. We had evidence previously from Dr. Ward Smith, of the Department of the Attorney General in which he pointed out that the breathalyzer test has been in operation in Ontario for ten years on a voluntary basis. During that time there have been the following statistical result, respecting people who would take the test and who would not take the test. When they started the breathalyzer test in Ontario only 6 per cent of the people checked refused to take the test when asked to do so. In the following nine years the percentage of people who were asked to take the test but declined had risen to 26 per cent, and the contention of the law officers concerned is that this level of change represents sophisticated drinking drivers, who are the hard core of drinking drivers and who know they do not need to take the test so that they get by with the present law, which does not really deter them to the extent that they know they do not have to take the test. The contention is, I think, that if there was a mandatory test this would be eliminated.

Mr. TOLMIE: Yes, this is the point I was driving at because, taking myself for example, I might feel that I can go to a cocktail party and have a number of drinks and if I am apprehended I might feel I have such control over my faculties that I could perhaps delude a policeman and would not be apprehended. But if I knew for some reason, or perhaps there was an accident, I was going to be caught by the police, and regardless of my outward appearance I would have

to take a test, then, looking at it from my own personal standpoint, I might be a little more careful about whether I would drive or not. This is the point I wanted to establish in my own mind. That is all.

Mr. COOPER: Mr. Chairman, I might also add that the conclusion of the report of the special committee of the British Medical Association held in London in 1960 contains this paragraph:

"The Committee believes that a substantial reduction in the number of accidents caused by alcohol has been achieved where it has been made an offence to drive a motor vehicle when the concentration of alcohol in the tissues is in excess of a certain level."

I think that is an authoritative statement which leads to the conclusion that legislation of the type proposed here does act as a deterrent. I also believe, although I cannot document this at the moment, that experience in countries such as Sweden, where such legislation is in effect, is that the legislation has acted as a deterrent. Some interesting observations were made during the debate on this matter before the council of our association in another case, that there are guides which one can obtain even today which you can carry in your pocket which indicate within certain reasonable limits whether you are going to be able to pass a test such as is proposed here or not. The time may come when we will all have a handy guide in our pockets at cocktail parties and be able to tell pretty well what is going to happen to us if we go out on the road, having had the number of drinks we have had, if we are apprehended by a police officer. This is a real possibility. This is another aspect of the matter which bears, I think, on the deterrent question which has so properly been raised by a member of the committee who spoke to it this morning.

The CHAIRMAN: Mr. Tolmie.

Mr. TOLMIE: The host at issue; these indicators do all the guests depart.

Mr. AIKEN: Mr. Chairman, on this point, I believe it was Abraham Lincoln who said liquor has no defense and he pretty well indicated that once he took one drink a man was off his normal track of thinking, and so on, and that he did not know how far he was really going to go. Now this is not true in every case but I suppose it does happen.

My point is that I suspect the main deterrent might be that he is probably not going to drink at all some evening because of the fact that he may have to face a breathalyzer test, and I think it would be primarily in that area where the deterrent comes in.

Mr. CASGRAIN: Mr. Chairman, here are the words used by the report of the special committee of the British Medical Association:

The Committee believes that the substantial reduction in the number of accidents caused by alcohol has been achieved where it has been made an offence to drive a motor vehicle when the concentration of alcohol in the tissues is in excess of a certain level.

Mr. TOLMIE: They do not state the level.

Mr. CASGRAIN: No. Well, that is another matter.

Mr. WOOLLIAMS: Before I ask any questions I join with the other members of the committee in welcoming the members of the Canadian Bar Association, Mr. Casgrain, Mr. Cooper and Mr. Merriam. I know they have left their busy profession as members of the Canadian Bar. I know they have made a good contribution in this matter because it has been under study by the Canadian Bar Association for some time.

My first question is this, does the committee anticipate retaining the old charges, the impaired driving charges, in spite of the additional offence that you have added in your recommendation?

Mr. CASGRAIN: Yes, sections 222 and 223 would be replaced by one section, which would be on impaired driving only.

Mr. WOOLLIAMS: I take it, then, that a person who refuses to take the breathalyzer test could be found guilty of an offence and at the same time, by using other evidence, could be found guilty of impaired driving?

Mr. CASGRAIN: Yes.

Mr. WOOLLIAMS: There is one matter which bothers me, and that is leaving it to the discretion of a police officer who has reasonable and probable grounds for believing a person has committed an offence. This is giving quite a bit of scope to police officers and I am sure the committee considered that when they made the recommendation. I suppose a police officer could always say, when he was giving evidence on the witness stand and in the event someone had refused to take this test, that he had reasonable and probable grounds to ask for it, and he can develop certain facts which would quickly lead a magistrate or a judge to come to the conclusion he did have reasonable and probable grounds. We know it is very difficult in the line of cases where you have to prove there was not reasonable and probable grounds to do this. Once a police officer has asked you to take the test and you refuse, it would be very difficult to conduct a proper defence so that a person could be acquitted.

Mr. CASGRAIN: Well, my answer to this would be, of course, that the police officer would have to satisfy the court that he had reasonable grounds; you could not satisfy the court merely by saying so, the court would have to have proper evidence and the laws of evidence are such that the benefit of the doubt is always granted to the accused.

Secondly, even then he has no reason at all to fear the test. He is perfectly sober; why should he refuse to take it?

Now, in these remarks I have made I have been speaking in my personal capacity and not as a lawyer.

Mr. WOOLLIAMS: Has the committee satisfied itself from scientific evidence or other material that has come before it that the breathalyzer test is an accurate test? In other words, when you use the term "prima facie evidence" in a practical approach in law, it refers to prima facie evidence of the sort that once the test shows that a man had a certain alcoholic content in his blood which was determined by a machine then it is very difficult to upset that. It is like radar on a highway; once the machine indicates that Mr. A has a point so and so alcohol in his blood, from the practical approach he has

had it, because it would be very, very, difficult to defend yourself against that type of evidence. I have not studied this matter, I have read the odd article on it, but there is some question about it. Have they considered that a blood test might be more accurate?

Mr. CASGRAIN: They considered the blood test and the urine test and they reached the conclusion that the breathalyzer test was the easier one to take, the one that was less annoying for the person who was subjected to it, and the committee certainly did satisfy itself that those breathalyzer machines are accurate if the person who makes the test on the machine and reads the machine knows his business.

Mr. WOOLLIAMS: One further question, Mr. Casgrain. There was a suggestion—and I say this with the greatest of respect to you and I know you have thought this through—that once a person is arrested on one of these charges, if he is not satisfied with the breathalyzer test and says: "I want a blood test," and these other tests which he may consider more accurate, it is very difficult to get that test. In my experience, and I am sure it is the experience of many lawyers, once a person has been incarcerated on one of these charges it is difficult to get a doctor, difficult to get out, difficult to get bail, difficult to get a blood test, so that from the practical approach I doubt whether any accused person would be able to get a blood test or urine test or any other test that might in his opinion satisfy him that the breathalyzer test had not been accurate as far as he was concerned.

Mr. CASGRAIN: You might be right at that, but if the law is followed and if he is given the opportunity which a man must be given after he is arrested, he will be able to have his blood test because that is a measure that is used by the police.

Mr. WOOLLIAMS: Well, I appreciate that, and I say this with the greatest respect, but you know and I know in these big cities like Toronto, Montreal, Vancouver and even Calgary or Winnipeg where they have so many accused persons who are arrested at night—certainly this was my experience when I was a young practitioner—it is very difficult for an accused person to get that kind of service out of the police. The Bill of Rights is a wonderful piece of philosophy, but when you get down to one of those cells it seems to disappear very quickly under the influence of police officers.

Mr. CASGRAIN: Incidentally, I may say that the breathalyzer test can be of actual aid or help to an accused person because it would show at once that he did not have the blood alcohol content required to be in a state of intoxication and he would be released at once. In some cases it might be very helpful because if a person is sick or has been in an accident and they appear groggy, if they have the great misfortune to have had one glass of beer or one glass of scotch beforehand, when the policeman discovers their eyes are bloodshot or they have difficulty in speaking, difficulty in walking, although the person may be perfectly sober, the policeman may think otherwise, and in this way the breathalyzer test would be a great help to those people.

Mr. WOOLLIAMS: Well, Mr. Chairman, I want to thank both the president and the vice president.

The CHAIRMAN: Mr. Mather, Mr. Forest, Mr. Honey.

Mr. WAHN: Paragraph three of the resolution reads: "The person whose conduct is being investigated shall be advised that at his request he is entitled to be given a sealed sample of his own blood or his own urine at the time any other test is conducted". If this were made part of the legislation and the police refused to do it this would invalidate the breathalyzer test, would it not?

Mr. CASGRAIN: It would be a double check on the breathalyzer test.

Mr. WAHN: But am I to understand, from what Mr. Woolliams said, that this protection, if it were written into the legislation, would not be effective in practice?

Mr. CASGRAIN: Well we asked that it be written into the legislation.

Mr. WAHN: Would this not overcome Mr. Woolliams's objection?

Mr. CASGRAIN: From the standpoint of writing the law it would, but it remains to be seen whether it would in fact.

Mr. WOOLLIAMS: Just speaking to that, Mr. Chairman, I agree with Mr. Casgrain in that regard. The trouble is that in my experience, and in the experience of a lot of lawyers who have done some criminal work, police work on the whole before a magistrate, and particularly when they call them police magistrate and judges—they are pretty jealous of each other at times—is carried on in such a way that when an accused person comes forward and says, "Well, I did ask for a blood test and I asked for these other tests", the police can easily brush this aside—I know that we have the laws of perjury but I am speaking in a practical sense—and say, "Well, you never asked for it", and that rather negatives that suggestion. The Bill of Rights decrees that you are entitled to counsel and you are entitled to this and that. Many lawyers who are doing this work know that if four or five hours afterwards somebody is permitted to call a lawyer and then this is brought to the attention of the magistrate or the judge, nothing happens. What can you do? Suppose the police do refuse an accused person a lawyer or this kind of protection, what is the import of the law in respect to protection in that regard? The magistrate may just shrug his shoulders, "So what?" This is one of the great problems which we have when we talk about civil rights. From a philosophical point of view it sounds beautiful but in practice where they are very busy in these large cities—and I have some knowledge of that—I do not think the accused person always gets the protection he is entitled to under the law.

(Translation)

Mr. CHOQUETTE: To follow along the lines of Mr. Woolliams—Once I had a bill standing in my name, but, as in the case of a lot of bills, nothing came of it. However, be that as it may, it should become an offence for every police officer to refuse to conform to the provisions of the Act. I think if we were to adopt the resolution as submitted by the Canadian Bar Association, it would be a good thing at the same time to move that it become an offence for a policeman to refuse that the accused have immediate communication with his lawyer. It is a fact that the accused is often deprived of that right, a right which is supposed to be guaranteed by a Bill of Rights.

Mr. CASGRAIN: I am very much impressed both by what you have said and by what was said by the honourable gentleman who spoke before you. But we, I

the Canadian Bar Association, did all that it was possible for us to do within our frame of reference, that is within the Criminal Code. We have put in here safeguards for

(English)

The person whose conduct is being investigated shall be advised that at his request he is entitled to be given a sealed sample of his own blood or his own urine at the time any other test is conducted.

(Translation)

This means obviously that not only is the accused entitled to ask for it, but that he must also be informed of that right of his. In this particular section of the Criminal Code, according to my modest opinion, we can hardly go further. What you have suggested is one of the great problems in respect of human rights, if you prefer that expression to that of civil rights. You can speak of the rights of man, of course, like this other gentleman. In any event, we should deal with the matter through more general legislation similar to this. I could, of course, refer to the possibility both of you have referred to. That is a point, of course, but there are other possibilities. Decent people are arrested for other offences than that.

Mr. GUAY: A supplementary question. Would the blood test have the same value as the other.

Mr. CASGRAIN: Obviously, the breathalyzer test makes nothing but a prima facie case. It can be contradicted.

Mr. GUAY: Yes, through a blood test but there will be a time lag. Take the case of the very remote area where we have no doctor, no nurses, nobody who can have this breathalyzer test administered. If two hours elapse between the two—

Mr. CASGRAIN: It should be simultaneous.

Mr. GUAY: But in some cases it would be impossible.

Mr. CASGRAIN: But in those cases they probably will not have any breathalyzer.

Mr. GUAY: Yes, but the police officer can find a breathalyzer more easily than he can find a doctor where you have no doctors. In other words, the person who is arrested, the accused, would not be provided with the same means of defending himself. The Crown will have the advantage. I made a remark on this in the House of Commons when we were dealing with the defence open to the accused in the case of the death penalty. In other words, we are not here put on an equal footing. If there are two hours or two hours and a half between the breathalyzer test and the blood test.

Mr. CASGRAIN: In a remote area, the breathalyzer will not exist. It will probably be used in large centres, but in other places I do not think we will have sufficient equipment to carry out all these tests, laboratory tests or others. But here is no perfect legislation.

Mr. GUAY: But what about all the other types of evidence? Are they retained?

Mr. CASGRAIN: All of them.

Mr. GUAY: Nothing is being removed?

Mr. CASGRAIN: Yes, they are all being retained. We are not dealing only with laboratory and medical tests. All other means of defence will be retained.

(English)

Mr. MATHER: Mr. Chairman, as the sponsor of Bill No. C-87, which I think is exactly the same as the resolution which the Canadian Bar Association is aiming at, I am naturally very pleased with the testimony of these gentlemen and appreciate the trouble they have taken to come here today. Frankly, my bill was drafted on the basis of the 1964 recommendations of the directors of the Canadian Bar Association and there is very little, if any, difference between the objectives or the details of your resolution and the bill. For example, I think we both aim at making the breathalyzer test mandatory, we would both declare a .08 per cent blood alcohol level as the standard, we would both amend the existing legislation by changing clauses 222 and 223 and, finally, making impaired driving an offence by itself.

I want to ask one question which may result in an answer to questions raised earlier as to the degree of corrections or accuracy or the faith to be put into the breathalyzer test. I do not know if the committee from the Canadian Bar Association is familiar with this, but the committee of the British Medical Association recently declared that the taking of evidence by police in cases of suspected impaired driving, that is, the man breathes into a policeman's face, possibly the policeman asks the man to walk, this sort of thing, but they say this is not good enough. It is much safer and more accurate if you have an impartial piece of equipment, such as a breathalyzer, do the actual testing and that in several cases, I think about 10 per cent of the cases where this is done, the person tested is found not to have this blood alcohol content. I would ask the representatives of the Canadian Bar Association if they would agree that an impartial machine is, after all, probably a more scientific basis for testing alleged impairment than other methods previously used.

Mr. CASGRAIN: There is not the slightest doubt as to that, but the Canadian Bar Association feels that to protect civil liberties and prevent—in as much as the law can—depriving anyone of his rights or expose him to being unjustly sentenced, that we have that proof in that part of your bill which says that the level of .08 per cent is conclusive evidence that the ability of the person to drive is impaired and this creates a separate offence, but would it be conclusive evidence of impaired driving?

Mr. MATHER: You agree, as I do, that there should be safeguards for the person being questioned, such as set out in clause (4) of the bill, "shall be conducted by a duly qualified technician" and clause (5), "The accused must be afforded the opportunity to cross-examine" the people taking it. I think we are on exactly the same grounds there. In your submission you also make it an offence for a person to refuse to take a test and he will face a charge, there.

Mr. CASGRAIN: He will face a charge but with no minimum penalty, so that if he has just committed a technical offense the judge could let him go with almost a reprimand.

Mr. MATHER: I am very pleased with the recommendations of the Canadian Bar Association and, of course, my whole intent is to get—some differ on whether it is .08 per cent, some say 1. per cent would be safer—some definition of “alcohol content” and some mandatory legislation to safeguard both the driver and the public in these cases.

Mr. COOPER: Mr. Chairman, if I may just make a comment, I believe that .08 per cent or .8 parts per thousand of alcohol in venous blood is now accepted by the British Medical Association, and it has also been accepted by the Canadian Medical Association as the proper level.

Mr. MATHER: It is, that is true. Some people who testified before our committee earlier said they might feel a little happier about this proposed legislation if the blood level content was just a little bit higher than .08 per cent. I think the American Medical Association also favoured .08 per cent.

(Translation)

Mr. FOREST: Mr. Casgrain, you mentioned in your presentation that the report prepared by the committee with Mr. Isbister and which had been substantially adopted by the Canadian Bar Association had not originally been adopted by the Canadian Bar Association meeting in 1965. Did anybody at the time say that this was an invasion of private rights, and so on? Is there any report on that particular aspect of the matter?

The matter, I believe, was set back until later, but the more steady result of the matter, was it—I was not at the meeting but—

Mr. CASGRAIN: There was some discussion among sections, but finally in the 1966 convention, there was general agreement on the matter.

Mr. FOREST: There was no contrary (?) report then.

Mr. CASGRAIN: What happened was that we had the impression that there was some urgency in the matter. We felt that the government wanted an opinion earlier. We had therefore submitted to the Minister of Justice, I believe, our resolution, that is the resolution adopted by a committee of the directors of the Association. There had been a very long discussion about that at our mid-winter meeting in 1965. It was decided at that time that the matter would be resubmitted in its entirety to the Association's Second General Meeting. It had been decided, too, that we would send to all members of the Association, to every one of the 10,000 members of our Association, that we would send to them by mail the text of the resolution which was discussed in Toronto and which is the one you now have before you. In other words, you can be assured, as you say in English, that we are now speaking with one voice.

Mr. FOREST: But even provincial sections, the Quebec section, the Montreal section, received a report from Dr. Roussel and adopted a similar resolution.

Mr. CASGRAIN: I believe so.

Mr. FOREST: The provincial sections were in agreement with the national Association.

Mr. CASGRAIN: Finally they got around to agreeing. The agreement was actually reached in Winnipeg. There is no doubt whatever on the matter.

(English)

The CHAIRMAN: Mr. Honey.

Mr. HONEY: Thank you, Mr. Chairman. There are two or three matters that I would like to refer to briefly. I am wondering, Mr. President, in reference to the concern of the members of the Canadian Bar Association about civil rights, whether there was any discussion on the theory of implied consent that I think has been implemented by some of the provincial jurisdictions. In other words, there is an implication that when you apply for an operator's licence that you have consented to a blood test or a breathalyzer test. I appreciate that this is something within provincial jurisdiction and really probably does not concern us here, but was this considered?

Mr. CASGRAIN: It was not gone into at any depth, but my personal feeling is that it is somewhere in the grey area where you do not know exactly whether it is federal or provincial jurisdiction.

Mr. HONEY: If parliament enacted legislation along the lines of your resolution you would have no concern about the right of parliament to impose the obligation of taking a breathalyzer test?

Mr. CASGRAIN: On this point, sir, I cannot speak for the association because it is a constitutional issue which was not raised during our debates because everyone was so interested in the substance of what we wanted that the means were not discussed as much as was the jurisdiction. But I repeat that it may be in that grey area where you do not know exactly whether it is provincial or federal jurisdiction. I will compare that to the offence which is now in the Criminal Code of drunken driving or impaired driving, which in itself is not an offence. Willful dangerous driving is a criminal offence in itself, but impaired driving is not a criminal offence in itself, it is created by statute. It does not derive from the philosophy of law, it derives from the will of parliament, and yet this has been tested in the courts and has been found to be within the ambit of the legislative power of parliament. I do not see much difference between telling a man, "You must not drive after you have been drinking to the point of being drunk," or telling him, "You must not drive after having taken so much liquor". That is my answer.

Mr. HONEY: Mr. Chairman, I also want to make this comment with reference to section 2(a) of the resolution. I am wondering if you should not qualify or more particularly describe the offence referred to in the last part of that section, "by any law enforcement officer who has reasonable and probable grounds for believing that such person has committed an offence". Now, Mr. President, are you referring to a traffic or driving offence?

Mr. CASGRAIN: I speak for myself, but as we are dealing with the Criminal Code I would imagine—although I am not sure—it would be an offence under the Criminal Code.

Mr. HONEY: Let us assume I am driving normally in a proper fashion down the road, having had enough drinks to raise my alcohol content to .09 per cent and suppose a police officer stops me because of some whim. He just decides he wants to stop me. Would the Canadian Bar Association contemplate that if he smelled alcohol on my breath he would then be entitled to require me to take a breathalyzer test? This is what concerns me about the wording of this section.

Mr. CASGRAIN: It would be an offence to have a too high content of alcohol in the blood and the officer could reasonably suspect that such an offence exists.

Mr. HONEY: I agree. My purpose in raising it is only for clarification. In other words, when you use the word "offence" there, I take it you are including the offence set out in section 2 (a)?

Mr. CASGRAIN: That would be my personal interpretation.

Mr. COOPER: Mr. Chairman, I think I can safely say that the intent of the proposed legislation would be such as to permit the police officer, having stopped the car and smelled alcohol, to demand that the driver of the car undertake a test. I would think that situation would come within section 2 (a). I am not now attempting to place an interpretation on section 2 (a) officially for the association, but I believe that would be the intent of section 2 (a).

Mr. CASGRAIN: Moreover, if the police officer smelled alcohol on his breath he might suspect him of impaired driving, which is another offence which would still be in the Criminal Code.

Mr. HONEY: Under those circumstances he probably would not be able to convict him of impaired driving because my question was premised on the basis that there was nothing wrong with the manner in which I drove. Probably the only offence which could be included in your term "offence" would be the suspicion of the officer that I had committed the offence of having too much alcohol in my blood.

Mr. CASGRAIN: Or of impaired driving as well.

Mr. HONEY: My question was on the premise that I was driving properly. This is the only thing that bothers me, whether or not you feel in those circumstances, where I was driving properly and on some whim of the officer he stopped me and smelled alcohol on my breath, he would then have reasonable and probable grounds for requiring me to take a breathalyzer test.

Mr. MATHER: That would be dangerous.

Mr. HONEY: But you feel this would be included in the resolution?

Mr. CASGRAIN: That is a personal opinion. That is Mr. Cooper's opinion.

Mr. HONEY: The only other thing, Mr. Chairman, with reference to the new offence of impaired driving that it is suggested be created is that this would not be dependant upon .08 per cent alcohol content?

Mr. CASGRAIN: Not at all.

Mr. HONEY: Thank you.

The CHAIRMAN: Mr. MacEwan, Mr. Guay and then Mr. Ryan.

Mr. MACEWAN: Following the question of Mr. Guay and perhaps on a more provincial basis, I would like to ask Mr. Cooper regarding the breathalyzer equipment in our own province, for instance; where you envisage this equipment could be located, who would provide it, and so on. I wonder if he has any ideas.

Mr. COOPER: No, Mr. Chairman, I have no definite ideas on that point. Actually, if this legislation is going to be implemented, much will depend on the proper location of the breathalyzers and on duly qualified technical personnel to

operate those machines. I may say that at least some months ago—I am speaking parochially now—in Nova Scotia we did not have qualified technicians. Dr. Ward Smith of Toronto came down to Nova Scotia when we had a panel discussion on this subject, and I think that the committee could best direct a question such as Mr. MacEwan has raised to Dr. Ward Smith, who has had such a tremendous amount of experience in Ontario on the operation of breathalizers, and I understand that Dr. Ward Smith either has or will be appearing before the committee. I do not want to evade the question in any way but at the same time I must at the moment say that in Nova Scotia we would not have breathalizers located at strategic points, we would not have the machinery necessary to enable the legislation to have full effect. I do not think that it would be too difficult to provide that machinery. I may be anticipating to some extent what Dr. Ward Smith may say, but from my conversations with him I do not think there would be any great difficulty in providing the machines and providing the properly qualified technicians to run those machines.

Mr. MACEWAN: As far as the accused is concerned, what about the possibility of rebutting this prima facie case by way of blood or urine tests? Do you think, Mr. Chairman and Mr. Cooper, that along with breathalizers such other equipment to assist in this way could be provided as well?

Mr. COOPER: I would think so, Mr. Chairman.

Mr. MACEWAN: One more question, Mr. Chairman, directed at Mr. Merriam or I can ask the three gentlemen if they read the evidence which was given at our last meeting by Mr. Bazos, who quoted scripture and verse many of the statistics put out by the Department of Transport in the province of Ontario which he submitted pointed to the fact—I will not go through it, I do not have a copy of the evidence here—that in a small percentage of the accidents the use of alcohol was really the effective cause of the accident. Have you any comments to make on that or would you like to read the evidence?

Mr. CASGRAIN: Mr. Bazos very strongly expressed his views at the general meeting of the association, where the resolution which was submitted to you was nevertheless carried.

Mr. MACEWAN: I see. Thank you, Mr. Chairman.

(Translation)

Mr. GUAY: Whoever refuses without any valid reason, what are the reasons which would be judged valid in the case of refusal, whoever without any reasonable, what are these valid reasons?

Mr. CASGRAIN: One valid reason is that being perfectly sober, he is guilty of no infraction. He could make that answer to any policeman who puts a silly request to him. This would be an extreme case, but it would certainly be a valid reason.

Mr. GUAY: In other words, anybody who has a little bit of alcohol on his breath has to submit to the test?

Mr. CASGRAIN: A little alcohol?

Mr. GUAY: Yes. Well, what is the principle?

Mr. CASGRAIN: The principle is that if he has had only one glass of scotch and that he was driving at a perfectly safe rate of speed nothing justifies his submitting to the test. He could of course submit to the test for practical reasons.

Mr. CHOQUETTE: But if he refuses he is arrested immediately.

Mr. CASGRAIN: Yes.

Mr. CHOQUETTE: Whatever the valid reasons are?

Mr. CASGRAIN: Some people like to fight for liberty on principle. He can always submit to arrest.

Mr. GUAY: If there was a refusal, Mr. Casgrain, can he be accused of the two infractions, a) of refusing the test and, b) of impaired driving. Can the two infractions take place at the same time?

Mr. CASGRAIN: How can you establish the alcohol percentage without a blood test or urine test?

Mr. GUAY: I am speaking of the means which exist at the present time.

Mr. CASGRAIN: Yes, he could be accused of impaired driving, *i.e.* of having driven his car while in an impaired condition. He could be proceeded against on those grounds.

Mr. GUAY: You say that the same type of evidence can be brought in, in future, the law of evidence will not be changed?

Mr. CASGRAIN: It will be retained not only in favour of the accused but also for the benefit of the Crown.

Mr. GUAY: You say that his driving license may be withdrawn from him for a period in the Province of Quebec. I do not like the use of the word "may". Take the case of the person who, being sentenced, is not thereby deprived of his driving permit, but whose license is nevertheless automatically withdrawn from him by the Motor Vehicle Licence Bureau. Why do we say "may" then in the Province of Quebec? Is that province alone in this respect?

Mr. CASGRAIN: At this time you are being called upon to discuss Federal general legislation, criminal law, but we have here what I called a grey area. We are faced here with a somewhat difficult position jurisdictionally as far as highway control is concerned. In some provinces it is felt that it should be automatic for the provincial authority to be enabled to withdraw the driving licence each time a person is found guilty of such an offence. On the other hand if you find it is a little too much perhaps you could do something about it.

Mr. CHOQUETTE: What then, are the valid reasons which a policeman could have to force anybody to submit to a test? Say somebody has been to a party, has had one or two cocktails, and then goes on the road, and exceeds the speed limit. In a 60-mile zone he was going 75, he is stopped. The policeman smelling his breath notices that it smells alcohol, the cocktails our friend has had.

Mr. CASGRAIN: Speaking only for myself here—I do not like speaking for myself too much in this connection—I wonder if we could not distinguish here between reckless driving, which is a federal offence, an offence under the Criminal Code, and exceeding the speed limit which comes under a provincial statute?

Mr. CHOQUETTE: This is a very hypothetical case but even so it may happen quite often. It is like the fellow who has had two cocktails, who exceeds the speed limit and the policeman says "Aha, this fellow might be drunk".

Mr. CASGRAIN: I wonder if this would not be an offence created by provincial statute. Supposing we have a fellow who is doing 35 miles an hour in a 30-mile zone. He would be committing an offence against a provincial statute but I wonder why he could be convicted on a federal statute for refusing to submit to a test.

Mr. CHOQUETTE: But he has not been accused of reckless driving here. This is a matter of pure coincidence. The fellow has exceeded the speed limit and the policeman smells alcohol on his breath. Is that a good and valid reason to refuse to submit to the test?

Mr. CASGRAIN: If he were doing 35 miles an hour in a 30-mile an hour zone, and if he has had only one draft, I think he would have a valid reason to refuse.

Mr. CHOQUETTE: Good.

The CHAIRMAN: Mr. Ryan, Mr. Wahn and Mr. Latulippe.

Mr. RYAN: I would like to ask Mr. Casgrain, if it is contemplated by the Canadian Bar Association that the trained breathalyzer technician will also be trained in blood and urine tests in all cases so that he could handle all tests that may be requested by the accused, without taking the time to call in another expert?

Mr. CASGRAIN: No, that was not contemplated because we understand that the breathalyzer test is something which requires only a very limited amount of technical knowledge, while the urine test and the blood test require qualifications that are much more extensive.

Mr. RYAN: Was it contemplated by the Canadian Bar Association that our legislation should require the ability to test in all three fields be present at the testing site? Would all the facilities be there and all the experts be there contemporaneously?

Mr. CASGRAIN: No, because the man is entitled to get a sealed sample of his own blood and a sealed sample of his urine when he is arrested. At the same time that he gives a sample of his breath he is entitled, and he must be told that he is entitled, to receive samples of his blood and urine and those he can have analysed any time he receives them.

Mr. RYAN: Is there not a weakness in this particular area when you have a man who is intoxicated or on the borderline of impairment. He may be able to establish, if he could get these tests taken right away, that he was on the right side and be free that very night; otherwise he has to take good care of these samples of blood and urine, and how can he do it if he is kept locked up?

Mr. CASGRAIN: First of all, I would say that he should not be kept locked up unless he is in such a state of intoxication that it is not safe for himself and for others if he is released. People are not supposed to be locked up just for an offence.

Mr. RYAN: Suppose he is intoxicated by some means other than alcohol and there was an imperfection in the test on the breathalyzer?

Mr. CASGRAIN: Well then, he would have other evidence. He could have his own doctor testify as to his peculiar state of health which makes him appear intoxicated when he is not intoxicated.

Mr. RYAN: You do not see any possible chance of these two samples going stray in the hands of a man who has been arrested?

Mr. CASGRAIN: Perhaps the attorney general or the police authorities might provide that some system be established to safeguard the accused person. That would be the administration of the law.

Mr. RYAN: There may be an area of regulation needed there.

Mr. CASGRAIN: It might well be recommended to the authorities and they may do it.

Mr. RYAN: Is it the opinion of your association that if this were made the law of Canada that there would be quite a period of time before it would apply equally over the whole of Canada? In other words, would it be in effect in the cities or metropolitan areas more so than in the outlying areas for any considerable period of time?

Mr. CASGRAIN: That would quite likely happen.

Mr. RYAN: There is no doubt in my mind that the Canadian Bar Association asking the federal parliament to make this a crime in the Criminal Code, even though you speak of it as an offence, because in section five of your resolution you recommend, "That sections 222 and 223 of The Criminal Code be deleted and new section enacted creating a new offence of impaired driving only."

You are seeking that this be made, to put it bluntly, a crime on the statute books of Canada?

Mr. CASGRAIN: Yes.

Mr. RYAN: The only way we really have jurisdiction is to make it a crime even though we label it an offence?

Mr. CASGRAIN: You must distinguish between what is a crime and what is just an offence. In the old code we used to distinguish very carefully between a crime and an offence. Now we do not distinguish as much. There was a very distinguished committee, on which the father of one of the present members sat, which revamped the Criminal Code and made it much shorter and much clearer than it was. They did not make such a distinction between a crime and an offence. Certainly it should not be considered a crime even if it is in the Criminal Code; it is an offence.

Mr. COOPER: I think in the way that the courts have used the word "crime" that this is a crime. It is in the Criminal Code. It is not an indictable offence, it is punishable on summary conviction.

Mr. RYAN: It is a lesser crime.

Mr. COOPER: It is a lesser crime; it is a minor crime.

Mr. RYAN: That is probably a more accurate way of referring to it.

Mr. COOPER: Yes.

(Translation)

Mr. CHOQUETTE: It would be an infraction?

Mr. CASGRAIN: Yes, it would be an infraction.

Mr. CHOQUETTE: But it would not be a criminal offence?

Mr. CASGRAIN: That is right.

(English)

Mr. RYAN: Mr. Chairman, I would like to question the Canadian Bar Association in connection with section 1(a) of the resolution where it speaks of ".8 parts per thousand of alcohol in venous blood". Why does the Canadian Bar Association want the word "venous" in there?

Mr. CASGRAIN: That is what the doctors have told us.

Mr. RYAN: It may have been by Dr. Ward Smith himself.

Mr. CASGRAIN: There is venous blood and arterial blood, I think.

Mr. RYAN: Yes, possibly some other member of the committee might have a better recollection of this than I have, because I believe I had to leave for a short time at the time it was being discussed, but did not some witness say that the word "venous" should not be in Mr. Mather's bill? If so, perhaps it should not be in the resolution of the Canadian Bar Association either.

Mr. MATHER: I do not recall that, sir, but I took my "venous blood" regulation from what the doctors recommended too.

Mr. RYAN: I will check into that. That is all. Thank you.

Mr. WAHN: Mr. Chairman, it appears that the resolution of the Canadian Bar Association recommends the creation of a new offence, which is the offence of driving with an excess of blood alcohol level, to be determined by a breathalyzer test conducted by a properly qualified technician. The witnesses will no doubt correct me if I am wrong, but I did get the impression from what has been said that in some areas of Canada breathalizers will not be immediately available, or perhaps there will be an even greater difficulty in obtaining properly qualified technicians.

Did the committee of the Canadian Bar Association give any thought to the question of whether this would mean that what is a crime, in effect, in one area of the country is not a crime, in effect, in another? If that is so, is this a basic objection to the creation of a new offence, bearing in mind the fact that ordinarily we assume that criminal laws should be equally applicable to all citizens and not just to those living in the larger cities where the breathalyzer is more readily available.

Mr. CASGRAIN: Our committee did consider it and felt that the balance of convenience was on the side of it being better that a few people would not be prosecuted than there be no proper deterrent to a person driving with alcohol in his blood.

Mr. WAHN: Is it similar to the offence of driving at an excessive rate of speed? I suppose in remote areas it is easier to get away with driving at 70 miles an hour than it is driving down Yonge Street in Toronto or St. Catherine Street in Montreal. Is it the same principle?

Mr. CASGRAIN: The principle of the suggested law is exactly the same as driving beyond a certain speed limit.

Mr. WAHN: Is it technically possible to take a sealed sample of breath, blood or urine and keep it for some time and then make the test, or will the sample deteriorate or change? In other words, can a test of breath, blood or urine be carried out accurately a considerable length of time after the sample has been taken or must it be conducted right away?

Mr. CASGRAIN: I suppose our committee has satisfied itself on that by making inquiries of the medical profession, but perhaps your committee would wish, and quite rightly so, to submit that same question to the Canadian Medical Association.

Mr. COOPER: Mr. Chairman, my information is gleaned from reading debates within our own association and I know that a period of twelve hours was there advanced—I think authoritatively—during which a breath sample could be analysed accurately. It runs in my mind the period may be longer than that, but that period of twelve hours was very definitely accepted as a minimum. I do not know about blood and urine. I think almost indefinitely, but I have no direct knowledge of it and undoubtedly that information could come from medical people.

(Translation)

Mr. LATULIPPE: Mr. Chairman, according to the reports and to the evidence we received last week, it was demonstrated that accidents caused by alcohol were not very large in number and constituted a rather small percentage of the whole. Is it really worth our while to amend the Criminal Code only because certain individuals might have been drinking too much? Further, you apparently want to subject some people to tests. It could be proved, I believe, that a large number of accidents have been caused by people who have absorbed alcohol without these accidents necessarily being due to alcohol. These accidents would have happened, alcohol or not. These people are to be accused for reasons which are not justifiable. Because a man has absorbed alcohol, he is being punished. He is being brought before the courts. He is fined, he is subjected to all kinds of penalties, and yet a large number of accidents happen to people who have not taken any alcohol. This person, on the other hand, who has had alcohol, will be punished if he is submitted to the test and found to have an alcohol content in his blood even though alcohol has nothing to do with the accident. There is something unfair, it seems to me, in this regard. The average increases in risk.

(English)

Mr. COOPER: The average risk of being involved in an accident for drivers as a whole increases as the concentration of alcohol in the blood rises beyond about .04 per cent.

(Translation)

Mr. CASGRAIN: There are various questions here. The first question is rather an affirmation with regard to statistics. Of course, you can draw all kinds of inferences from statistics, but no doubt you have examined the White Paper put out by the United Kingdom Parliament in December 1965. In this White Paper, the Minister of Transport of the United Kingdom Government indicates the reasons why he favours the adoption of legislation of the type at present under discussion. You find there a chart which appears to be very impressive indeed. It relates to the average increase in risks.

(Quotation in English by Mr. Casgrain as follows: "The average risk of being involved in an accident for drivers as a whole increases as the concentrations of alcohol in the blood rises beyond about 40 in 10,000...")

(Translation)

We have a very impressive chart here relating to the increase in accidents. Now, even if statistically we were to say that out of 100 accidents only 20 people are killed and 50 and injured, are we to set at a level of 50, 10 or 100 the percentage of killed and injured necessary to make the breathalyzer test mandatory? Where are we going to stop to determine if the inconvenience to which the individual is being subjected in such that it must override the deterrent effect of the test? If we have one accident out of one thousand, one accident out of one hundred, this is a relatively considerable proportion to begin with. I think this is not so much a statistical matter. The matter should be weighed on another scale. We should be thinking here of rights and violations of rights. My rights stop where your rights start.

Mr. LATULIPPE: Last week one of our witnesses demonstrated to us that the percentage of car accidents brought about by alcohol was rather minimal.

Mr. CASGRAIN: It might be minimal compared to others but it might be considerable per se. Absolutely it might be large. We are beginning to discover—and you probably will have studied that I have no particular knowledge in this matter; I speak only of what I know that far more accidents are caused by mechanical defects in cars, faults in the brakes, steering mechanism, etc. These bring about accidents. They have not been discovered, you drive along, and then suddenly there is some unexplained failure. How many accidents are brought about by mechanical defects? How many accidents are due to fatigue, how many are due to so many other causes? We really do not know, but I do not think we should be seriously or, at least overly influenced by statistics when we are dealing with human rights. All the statistics we have show us, show lawyers especially, that we have a large number of fatal accidents brought about by alcohol. We really do not know the actual number, but we know that there are a lot of them.

Mr. LATULIPPE: However, my point is that a lot of accidents are attributed to alcohol even though this is not a point which has been established beyond doubt even though some alcohol has been absorbed.

Mr. CASGRAIN: It might not be the *causa causans*.

Mr. LATULIPPE: Well, we have road conditions, we have dangerous parts of roads, etc.

Mr. CASGRAIN: But even if the road is in a poor conditions, the driver who is perfectly sober will have better reactions. He will be better able to adapt to these road conditions. He will react more quickly if he is sober than if he has been drinking.

Mr. LATULIPPE: But could not the Canadian Bar Association do something to educate the people, to attempt to do away with various causes—

Mr. CASGRAIN: You can hardly imagine to what extent our Association's time is taken up with various surveys regarding amendments to laws. Our appearance

before the committee to-day is only one indication of the interest we have in these legal problems. As far as sociological problems are concerned, I believe it would be best to leave that matter to those most competent to deal with it.

(Translation)

Mr. LATULIPPE: But we might indicate to the people that there are some causes that have been unsuspected so far. Perhaps you could be dealing not only with penalties, but with preventive action.

This resolution of ours provides for preventive action.

(English)

The CHAIRMAN: Well, I hesitate to interrupt, but it is now one o'clock, about half an hour past our usual adjourning time. We have a lot of questions.

I will stay as long as the members of the Canadian Bar Association are willing to answer any questions that members may wish to ask. Make them short.

Mr. MATHER: Mr. Chairman, I have two questions which will take about 30 seconds. Just to clarify matters in my own mind, I want to ask this. Is it correct to say that the Canadian Bar Association is seeking to establish in law a blood alcohol level—and they recommend .08 per cent—above which it would be against the law to drive a vehicle and that they would make a test for that mandatory on the breathalyzer basis, and that they have satisfied themselves that there is no impairment or infringement of civil liberties involved.

Mr. CASGRAIN: Yes.

The CHAIRMAN: Any more questions?

Gentlemen, before we adjourn, first of all very briefly I would like to thank Mr. Casgrain, Mr. Cooper and Mr. Merriam for their presence here today, for their presentation and for the very clear and comprehensive way in which they have answered the many questions which have been directed at them.

Just before you go, gentlemen, I would like to have a motion that the submission of the Canadian Bar Association be appended to today's proceedings and probably the mover and seconder might include in that the resolution which Mr. Casgrain has handed to me and which is certified by the secretary as the resolution of the Canadian Bar Association, that it be an exhibit so that the validity of the resolution can never be questioned.

Motion agreed to.

Appendix 8

CANADIAN BAR ASSOCIATION
RESOLUTION

"The Canadian Bar Association recommends legislation as follows:

1. Making unlawful the driving of a motor vehicle by a person with a blood alcohol level to be fixed by the legislation provided,
 - (a) that the level should not be less than .08 per cent or .8 parts per thousand of alcohol in venous blood;
 - (b) that the blood alcohol level be determined by analysis of breath, which shall be *prima facie* evidence only;
 - (c) that the accused is offered a sample of the material to be tested to determine the level;
 - (d) that the analysis on behalf of the Crown Prosecution is conducted by a duly qualified technician; and
 - (e) that the accused must be afforded the opportunity to cross-examine everyone who takes part in the taking of the sample and analysis of it including the person who is responsible for the maintenance of the equipment used in the analysis.

2(a). Making it an offence for any person to refuse without cause to give a sample of breath when required to do so by any law enforcement officer who has reasonable and probable grounds for believing that such person has committed an offence.

(b) Making evidence of the test so conducted admissible upon the charge set out in 1 above or upon a charge of impaired or drunk driving.

3. The person whose conduct is being investigated shall be advised that at his request he is entitled to be given a sealed sample of his own blood or his own urine at the time any other test is conducted.

4. That the offences recommended above be punishable on summary conviction only and that the penalties therefor shall be as for a first offence on impaired driving with no minimum penalty but with the power to prohibit driving on the highways in Canada in the course of any period not exceeding three years.

5. That Sections 222 and 223 of The Criminal Code be deleted and a new section enacted creating a new offence of impaired driving only."

- - - - -

Certified a true copy of a Resolution passed by The Canadian Bar Association at its Forty-Eighth Annual Meeting in Winnipeg, Manitoba on August 30, 1966.

Ronald E. Merriam.
Secretary.

Appendix 9

FEBRUARY 19th, 1965.

REPORT OF SPECIAL COMMITTEE ON
BLOOD ALCOHOL AND IMPAIRED DRIVING

(By P. D. Isbister)

As Chairman of this Committee I now beg to report on its deliberations and to submit its recommendations.

COMPOSITION OF COMMITTEE

The Committee was as follows:

His Honour Judge Harold W. Pope, District Judge, Moose Jaw, Saskatchewan.

His Worship Magistrate S. Tupper Bigelow, Q.C., Toronto, Ontario.

Walter C. Newman, Q.C., Winnipeg, Manitoba.

A. Stewart McMorran, Q.C., City Prosecutor, Vancouver, British Columbia.

Hazen Hansard, Q.C., Montreal, Quebec.

John T. Weir, Q.C., Toronto, Ontario.

P. D. Isbister, Q.C., Toronto, Ontario.

TERMS OF REFERENCE

This Committee was appointed after The Canadian Bar Association was asked to consider the following recommendation of a Committee of The Canadian Medical Association:

"Your Committee specifically recommends legislation which will—

1. Recognize the breathalyzer test, carried out by properly trained technicians, as an accurate method of determining blood alcohol levels, and that the results of this test be admissible as legal evidence.

2. Make it unlawful to drive a motor vehicle with a blood alcohol level of more than .05 per cent.

3. Make a submission to the breath test mandatory when requested by law enforcement officers."

(See Canadian Medical Association Journal September 1, 1962, Volume 87, Article 218)

Your Committee has understood its task to be as follows:

(a) To consider the evil to which the existing and proposed legislation is directed, i.e. death, personal injury and property damage caused by the impairment by alcohol of ability to drive a motor vehicle.

(b) To consider the adequacy of the existing legislation.

- (c) To weigh the merits of The Canadian Medical Association recommendations.
- (d) To ensure that any proposed legislation shall not work an injustice to or constitute an undue invasion of the rights of the individual to fair and equal treatment before the law.

EXISTING LEGISLATION

Your Committee considered the existing legislation bearing in mind the principle that if it is not necessary to change, it is necessary not to change. The appalling statistics of accidents on the highways of Canada persuaded the Committee that it is imperative that there be a new legislative approach. Needless to say the extensive material which the Committee considered reveals that there are a number of other causes of accidents on our highways and that alcohol is by no means the only culprit. However, those other matters were not within the terms of our reference.

The existing legislation and in particular the impaired driving section is giving rise to an ever increasing number of convictions. This trend may reflect favourably on our law enforcement agencies but it demonstrates that the legislation is not achieving the desired result, namely a lower incidence of driving while impaired. Your Committee believed that it should concern itself with measures which would achieve the latter end and not merely give rise to more cases in our Courts.

Section 223 of The Criminal Code makes it an offence to drive a motor vehicle while the ability to do so is impaired by alcohol. Your Committee believes that the inherent defect in that section is that few people will admit to themselves that their ability to drive has been impaired; the problem is compounded by the fact that their judgment of their ability to drive in those circumstances is affected by the alcohol consumed. To reduce the incidence of driving while impaired, legislation should be deterrent and not merely punitive. Your Committee is therefore of the opinion that effective legislation must create an atmosphere in which the decision will be not to drive in such circumstances. We therefore believe that there must be a new concept unrelated to ability to drive or the confidence of the driver in such ability.

THE BLOOD ALCOHOL LEVEL OFFENCE

The Canadian Medical Association recommendation is that Parliament make it unlawful to drive a motor vehicle with a blood alcohol level of more than a fixed percentage. There is ample precedent for this in other jurisdictions. In some the blood alcohol level raises a rebuttable presumption and in others it is conclusive of guilt. As to the former the issue is still one of impairment; thus, the question facing the driver who has been drinking remains as it is today, and the atmosphere of decision is the same. On the other hand if the sole issue before the Court is the blood alcohol level without regard to, or the need for proof of, impairment, then a much different question is presented to the individual who has been drinking and who has to decide whether or not he should drive his car. He does not have to admit to himself or to his friends that his abilities have been impaired. On the contrary everyone can readily learn the rule of thumb for calculating whether or not he is going to be in breach of the law.

We recognize that this offence draws an arbitrary line. We think that there is an analogy in the same field, i.e., the speed limits on our highways. We believe that the public would and indeed must be educated to accept a similar arbitrary limit of blood alcohol level and we believe that fixing such a limit at an appropriate level is not asking too much, having regard to the interest of the community as a whole.

THE RIGHTS OF THE INDIVIDUAL

Having accepted that it is the peculiar responsibility of the Bar Association to ensure that the rights of the individual are not unduly affected, your Committee propounded to itself three questions as follows:

1. Would the enactment of the blood alcohol level offence work an unwarranted injustice or an undue invasion of the rights of the individual to fair and equal treatment before the law? Your Committee was of the opinion that this question is to be answered in the negative.

2. Can there be a fair trial of the issue which would be before the Court in a prosecution for such an offence? Your Committee is of the opinion that, assuming certain safeguards referred to later, there are existing means for determining blood alcohol level and that therefore this question is answered in the affirmative.

3. What safeguards are essential? Any endorsement by your Committee of a blood alcohol level offence is predicated on there being adequate safeguards of the rights of the individual and these we consider to be as follows:

- (a) In determining blood alcohol level the principal tests have used specimens of breath, blood and urine. The blood test would constitute an unwarranted and unjustified trespass of the person. Urine is considered by the authorities in the field to be too unreliable to form the basis of conviction. On the understanding that blood alcohol level can be reliably determined by analysis of breath sample and that modern techniques make it possible for the accused to be given a sample of breath which he may take with him for an analysis by an analyst of his choice, your Committee is prepared to accept the breath test but it requires that the accused be offered a sample of the breath which is to be tested by the prosecution.
- (b) The analysis for the prosecution must be done by a duly qualified technician.
- (c) The accused must be afforded the opportunity to cross-examine everyone who takes part in the taking of the sample and analysis of it including the person who is responsible for the maintenance of the equipment used in the analysis.

THE BLOOD ALCOHOL LEVEL

Your Committee believes that an unreasonably low level would constitute an unwarranted and unjustified invasion of the rights of the individual. On all the material before it, your Committee is of the opinion that the level should not be lower than .1% or 1.0 parts per thousand of alcohol in venous blood.

HAVING THE CARE OR CONTROL OF A MOTOR VEHICLE

While your Committee is prepared to endorse legislation making it an offence to drive with a blood alcohol level of a given amount, it is of the opinion that such legislation should be confined to driving and should not include having the care and control of a motor vehicle in such circumstances.

PENALTY

Your Committee is of the opinion that the penalty for the blood alcohol level offence should be not more than the maximum for a first offence of impaired driving without the minimum prescribed therefor and that in addition the Court ought to be at liberty to make an order prohibiting the accused from driving a motor vehicle on the highways for any period not exceeding three years. Your Committee is further of the opinion that the offence should be punishable on summary conviction only.

COMPULSORY TEST

Your Committee recognizes that concurrent with the enactment of a blood alcohol level offence there must be legislation providing for a compulsory test. There must therefore be a penalty attaching to the refusal to provide a sample for such a test when reasonably requested so to do. Your Committee is of the opinion that the penalty should be the same as for impaired driving as any lesser penalty would in the circumstances be an inducement to refuse. However, your Committee requires that great care be taken in drafting legislation creating such an offence and that the rights of the individual be protected by the following provisions.

- (a) The law enforcement officer who requires that a sample of breath be provided must have reasonable and probable grounds for believing that the accused has committed an offence.
- (b) The refusal to provide the sample must be without cause.

DRUNK DRIVING AND IMPAIRED DRIVING

At its 44th Annual Meeting at Halifax on September 1, 1962, The Canadian Bar Association resolved by a majority vote that Sections 222 and 223 of The Criminal Code relating to drunken driving and impaired driving respectively, be deleted and a new section enacted creating a new offence of impaired driving only. Your Committee desires to say that its recent examination of the question referred to it persuades it that that resolution was a sound one but it recommends that there be no minimum penalties attaching to that offence.

SECTION 224 (4)

In the course of its deliberations your Committee considered a suggestion that this sub-section be deleted having regard to its proposal that compulsory test legislation be enacted. Your Committee is of the opinion that the rule that the refusal to take a test or give a sample is not admissible in drunk or impaired driving proceedings ought not to be disturbed and that evidence of such refusal should be admissible only in support of a charge of refusing to give the sample.

RECOMMENDATIONS

Your Committee therefore recommends legislation as follows:

1. Making it unlawful to drive a motor vehicle with a blood alcohol level to be fixed by the legislation provided.

- (a) that the level should not be less than .1% or 1.0 parts per thousand of alcohol in venous blood,
- (b) that the blood alcohol level be determined by analysis of breath only,
- (c) that the accused is offered a sample of the material to be tested to determine the level,
- (d) that the analysis on behalf of the Crown Prosecution is conducted by a duly qualified technician, and
- (e) that the accused must be afforded the opportunity to cross-examine everyone who takes part in the taking of the sample and analysis of it including the person who is responsible for the maintenance of the equipment used in the analysis.

2. Making it an offence for any person to refuse without cause to give a sample of breath when required to do so by any law enforcement officer who has reasonable and probable grounds for believing that such person has committed an offence.

3. That the offences recommended above be punishable on summary conviction only and that the penalties therefor shall be as for a first offence on impaired driving with no minimum penalty but with the power to prohibit driving on the highways in Canada during any period not exceeding three years.

4. That Sections 222 and 223 of The Criminal Code be deleted and a new section enacted creating a new offence of impaired driving only.

Your Committee desires to acknowledge the co-operation afforded it throughout its deliberations by Ronald C. Merriam, Q.C., and your Chairman concludes this report by expressing his appreciation of the co-operation of all members with him and with each other.

All of which is respectfully submitted.

Mr. Otto,
Mr. Ryan,
Mr. Scott (*Danforth*),
Mr. Tolmie,
Mr. Trudeau,
Mr. Wahn,
Mr. Woolliams—24.

(Quorum 10)

Timothy D. Ray,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

THURSDAY, November 3, 1966.
(19)

The Standing Committee on Justice and Legal Affairs met this day at 11.15 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Cameron (*High Park*), Choquette, Forest, Guay, Honey, MacEwan, Mather, McCleave, McQuaid, Ryan, Tolmie (11).

In attendance: Dr. I. M. Rabinowitch, O.B.E.

The Chairman introduced Dr. Rabinowitch, who made a statement regarding Bill C-87.

At the conclusion of his statement, he was questioned by the Committee.

*Agreed,—*That the graph illustrated by Dr. Rabinowitch showing comparative results from analyzing the amount of alcohol in arterial and venous blood, be appended to today's proceedings. (*See Appendix 10*)

The Chairman thanked Dr. Rabinowitch for his valuable contribution to the Committee's proceedings.

At 1.10 p.m., the Committee adjourned to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

THURSDAY, November 3, 1966.

The CHAIRMAN: Gentlemen, I see a quorum. We have with us this morning Dr. I. M. Rabinowitch who we will have the pleasure of hearing. The effects of alcohol on the blood fall in the medical field of metabolism. The Ontario College of Physicians and Surgeons calls Dr. Rabinowitch "a renowned authority in the fields of metabolism and diabetes". A medical graduate of McGill, he served in the army in world war I, and joined the University's medical faculty in 1922. In 1921 he organized and was director of Montreal General Hospital's department of metabolism and clinic for diabetes, posts he held until 1947.

He made a study of the metabolism of eastern arctic Eskimos for the government in 1935. In 1939 he was sent to England to organize a chemical-warfare, mobile laboratory for the detection of poison gases for the Canadian army. He was later scientific advisor for the defence against gas warfare in Canada. For these services the late King George VI awarded him the Order of the British Empire.

Dr. Rabinowitch is a Fellow of the Royal College of Physicians of Canada and of the American College of Physicians. McGill awarded him a Doctorate of Science, the 25th such degree awarded by McGill in a century.

Without further ado, allow me to introduce Dr. I. M. Rabinowitch, O.B.E.

Dr. I. M. RABINOWITCH, O.B.E. (*Retired*): Mr. Chairman, gentlemen, I regard it as an honour indeed to be invited to present my views to you on a matter which concerns administration of justice in our courts of law.

I am particularly pleased to be here because I shall have the opportunity to present my views in my own way and which, as you know, most of you being of the law profession, is not always permitted under the laws of evidence in a court of law.

A trial, as you all know, is not—and by its very nature cannot possibly be—a scientific investigation, because whatever the issue is before the courts, be it criminal or be it civil, the issue is fixed, and, therefore, since the issue is fixed, the questions counsel may ask the witness are fixed, and what the witness may say in reply is fixed.

This is not the way truth is arrived at in science. Now, gentlemen, were you all physicians, and not only physicians but authorities on what is known as human metabolism, I am quite certain that I could, in a very few minutes, prove to you, beyond all reasonable doubt, that the breathalyzer, or any other breath test, has no place in a court of justice, whether it is a breathalyzer, as I have said, or whether it is any other breath test, because we must recognize that Bill No. 6-87 merely mentions "breath test". It does not specify any particular breath test. However, I am quite satisfied that in the end I shall be able to show what I wish to show.

I wish also to say at the outset that I do not intend in the least to enter into any theoretical discussion, because for this there is neither the time nor is this the place. I propose to deal entirely with incontestable facts—facts proven through the years in the best laboratories that one can mention.

I should also say at the outset—and some of you are not acquainted with the fact—that I am almost entirely alone in Canada in opposing breath alcohol tests. I believe that there is one exception only, and by coincidence he also happens to be a professor of medicine, whose specialty also happens to be internal medicine and whose field happens to be metabolism. This is Dr. Max Cantor of Edmonton.

Again, not to confuse the issue, let me say at once that as a machine for the detection and quantitative examination of alcohol there is nothing wrong with the breathalyzer, or with any other test; that is, if I were to take a sample of air from this room and were I to add a known amount of alcohol you could detect that amount of alcohol with reasonable accuracy—at least with the accuracy sufficient for medico-legal purposes. But here we are not concerned with a sample of air from this room; we are concerned with the breath of a human being, which, as we shall see shortly, is an entirely different matter.

Also to clarify the picture, and not to become involved unnecessarily, I also wish to say that statistically there is nothing wrong with the breathalyzer or any other breath test. If I were to take a sample of blood from every person in this room after he has had a drink of alcohol, and I determine the amount of alcohol in the blood and then simultaneously determine the amount of alcohol in the breath, the average of the blood would agree quite closely—certainly sufficiently for medical-legal purposes—with the alcohol in the breath. Breath and blood would agree statistically. But being lawyers, you will appreciate that the problem in a court of law is not a mass of statistics; the problem is a particular person who, it is alleged, had had in his blood a particular amount of alcohol at a particular time. It is in the individual, as I propose to show, that the test breaks down and breaks down very badly.

It may only take about two or three minutes, but a brief historical background of the development of this test is important, as we shall see later in its application.

Breath tests, gentlemen, or any other chemical tests, are by no means new. The first attempt to use one in a court of law dates back to 1930, and, in fact, was used in Sweden in courts of law at that particular time; and they used blood tests, urine tests, and so on. But, gentlemen, long before there was any such thing as a traffic problem, long before anything was known by medical-legal experts about blood alcohol, it became a very important problem in the management of the diabetic. At that time—this was before the days of insulin which, incidentally, dates me pretty well—the situation of the severe diabetic was very tragic. If he did not follow treatment he died of diabetic coma. If he followed treatment he died of starvation. But he died.

Then it was discovered that alcohol was the one substance that a diabetic could use 100 per cent efficiently. He could get 100 per cent of his calories. It did not take us very long to find out, though, that, although it was good as a food, it could be very harmful, but at that time we knew very little as to why it could be harmful. We knew what damage it was causing, but we did not know how it was

caused. We therefore had to thoroughly investigate the whole situation of alcohol: In what manner it is absorbed from the stomach and intestines into the blood; the rate of its absorption; the way it distributes itself in the particular organs in the different parts of the body; the way the different organs utilize it; and the way it is eliminated; and, in fact, gentlemen, the statistical relationship between the level of alcohol in the blood and the degree of intoxication was known exactly 100 years ago, in 1866.

Because of all of this information it was necessary to test various body materials for alcohol, and the test for the breath dates back to 1891. Although today, as I said, for medico-legal purposes, one can do the test with an error of about five or ten per cent—that is alcohol from the atmosphere, not from the breath—we had to devise methods, gentlemen, by which the permissible error was not more than one one-hundredth of one per cent. With an accuracy of one in 10,000 we had to determine what was going on within the body.

I am going to hand this around just to show you gentlemen the types of machines we used. One is from Cornell University used fifty years ago, and the other happens to be my own device at the Montreal General Hospital, used exactly 40 years ago.

That gives us the background, and we are going to see what that background is going to mean. It is going to mean this, gentlemen—and this has been my problem throughout the last quarter of a century in courts of law: It involves chemistry; it involves physics; it involves physical chemistry; it involves physiology; it involves physiological chemistry; pathology; pathological chemistry; toxicology and chemico-medicine. There is no question that the experts that we have—and this is no derogation here; I have the greatest respect for every one of these men—are highly authoritative in their own particular fields—there is no question about that at all—but with one one exception, out west, there is not a single one in Canada who is an authority on metabolism of alcohol in the human body. They are authorities on pharmacology, as it concerns alcohol, authorities in biochemistry as it concerns alcohol, or on physiology, or pathology.

The problem is the same in the United States. The National Safety Council of the United States has a special committee on chemical tests for intoxication; which consists of seven men, gentlemen, of whom one only happens to be a physician. And he happens to be a pathologist. Undoubtedly, it is a very important field in medicine—we could not do without pathologists—but pathology is one aspect only.

With that background, let us consider the tests. Basically, I think we can forget the breathalyzer. Let us speak in terms of "breath tests," because this bill before you, gentlemen, does not specify any particular breath test, and, in fact, in the vast majority of cases, the breathalyzer is not as yet used.

The man who invented the drunkometer, Dr. Harger, in 1938, still prefers the drunkometer to the breathalyzer. He published an article only recently. It just so happens, though, that whichever test we use, basically they are all on the same principle, whether it is the drunkometer, or the alcometer, or the intoximeter, or the breathalyzer, or any other test. It is based on a particular principle, and I want to quote it verbatim because we are going to have to stress almost every word of this later on. I am now quoting the original article on breath tests by Dr. R. N. Harger. It is his drunkometer. "The basic principles underlying all

breath alcohol tests is that there is a constant"—and underline that word "constant"—"there is a constant ratio between the rates of alcohol per unit volume of blood and alveolar air". Alveolar air simply means the air from deep in the lungs. Therefore, in all cases there is a constant ratio. Well, naturally, if there is a constant ratio and if I know what there is in the breath I should know what there is in the blood. With this constant ratio, Dr. Harger comes to this conclusion from his data. "The data show"—I am quoting verbatim—"in practically all of the cases the figures obtained for the breath and for the blood gave essentially the same information." We certainly could not want any more definite statement than that.

The National Safety Council of the United States stresses that principle. Again, I quote verbatim. "The basic principle governing the operation of the drunkometer, the intoximeter and the alcometer" and so on, "is the constant ratio existing between the concentration of alcohol in the alveolar air and blood, approximately 1 in 2100," or 2000 in round figures.

In 1958, Dr. Ward Smith again repeated the same statement with regard to the breathalyzer. I now quote Dr. Ward Smith verbatim. "One part of alcohol contains the same amount of alcohol as 2100 parts of air." You cannot have any more definite a statement than that.

I have a statement here from a Dr. Lockerby. He was a medical legal expert for the Crown in Saskatchewan, but I think the less said about him the better. I doubt very much whether this man will ever again testify in a court of law in Saskatchewan by the time I get through with him. The man was absolutely dishonest, so dishonest that before the trial was finished the Crown prosecutor dismissed him from the case. Here was the Crown prosecutor, in a case of criminal negligence, with nobody to assist him to cross-examine me. Then the next morning, to add to it, the Crown laboratories in Regina fired him.

We are down now to where we have a constant ratio, 2100 to 1, and, therefore, if you have a constant ratio, certainly if I examine the breath I should know what is in the blood.

Suppose, gentlemen, the ratio is not a constant ratio. Suppose the ratio could be 1200 to 1, instead of 2100 to 1. Here you would have an enormous error. A level of .8, which is in the bill, would now become .6, or something like that. We must see where they got this constant ratio from, and they all quote, without a single exception—the intoximeter, the drunkometer, the breathalyzer—they all quote two authorities of Stockholm, physiologists, called Liljestrand and Linde whom you will perhaps just remember by "L and L", for short. They quote Liljestrand and Linde as having said that the 2000 to 1 is a constant ratio.

Gentlemen, it is obvious to me that there is not a single one of these experts who could have ever read carefully, or read at all, L and L's paper, because I have L and L's paper here. What Liljestrand showed, which, in fact, we found two or three years, I think, before Liljestrand—was that the ratio only applies after all of the alcohol has left the stomach, has been absorbed into the body, has reached the maximum concentration and is now being eliminated from the body. The importance of that we shall see later. Therefore, it is not a constant ratio; it is only a constant ratio at a particular time after.

Now, what is the ratio before that? The ratio, gentlemen, before that shows that you can have a 300 per cent error.

In other words, if I catch the breath of, say, a man who had a drink and was arrested fifteen to twenty minutes afterwards, and find .8 in his breath, gentlemen, that breath might be only .2 parts. We are going to come to specific figures later on.

Therefore, they all only partly quoted Liljestrand paper. If any of you gentleman wishes to see it it is here. It is the original, in German. This is what he showed—that there is a constant ratio of 2000 to 1 in round figures, but it applies only after all the alcohol has left the stomach, has passed into the blood, has reached its maximum concentration in the blood and is now beginning to disappear from the body. If you catch it before that period the error may be as high as a 50 per cent error, or a 100 per cent or a 200 per cent error or a 300 per cent error.

Dr. Linde's article was published in 1930 and this happens to be some of my own data published in 1928 or 1929.

The question, therefore, gentlemen, that we should ask ourselves here is: How then do we explain Dr. Harger, an outstanding pharmacologist, one of the most careful experimenters in the United States—how do we explain his conclusion, his observation, that in practically all cases the ratio is constant.

What I propose to show, gentlemen, is that his conclusion does not agree with his own data. Again I want to emphasize the difference between reading an author's conclusions and reading his data. Personally, I would never pay any attention to anybody's conclusion. I want to see the man's data.

Here is what some of his data show, gentlemen. For example, where the blood showed .7 parts per thousand, the breath showed 1.2 parts per thousand; where the blood showed .8 parts per thousand, the breath showed 1.4 parts per thousand, and so on. This occurred, gentlemen, in 10 of 121 subjects. In other words, the test broke down badly. Notwithstanding his conclusions, but his own data—and I have the article here for anybody who wished to see it; this is Harger's original paper—the test broke down in 1 in 12 cases. As lawyers, you might ask yourselves this question: Where would you be today with fingerprints if one person out of every 12 has the same fingerprint? I have no objection to the .8, if it is permitted to obtain the .8 by the breath.

I have taken Dr. Harger's 121 cases and amongst them, gentlemen, 11 showed blood less than .8. Of these 11, 5 showed not .8, but .9, 1.2, 1.2, 1.4, 1.4. In other words, according to the blood tests, these people would not even have been charged. According to the breath test of all five of these eleven would have been convicted.

Incidentally, gentlemen, there is another point here. Probably it is presumption on my part being merely a doctor and not a lawyer, but I do not think that the bill is clearly stated. If you look in one part of the bill it says that you can be charged when you have .8 in the blood. On the opposite page, in the explanatory note, it says more than .8. Now, which is it? To me, that is not precise. I may be wrong. It makes a big difference if I am not allowed to exceed 30 miles an hour with my car or to exceed 29 miles an hour with my car. You see on one side it says .8 and on the explanatory note—

The CHAIRMAN: Do you want to answer that, Mr. Mather?

Mr. MATHER: The proposed change in the Code specifies a level of .08 per cent as being evidence of the ability of the said person impaired. The explanatory note as the doctor points out says "more than .8 per cent". I see no error involved in it. The basic point is the level of .08 per cent. Actually if you have more than .08 per cent you would still be—

Mr. RABINOWITCH: Oh, you would not be convicted on .8?

Mr. MATHER: Yes, you would. That is just what I am saying. If you have more than .8 you would—

Mr. RABINOWITCH: Oh, naturally you would be convicted.

Mr. MATHER: All right.

Mr. RABINOWITCH: So .8 is the conviction point.

Mr. MATHER: Right.

Mr. RABINOWITCH: Before we go any further, gentlemen, I have no objection to the .8. For many years, I have been trying to get it down to .4, because although I have seen persons in no way impaired with twice .8 and three times .8, I have seen quite a lot of people impaired with .8. For many years I have been trying to get this level down to .4 and to .5. I suggested it, I recall, at a murder trial, and suggested that to Dr. Ward Smith in Sudbury, many years ago. Although I have always wanted to see that level made a statutory offence beyond that as impairment you are going to have the battles all over again between medical and legal experts. I get up and say well I have seen people with twice that much and they were not impaired. Then one man gets up and he is on the other side, and he says he has seen people and they are impaired.

I am talking as a doctor now, and you will have to make allowances for my shortcomings, but the way I see it is this—and I have been saying this to judges and to magistrates and to lawyers for 25 years: The Queen says to me that I can walk on any street in Ottawa as much as I like, providing I do not make a nuisance of myself; but she also says to me that I am not to walk on any street with a loaded pistol in my pocket. Why not, in the legislation, make it a statutory offence to have that much alcohol in your blood? Do not bring in the point of whether it is impairment or not. Make it a statutory offence and then there is no problem; because this is not going to solve the problem of medical-legal experts. They are going to have battles all over again.

Mr. MATHER: Mr. Chairman, I would like to comment on that point.

As the committee members will recall, we had testimony the other day from the Canadian Bar Association, and they made that very suggestion. What we have here is the subject matter of my bill, and I, for one, would gladly accept your proposition, or that of the Bar Association, which I think is very much the same thing.

Mr. RABINOWITCH: Getting back now, gentlemen, here we have 5 out of 11 of Dr. Harger's own data—not data obtained by some police officer who has had a short course in operating a breath test machine, but Dr. Harger himself—of 11 people who had .8 per cent or less in the blood—I am sorry, less than .8; I did not know what that .8 meant—who had less than .8 in the blood had .9, 1.2, 1.2, 1.4 and 1.4. Again, gentlemen, if you take all of those 11 cases and average them

there is a remarkable agreement between breath and the blood. But, again, we are not concerned with statistics.

We start off with Dr. Harger's drunkometer. In 1950, Dr. Harger, for some reason or other, was not satisfied with his original method. He therefore decided to try to improve it, with the end result being exactly what it was then. I now quote from Dr. Harger's second paper, and I have it here before me if you gentlemen wish to see it. Here we have 49 experiments—49 subjects—showing less than .8 parts per thousand in the breath. Of these 49, gentlemen, 13 showed more than .8 parts per thousand. In fact, some of them showed more than 1 part per thousand; so he did not get very much improvement. Therefore, we are through with his first two drunkometers.

Then we come to a remarkable experience in 1956. Dr. Harger now succeeds in modifying his drunkometer. Between 1938 and 1956 eighteen years have elapsed, and all people in the United States with a statutory level of 1.5 have been convicted. In 1956, Dr. Harger finally succeeds in getting this modification. To show how he improves it, he now admits large errors—and those are his own words; I am quoting verbatim—"large errors" in 20 per cent, with his own drunkometer. Where is your constant ratio now of 2100 to 1. Then he is not satisfied and he now compares his new method with the intoximeter. With the intoximeter he gets large errors in 14 per cent. Then he compares his new method with the alcometers, and he gets 8 per cent. The article is right here if any gentleman wishes to read it.

He claims now only a 2 per cent error with his new machine. We shall come back to that 2 per cent. Now Dr. Harger has entirely changed his views. He talks no more about a constant ratio. He talks of the average. He is now using the word "average". I wrote Dr. Harger to ask him what he thought of the 20 per cent convictions with the drunkometer, with the alcometer and with the other. I never did get a reply to that letter.

We have now reached the stage where we have a better method, a more accurate method, of doing breath tests—and let us forget the 2 percent for the time being. It is undoubtedly a better method. We have now reached the stage where Dr. Harger himself admits that from 8 to 20 per cent large errors—"large" is his own word—with the other tests.

Shortly after that the Medical Research Council of Great Britain decided that they would see what the story was about these breath tests. They decided to test the drunkometer. Gentlemen, here is what they found. They found many other things, but we are only interested in this bill, and therefore, interested in this .8 figure. They did hundreds of tests, but amongst them 37 subjects showed less than .8 parts per thousand. Of those 37, 9, with the breath tests, showed much more than .8 parts per thousand. I do not think that I am in the habit of exaggerating—you certainly should not when you give scientific evidence—but, gentlemen, the reason I use the words "much more" is this, and here is the figures: In one case .59 parts per thousand—well below the point 8; with the breath test, 1.6 parts per thousand. Another case: .76 parts per thousand in the blood; 1.08 parts per thousand. Another case: .61 in the blood; 1.63 parts per thousand—more than twice the amount you need for conviction. Anyhow, to make a long story short, nine out of 37, one out of four, broke down in the Medical Research Council figures.

Dr. Harger is not yet satisfied. He is trying to go after something more accurate. In 1960 something occurred to him. It had been known for a long time—20 years before that—that when you give a person a drink of alcohol the alcohol level in the arteries will for a short time, be much higher than the alcohol level in the veins. I stress that point because the bill specifically mentions “vein”. You are going to convict the man on .8 in the blood in the vein, not the .8 in the blood in the artery.

We wanted to see what would happen if we gave persons alcohol, determined the alcohol level in arteries and in the veins. In a letter to me—I have the letter here—in 1964 he gave me his figures. He noted that up to half an hour after the ingestion of alcohol there may be as much as two and a half times as much in the arteries as there is in the veins. Forty-five minutes after ingestion of alcohol there may be 1.6 parts higher in the arteries than in the veins. An hour afterwards there may be 1.4 parts higher in the arteries than in the veins. Being, in a sense, laymen you might miss that point, and you might well ask the question: What do arteries and veins have to do with the blood test? It has this to do with it gentlemen. The level of alcohol in the lung air is determined by the level of the alcohol in the arteries, and not that in the veins. Now we are adding cabbages and cows and drawing conclusions from the results. You are going to convict the man on vein-alcohol and yet your test is reflecting artery-alcohol.

I am going to give you the actual figures from Dr. Harger. You give a man a drink of alcohol, and here is the .8 parts per thousand. It is roughly about .9 and then back to .8 and it is coming down. Now let us test the blood in the arteries. For the first hour there is much more in the arteries than there is in the veins, which means there is much more in the breath than there is in the veins. Your legislation is based upon the breath. Shortly afterwards, once the alcohol has reached the peak, and is now disappearing from the body, then the time comes when there will be less in the arteries than in the veins, and now your breath test will show a little bit less than in the blood. In other words, we are back to where we were at the beginning. Here is a perfect place to do a breath test. But for the breath test to apply medico-legally after you arrest a man you say to him: “When did you last have your drink. Has all the alcohol left your stomach. Has it reached the peak in the blood, and is it not on its way down? Because only now can we rely on the breath test”. Now, that is Dr. Harger’s own data. We will be coming to that shortly.

The reason, gentlemen, that we do not do arteries is because it is a very dangerous procedure. It is not practical. I did a lot of arterial punctures many years ago and I have two publications on it here, one from the British Journal of Experimental Pathology in 1927, and I have another one for the year 1928. We then learned that you cannot tamper with arteries to take the blood from the arteries in the wrist. Therefore, for practical purposes we have to use the vein. But if you are going to use the vein, and since, for quite awhile—at least for an hour—there is more in the arteries than there is in the veins, and since the breath is determined by the arteries and not by the veins, you are going to convict the man on artery and yet you are doing a vein test.

This now brings us to the breathalyzer which is our main concern now, I think, because although the bill does not specify any special breath test I think we will find that more and more breathalyzers will be used. Again, I cannot stress

too much that I have perfect confidence in the breathalyzer as a machine to determine alcohol in air. Where it breaks down is in the human being.

I want to quote to you claims for the breathalyzer, first by the man who invented the breathalyzer—Borkenstein. "Continuing experience has convinced the author that the breathalyzer reading will not be more than 0.1 per cent higher than the concentration in venous blood".

This is repeated in a police journal: "A remarkably high level of accuracy and consistency when checked against other breath methods."

Dr. Harger, who still likes his own drunkometer, is satisfied that the breathalyzer gives excellent results.

The Texas Department of Public Safety published their figures. They say: "The breathalyzer agrees in accuracy with the alcometer."

Dr. Wallace—we are not concerned with him. He is not a doctor.

I want to quote you verbatim what Dr. Ward Smith had to say about the accuracy of the breathalyzer: "The author has used it in upwards of 1,000 analyses in which readings from the breath were compared with readings from a saliva, urine and blood sample taken at the same time. In all "—I stress that "all"—"—in all cases the breathalyzer has been shown to be accurate within plus minus .1 per cent." That was published in the police journal for law enforcement officers and then it was repeated for lawyers in *The Criminal Law Quarterly*, making practically the same statement. The statement there is actually this: "Continuing experience with equipment have convinced the authors that the breathalyzer reading will not be more than 0.01 per cent higher than it should be except under certain extreme conditions." Again, gentlemen, we are dealing with a conclusion. We have not yet seen the authors' data.

The question therefore is: What do the data actually show? First of all, we have the data from the Texas Department of Public Safety. A statement is made here that the breathalyzer is as accurate as the alcometer. The question, therefore, is: How accurate is the alcometer? He did 36 comparisons between alcometer and blood. Of these 36 comparisons the blood showed less than .8 parts per thousand, and, of seven, five of them in the breath test showed more than .8 parts per thousand. If the breathalyzer is no more accurate than the alcometer, then here is your alcometer.

Here are more results of the alcometer. I have some here showing the relationship between blood and breath and again we see a large percentage of people having more in the breath, than they actually had in the blood. Therefore, if the alcometer has only that accuracy, and if the breathalyzer agrees in accuracy with the alcometer, clearly the breathalyzer itself has to break down; therefore, let us see actually exactly what the Department of Public Safety did find with their breathalyzer and here is what they found. They did not find a difference as Dr. Ward Smith said of no more than .1 parts per thousand, but in 34 experiments, they found a difference as much as .4 parts per thousand, .2, .3 and .4. Here is a complete contradiction, by their own data; their data does not agree with their conclusion or vice versa, if you like. Statistically, there is no question about it. The most remarkable agreement, when you average the whole 34 cases, breaths and blood agree almost perfectly. As I said before, we are not concerned with statistics, but with the man on trial.

We now come to the Medical Research Council of Great Britain. Let us see what they found with the breathalyzer. Here is what the Medical Research Council of Great Britain found and I will gladly leave this with you, if you would like to read some of it. In their investigation, the Medical Research Council of Great Britain conducted 59 experiments, 12 of which we are not concerned with in this Committee, because they are all higher than .8, but we want the figures below .8. Of these 59, 12 of them were above .8; therefore, our concern is only with 47. Of these 11 of the 47 or roughly 1 in 4, showed much higher in the breath than in the blood. In other words, you are back to where you were with the original drunkometer in 1938. Again, there was beautiful agreement statistically between the breath and the blood, which, seeing that we are all Canadians, brings us to the most important publication on the breathalyzer. I am now referring to the R.C.M.P. report on impaired driving tests.

As you probably all know, this investigation was used very widely in courts of law; in fact I had it thrown at me not so long ago, although the counsel regretted having thrown it at me. When I got this report, I knew no more about it than you gentlemen did before you heard about it. In glancing through it, I became suspicious of it for a number of reasons. First of all, in these experiments, these people are supposed to have received a definite amount of alcohol according to their body weight. Here is what I found out: Body weight 212 pounds, 8 ounces; body weight 162 pounds, 8 ounces; body weight 162 pounds, 8 ounces; body weight 167 pounds, 6½ ounces. They just did not agree.

There were 50 subjects and I found inconsistencies in 9 out of the 50. That is the first thing that made me suspicious. The next thing that made me suspicious was the way these statements that these people had all received a similar kind and quantity of food. As you probably know, because you had evidence before you here, the effects of food can be very marked on the rate in which alcohol is absorbed in the stomach, so it is important to know exactly what these people did find out in their driving experiments. The statement was made, and I quote verbatim from page 16:

The kind and quantity of food consumed was similar in all subjects.

From some of the figures I saw, I just could not believe it was similar in all subjects. It is contrary to human physiology that you get these figures. I wrote to Dr. B. B. Caldwell, who is the editor of this publication—he is here in Ottawa with the R.C.M.P. laboratory—and what Dr. Caldwell told me—and I have Dr. Caldwell's letter here with me—was that they did not receive the same; the same was made available to all of them, but they did not all eat the same amount of food. You can give me bacon and eggs for breakfast, but if I eat only one egg instead of two and do not eat the bacon at all, or if I eat one roll and do not eat the other roll, there is going to be a marked difference on the rate in which the alcohol will pass from my stomach into the blood. That made me suspicious. Then another thing that made me suspicious was of all the 50 subjects who had low levels of alcohol of .8 there was not a single case of improvement. Gentlemen, it has been known for close to 50 years—and I have literature of one type or another to show—that an appreciable number of people show actually improvement—you would not say this in public—instead of impairment of the mental faculties when the level of alcohol is at a low level in the blood. In fact, one of the persons in Toronto, Carol Vogel, of the alcohol foundation, was the

one who reported improvement, she just measured muscular co-ordination and I think she measured vision. At any rate, it is a well known fact that at low levels of alcohol, a small percentage of people show improvement, not impairment. Therefore, another reason that made me suspicious was that they showed no cases of improvement.

As a result of that, I investigated this book very carefully, paid no more attention to the conclusions and here were my findings. I have read every page in this book, not once, but many times and here is what they show. They do not show in upwards of a thousand cases, an error of only .1 parts per thousand, but they show roughly that in one in six persons there was a difference of more than .1 parts per thousand. There were difference of .3 parts per thousand and there were also differences of .4 parts per thousand. That shows—and I hope I will not be misinterpreted, Dr. Ward Smith is a man of the highest integrity here in Canada. He is a great authority in his own particular field, but this is just something you very commonly see in scientific literature—that the conclusion does not agree with the data.

We come now to conclusions from this, and you need not be any authority on alcohol to appreciate these conclusions. In this publication is shown rates at which alcohol disappears from the body, the numbers of parts per thousand. On the average, the alcohol disappears from the body at the rate of about .15 parts per thousand per hour, but it may be less than that, and it may be as high as .2 or .25 parts per thousand. The average is .15. Gentlemen, 3 parts per thousand is absolutely impossible, because .3 parts per thousand would mean that a man could drink a quart of whisky every day and have no alcohol in his blood the next morning. That is exactly what it means. A simple calculation will show that at .3 parts per thousand a person weighing 150 pounds, will eliminate from his body roughly 30 grams of alcohol, which is 40 ounces of whisky, because whisky is about 40 per cent alcohol. That is what .3 would show and it is absolutely impossible. This report does not show .3. The breath tests here show .6 parts per thousand, .7 and close to .8. In other words, according to some of these breath tests in this report a man can consume a gallon of whisky a day and have no alcohol in his blood the next morning, which is absolutely fantastic and it is ridiculous. But that is what the breath tests show.

We can, knowing the person's body weight, knowing the rate of elimination—that is, parts per thousand—express our results in grams per hour. On the average—if we took the average of everyone in this room—we eliminate about 7 grams of alcohol per hour. We could eliminate 10; we might eliminate 15 but no human being has ever eliminated 20 and certainly never 25 or 30.

What do the breath tests here show? Gentlemen, they show eliminations of 30 grams a day, 40 grams a day, 50 grams a day, 60, 70, 80, 90, 100, 110 and 120. It is absolutely fantastic. You can either accept these figures or reject the breathalyzer. You have no alternative on strictly scientific grounds.

Apropos of this, there was a case of criminal negligence before the Honourable Mr. Justice King of the Supreme Court of Ontario, in Windsor a year or so ago. The experts for the crown were perfectly happy with the breathalyzer test; everything was conducted exactly as it should have been; there was no question about the reliability of this test. This thing went on for some time and the first question Mr. Justice King put to me was this:—I meant the lawyer from London.

I forget his name. It does not matter. The case was before Mr. Justice Maurice King. The first question counsel put to me—mind you gentlemen I did not expect that answer to come so quickly. I knew that question was coming but I thought it was going to come much later in the trial but from what I had told counsel he put this question to me as the first question. "I have heard what these experts have to say, what is your view?" I turned around to his Lordship and I said: "My Lord, the figures here show that this man has eliminated, during this particular period, so many grams", I have forgotten but I think it was 22 or 23, "of alcohol in an hour, which my Lord, it is absolutely impossible for a human being to do." I went on to say that I felt so strongly about it and said a witness should certainly not be dogmatic because it tends to question his credibility, but that if the crown would show me in any publication in any part of the world on alcohol that a person had eliminated the amount of alcohol in an hour which the crown claims this person had eliminated in this event, I would have to apologize to the court for being here. I would have come here not to help the court, I would have come here to mislead them. That is all that happened.

There was a silence almost like a Perry Mason silence. Mr. Justice King turned to the crown prosecutor and asked if he wished to cross-examine the witness. The prosecutor replied: "No, sir." That was it. Then he came back and said he had just one question. He wanted to know how many breathalizers there were in the United States. I told him I did not know. So that was that part.

Now we are through with the grams per hour, but gentlemen, and here is where human metabolism comes into the picture—I will not keep you very long now. The reason I gave you the history about the diabetes was to let you know that alcohol is a food to the extent of 7 calories per gram. Now, the law of conservation of energy, as you all know from your lectures in physics at school, tells you that energy cannot come from nowhere. Wherever energy is active it must have been potential elsewhere. Therefore, you cannot do any work of any kind without expending calories.

Many years ago, for different reasons, we had to determine the amount of calories a person consumes with a given occupation, per hour and per body weight: for example, sleeping. You saw that machine which I passed around where you put the man right in the machine when he is sleeping. If you are sitting or standing or engaged in different occupations, sawing wood, swimming, walking so many miles per hour, running so many miles per hour, we now know with a high degree of accuracy exactly how many calories you need for a particular type of occupation. For example, I could tell you pretty well how many calories this gentleman here on my left used when he lifted up his hand to put the cigarette to his mouth. He could not do that without expending energy from the muscles of his arm and that means calories.

Now, since we know that, gentlemen, and I have all the data to prove beyond all doubt, you will either accept this or you will reject it. If you accept the breathalizer here is what you must believe. A man sitting in a motor car—that is what these people were doing—doing nothing else but driving the car with a little bit of muscle—the muscle he had to use to move his arms and legs—that man sitting for one hour—I have the exact figures here; there were 5 subjects; they were sitting for one hour doing nothing but driving the cars—

you believe the breathalyzer tests, not my breathalyzer test but these breathalyzer tests done right here in Ottawa, here is what you also have to believe. A man sitting for one hour in a motor car doing nothing else but driving that car is working as hard as a man who is running 5.7 miles in one hour. He is working as hard as a man who is swimming for one solid hour. He is working as hard as a man who is sawing wood for one solid hour. Now, you can believe that or you reject the breathalyzers.

To sum it up, gentlemen, what I have done, and I have the figures with me here, is that I have collected from the literature purposely for this Bill No. C-87, all of the cases I was able to find where breath and blood were compared and where both tests were done simultaneously and where without a single exception there were no technicians involved. These tests were done by very competent men, by the best biochemists in England and the United States and by the best men in Canada and, in fact, I have forgotten what page it is shown on, these tests, the chemical analyses and the breath analyses, were done by Dr. Ward Smith and by Dr. Professor Joslyn Johnson Rogers. On page 5 there is the statement that Dr. Smith and Professor Rogers helped in planning the experiments, participated in the conduct of the work, especially in providing and in operating the breathalyzers and helping with the chemical analyses. Here there were no technicians doing any work, here were the top notch men doing work. That, gentlemen, also applies to the men whose data I have taken from the United States and the men whose data I have taken from England and the men whose data I have taken from Canada. They are all top notch men. I was able to collect 373 cases where the blood contained less than .8 parts per thousand. Gentlemen, of these 373 cases—and incidentally I have the exact reference to the literature of every case which you may want to question—where the blood test showed less than .8 parts per thousand, every one of the 55, one in seven, would have been convicted by this bill, roughly one out of seven.

That is really all I have to say, gentlemen, except for one thing: one out of seven. The only thing I have to say is this, certainly you did not bring me here to preach a sermon; furthermore, I am not competent to preach a sermon, but religion, gentlemen, does govern all our lives, more or less. If you will look up the 16th Chapter of Deuteronomy, Verse 20, it says: "Justice, justice shalt thou pursue." The only place in the whole of the Old and New Testaments where there is a repetition. Twenty-four hundred years ago, when the great rabbis of that period asked this question: "Why the repetition of the word justice?" The answer was this: "It applies to two different things. The first justice applies to that which you must pursue; the second applies to the method by which you must pursue it." It teaches that one must not use unjust methods to arrive at justice. That is all I have to say.

Gentlemen, I am open to any questions. You can question me by the hour; I have not made a single statement which I cannot support by published data; I have not in any way used any of my own data, although I have done breath analyses long before there was a traffic problem.

The CHAIRMAN: I have just one suggestion I would like to make to Dr. Rabinowitch. This demonstration you put on the blackboard will not appear in the proceedings. Can you make a graph for us before you leave today?

Mr. RABINOWITCH: Yes, sir, I will be very glad to do so. I have Dr. Harger's data for that for which I am very glad.

The CHAIRMAN: The other thing is these booklets to which you referred. Quite usually we make them exhibits, but I think these are really personal property and once they become exhibits you would never get them back again.

Mr. RABINOWITCH: Well, gentlemen, that is my problem. I have lost more valuable literature through the years and I do not believe it is an exaggeration to say that I have pretty well about 95 per cent of the world's literature on alcohol. I have over 20,000 reprints on alcohol and every time I have lost one—you can lend a man \$1,000 but you cannot lend him a book and never lend a lawyer a publication because you will never get it back. However, gentlemen, this is the last time I am going to talk about breath, because I am tired of it and, therefore, I am prepared to leave these here with the hope that care will be taken of them.

The CHAIRMAN: They will be taken care of but I doubt whether they will ever get back into your possession.

Mr. RABINOWITCH: I am sorry, then. I am retired; my time is my own and it does not cost the government anything to keep me here except to pay for my meals. I would suggest that any particular article which the gentlemen may want—I have to stay in Ottawa for train connections anyhow—I will stay in Ottawa all day today and all day tomorrow and give you an opportunity to make photostatic copies of anything of interest. You do not have to use the whole article, just use certain parts of it. I will leave them with you, Mr. Chairman, to make photostatic copies of any parts you may want. If you do not mind, I would like to pick them up before I leave. I have to leave early tomorrow about 8.30.

The CHAIRMAN: I will see Mr. Guay, Mr. Tolmie and Mr. Mather, in that order.

(Translation)

Mr. GUAY: Dr. Rabinowitch, you said at the outset of your remarks a while ago that you are one of the only ones to oppose this breathalyzer test. Why are you alone in opposing this test, or at least one of the very few?

(English)

Mr. RABINOWITCH: I wanted to bring out the point, sir, that there are very few men holding highly responsible positions, all highly respected men, no question about their integrity, all highly expert in their respective fields but they are not authorities on human metabolism. For example, a man may be a top notch doctor, a very good doctor; there are no personalities involved here, this is a scientific investigation. Take a man like Penner out west, a top notch man; you cannot argue with that man at all but the man is a pathologist. At best he is a pathologist and pathology is one branch only of the necessary knowledge for human metabolism.

The only person I know of in Canada is this man Cantor out west. I have before me here a letter from the Chief Justice of the Supreme Court of Alberta and he very kindly sent me a photostatic copy of this trial where the breathalyzer was turned down—the case went to appeal—for one reason because Dr. Max Cantor brought out to the satisfaction of His Lordship, and he specifically brings out that point that he is quite satisfied with Dr. Max Cantor's evidence, that although the average is 2000 to 1, it could be 1300 to 1, and what we are concerned with here is the man and not the average. I have the case here and if you wish, gentlemen, I will leave this transcript behind. It was the case of the Attorney General of the Province of Alberta versus Joseph Crack, judgment

before His Honour Judge J. S. Cormack. He was from the judicial District Court of Northern Alberta. Would you like me to leave this with you?

(Translation)

Mr. GUAY: At this point I would ask you this. You have rejected the validity of the breathalyzer test on statistical or scientific evidence. What I would like to know is what you would prefer, what you would propose, positively, to establish evidence before the courts?

(English)

Mr. RABINOWITCH: I would propose, sir, a blood test. Parliament can do anything. They can make laws and they can break laws and although it is an infringement on the person's rights, and so on, if you like, but we are dealing with a serious matter here. People are being killed on the highways every day of the week and you have to do something. Parliament says you can vaccinate a person for smallpox whether he wants to be vaccinated or not. Is that not compulsory.

The CHAIRMAN: I do not think it is compulsory unless you go out of the country.

Mr. RABINOWITCH: I do not see why the blood test is, but, gentlemen, although I approve of the blood tests and approve of them heartily, I approve of much less than .8; I would like to see .4 instead of .8. I would like to be certain there is better control in our laboratories in Canada on chemical blood tests.

There have recently been some very disturbing experiences. They are of a confidential nature, according to a letter I received from Dr. Ward Smith, but you might, if Dr. Ward Smith has not yet testified, tell him that I mentioned that there has been recently—I think two years ago—some disturbing experiences where they sent the same blood to five or six different laboratories and received five or six different results. Incidentally—this should encourage us—these accidents did not occur in our large laboratories; they occurred in smaller communities where they took the sample of blood and gave it to the doctor and God knows what happened to it from the time he took it until the time the laboratory received it. But even Dr. Ward Smith admits that one out of seven of his own experiences was a disturbing one until he corrected it. Let me say again, gentlemen, Dr. Ward Smith has a very excellent technique for chemical analysis of the blood—an excellent technique.

I would prefer the blood, not the urine and certainly not the saliva. That is completely out. Everything hinges on the blood; you are doing the breath test to determine what is in the blood; you are doing the saliva test to determine what is in the blood. I would like to see the blood test and I personally would like to see it made compulsory.

I have often discussed this with judges and also with Mr. Hazen Hansard when he was still president of the Canadian Bar Association.

Mr. RYAN: Dr. Rabinowitch, would you take arterial or venous blood?

Mr. RABINOWITCH: You cannot take arterial, that is a dangerous procedure.

No, you cannot do arterial. That is out. It has to be venous, and the mere fact that it has to be venous throws out the breath test. I do not care if the breathalyzer or what it is because the breath test for a good one hour after-

wards is showing much higher values than the vein; the artery is higher than the vein and the breath depends upon the artery, not upon the vein. So much so that later on when the breath is falling, in due time—as a matter of fact I will put it this way—since most people have their blood taken, say, one hour after they have had their drink, there would be a tendency for the breathalyzer test to show less than the blood which would favour the accused because down here the artery begins to show less than the vein.

(Translation)

Mr. GUAY: Still, you said there was a chance of error in every case, but there is a 20 per cent margin of error in the blood test. How can you believe that if you want to pass legislation equally applicable to all citizens throughout this country, it is possible to organize a blood test to be administered so as to reduce the margin of error as much as possible when we are remote from any hospital, medical centre or other properly equipped location? How can this be applied throughout the country? How can we make such a blood test mandatory? Would it not be easier to go by the breathalyzer test?

(English)

Mr. RABINOWITCH: A breathalyzer test would come in handy if you could rely upon it. If you are perfectly content to convict one innocent person out of twelve, use the breath test.

I will admit that there is no question that in a lot of places in Canada they cannot do the blood alcohol test properly. But there are methods today, gentlemen—very simple methods—of preserving a blood and doing the test two or three days, or a week later. This is a simple method today that takes exactly ten seconds to add something to that tube, cork it up tightly, and it will preserve that blood at least a week or ten days. So that blood could be taken from a place where there are no facilities available to Toronto or Montreal to one of the big laboratories. There is no problem there. Of course, there would be a delay in bringing up the case for trial, and so on.

I just cannot see the breathalyzer. I cannot see it because of the patently immoral principle—the end justifies the means; that is what you are doing. That is what we are saying here. If one person out of ten, and I have shown one out of four and one out of five, as a matter of fact, I have shown one group of case here with five out of seven, which is roughly 70 per cent. I cannot accept that as a legal proof—put it this way—legal proof, morally.

There is no question that we have a big problem before us in traffic accidents, but you are going to make the end justify the means, which is patently immoral. I think we overcome your problem, sir, by using the very simple means of preserving the blood and they can do the test a week or ten days later. It will postpone the trial for ten days or two weeks.

Lawyers are always postponing trials anyhow. I have one that has been going on for three years now.

(Translation)

Mr. GUAY: But it is not the analysis of the blood, it is the actual taking of the sample of blood which presents difficulties. How can we take a blood sample from a person who is arrested? It is not always easy. In other words a percentage of the people could not be reached in this way?

(English)

Mr. RABINOWITCH: That cannot be very large. If it is a small percentage, well, go by the clinical signs.

I cannot agree on anything that is an immoral principle. To me it is immoral, and I would rather see a guilty man go free than use an immoral method. It is immoral, and I cannot use a stronger word, and I know that by using these strong words I am giving you every opportunity to question my credibility. But it is immoral, gentlemen. We are using a means to justify an end. If the means is not just—

Mr. RYAN: Mr. Chairman, on this point, may I ask a supplementary question? I understood from your evidence, doctor, that the widest present error would be about four parts. If this were the case and in view of the fact that you think .04 itself ought to be the basis, surely, then, if we put in a figure of one part per thousand we would be allowing for all possible errors, and it would make sense then to have the breathalyzer test.

Mr. RABINOWITCH: I think, sir, that I have quoted cases, and one in particular, of .61 with the blood and 1.59 with the breath, and I think I quoted a .6 in one and 1.63 in the breath. That is a .9 difference, not a .4 difference.

Mr. RYAN: But these were far out cases, were they not?

Mr. RABINOWITCH: Some were far out, yes.

Mr. RYAN: Then, .04 would cover how many cases of error as a percentage?

Mr. RABINOWITCH: I think a .4 would cover about 90 per cent.

Mr. RYAN: Breath?

Mr. RABINOWITCH: Yes. Personally, I do not like it, and I cannot compromise. But I must admit that .4 would cover about 90 per cent of the people.

Mr. RYAN: Thank you.

(Translation)

Mr. GUAY: One last question. Could we contradict the blood test before the purts? Could we enter contrary evidence?

(English)

Mr. RABINOWITCH: If the test is done in a laboratory where there is no question of reliability—if it is done here in Ottawa, or Toronto, or Montreal—I do not see how any honest and sincere scientist will contest, but I must say that I have to underline the words "honest and sincere".

I had a very sad experience recently of out and out perjury on both sides in one of our courts before the hon. Mr. Justice Grant. I should never have been in the case at all, had I not been completely misled by the lawyer who was a witness in the case—he was fighting the case, he was a witness in the case. He was on one side. The other one I do not mind quoting. The chief medical examiner for the city of New York deliberately lied before the court, deliberately, because he told the court exactly the opposite of what he told me when I went down to New York to investigate the case. He gave me all the facts and we came before the case and I said: "Here is Dr. C—what the hell is he doing here?" The doctor gave evidence completely contrary to what he gave me. So here we have a case of perjury on both sides.

Then I have a case in Saskatchewan, I do not see why the judge, Mr. Justice Bence, the Chief Justice of Saskatchewan, did not order his arrest right from the bench. The man was just an out and out liar. As I said, the crown prosecutor fired him that same day, and the R.C.M.P. fired him the next day.

But those are rare, sir. I do not think that an honest and sincere medical expert would get up and contest the accuracy of Dr. Ward Smith's analysis or Dr. Penner's analysis, or any other qualified doctor's analysis.

(Translation)

Mr. GUAY: Why can we contradict the breathalyzer test in that case whereas some doctors, as you say appear to favour it. Indeed you yourself seem to give it some validity. We could not contradict the blood test then?

(English)

Mr. RABINOWITCH: The blood tests are contradicting a piece of chemical evidence. This is metabolism and these men, gentlemen, are simply not authorities on human metabolism. They are authorities on particular branches of human metabolism. They are biochemists, or pharmacologists or physiologists.

I did not want to bring in my own experiences, I preferred not to, but I want to show you gentlemen the difference between my work and police work—I am out of the picture now—but when I was doing my work before I retired, these people who drank this alcohol did not come to me for alcohol; they came to me to check their diabetes, and they would not lie to me and tell me they only had a bottle of beer when they had ten quarts of whisky, or whatever it was.

Now, I got their history. You see in police work a policeman sees a man. Another man takes the blood. Another man does the analysis, and another man does the interpretation. In my experience, gentlemen, this was the situation. I saw the man. He had to tell me what he did in the last three days, alcohol and so on. I examined that man, not cursorily, but from head to feet. It was part of his consultation. So I see the man; I examine him myself; I take the blood myself and I do the test myself. I did not want to mention this at all, but I would prefer that you rely upon all of this rather than upon my evidence. And that is the reason I said I did not want any opinions, either. I do not want you to accept any opinion that I give any more than I would accept their opinions. I want facts, and I am giving you nothing but facts, incontestable facts.

You have to accept this, or you have to say a man sitting in a car for one hour is working as hard as a man who is swimming for one hour. Now gentlemen, none of these experts whom you may call here know about this swimming and this sawing wood. I brought this here purposely as an example. All that I did was to apply my knowledge of human metabolism and I took the grams of alcohol and converted them into calories and used my data of the known relationship between work done and calories consumed.

Mr. TOLMIE: Doctor, I believe in your evidence you stated that you would be in favour of incorporating a law whereby a man who was driving with .8 per cent or .4 per cent of alcohol in his blood should be guilty of an offence. You seemed to indicate that a breathalyzer test would not give a true indication of the actual alcohol in the blood.

Mr. RABINOWITCH: That is correct.

Mr. TOLMIE: To allow for this latitude—and one of the members of the Committee alluded to this point—or this error, as you allege, would you be willing to favour such an amendment whereby a man could be convicted of a driving offence if a breathalyzer test showed he had .15 per cent alcohol in his blood?

Mr. RABINOWITCH: As long as we understand that what we are aiming at is .4.

Mr. TOLMIE: In other words, you would accept the breathalyzer test if you made it so high that any margin of error—

Mr. RABINOWITCH: Exactly.

Mr. TOLMIE: This to me is an important concession.

Mr. RABINOWITCH: The only thing is this, sir: if you make it 1.5 you are going to miss all these people. I do not think you are going to solve the traffic problem.

Mr. TOLMIE: It may not be 1.5 but a higher limit, and that would have to be determined. I do not think any member of this Committee is qualified to attack your scientific evidence and your medical background, and I think we can only speak from conclusions we have arrived at in our own experience as laymen, but I think, in a sense, that the proof of the pudding is in the eating. The breathalyzer test had been used in many jurisdictions, especially Sweden, and the result achieved has been good, it has been beneficial to many, many people in the sense that the rate of accidents has decreased. Now, you mentioned in your evidence your great adherence to justice. Assume for a moment that there is some measure of injustice. Is it not preferable to use a device which has actually curtailed accidents and helped many, many people than forego it on the possibility there is some inaccuracy? This is a matter of philosophy and I know you do not agree with that assertion, but I think this is something that really has to be evaluated.

Mr. RABINOWITCH: In effect what you are saying is this: you are all my patients and in my opinion you require a certain type of treatment. You want me to prescribe that treatment, knowing perfectly well that I will kill two out of the twelve present here, and I cannot do it.

Mr. TOLMIE: I think that is an exaggeration. In the first place, it is not a question of being killed; it is a question of the greatest good for the greatest number. Again, this is something I do not think you will agree to.

I have one further question. What about the validity of the urine test?

Mr. RABINOWITCH: The urine test is certainly much more satisfactory than the blood test, if certain precautions are taken. These precautions are quite often not taken even in the best laboratories, and I want to cite a case which was heard before the Honourable Mr. Justice Judson of the Supreme Court of Canada. I happened to be involved in that case and I do not want to mention the names of the other people, but they were all from the Attorney General's department of Ontario. In this case there was a breathalyzer test and a urine test. A urine test is the most dangerous test there is unless you get the person to pass his water, throw it away, get another sample half an hour later and take the sample between the two. There is a pamphlet issued by the Ontario Attorney General's department warning the police officials that they must take the two samples.

You can do what you like with the first one, you can keep it purely as a matter of curiosity, or whatever you like, but the bladder must be empty and then half an hour later take the other sample. In this particular case that was not done. Not only that, but the urine showed 1.8 parts per thousand and the breath showed 2.1 parts per thousand. After this particular witness had said that in his experience there is no such thing as an error higher than .1 parts per thousand, in his own laboratory the urine showed 1.8 and the breath showed 2.1 parts per thousand. Firstly, there was a discrepancy between the two and, secondly, the urine was not collected properly. I would prefer the urine test. I think a urine test done under proper conditions is a reliable test.

Mr. TOLMIE: What you are saying in effect is if the urine test could be perfected, and sent with the actual execution of the test itself, it would be the best test and perhaps this is the way we should be doing it instead of the blood test, which is so inconvenient and difficult to achieve. We need to improve the method of doing the test. The test itself is good.

Mr. RABINOWITCH: It is not as good as a blood test, but it is good. Let me put it this way: if there is a legal objection to a compulsory blood test, certainly I would prefer the urine test done under proper conditions.

Mr. TOLMIE: You would prefer it to the breathalyzer test?

Mr. RABINOWITCH: There is no comparison. Gentlemen, this book itself shows the superiority of the urine test over the breathalyzer test. If the authors of this work would only analyze their own data instead of drawing conclusions they would find that the urine test by far exceeds the accuracy of the breath test. This is their own publication.

Mr. MATHER: Mr. Chairman, I think all members of the Committee would agree that the doctor has presented his point of view in a very striking fashion. The fact that I am the sponsor of this particular bill, or subject matter, which is before us does not hinder me from admiring his presentation. However, I have three or four questions I would like to ask.

In the first place, the doctor has very frankly said that he is almost alone in his position on this. He is therefore aware that the Canadian, British and American Medical Associations, all of whom have done a great deal of research presumably, favour the breathalyzer test. He has quoted Ward Smith as an expert in his particular field.

Mr. RABINOWITCH: May I answer that? I have three letters before me, one from the general secretary of the Canadian Medical Association dated July 6, 1964. This letter was in reply to a letter I wrote asking the Canadian Medical Association to organize a committee—not to have me on it, not to have Ward Smith on it—and to have the outstanding physiologist in the world on it, who happens to be in Toronto, Dr. Charles H. Best, who discovered insulin with Dr. Banting. Here is a top notch authority on human metabolism, there is no question about that, I wanted him on the committee, and then I wanted Dr. Ferguson, professor of pharmacology at the University of Toronto, a doctor of medicine and an authority on metabolism. They refused to set up that committee. They felt their own experts were sufficient. Not only that, but in this letter, Dr. Kelly says, "it will not surprise you that I am incompetent to judge the merits or shortcomings of a breathalyzer test".

Then I get a letter from Dr. Troup, who at one time was on the committee, and Dr. Troup says, "Like Dr. Kelly, I am not a pharmacologist, but because of the views you have expressed I am referring the correspondence to three medical men". Why he could not get Dr. Best at the time I do not know, but I think Dr. Best was sick at the time. He said Dr. Ferguson would be very glad to appear before this committee. I received a letter from Dr. Troup telling me that they will not hold this meeting and therefore Dr. Ferguson was not called. I sent a copy of that letter to Professor Ferguson. I named one man in Canada, in addition to this fellow Cantor, who could argue with me on this particular point. He is a real authority on metabolism. Why did they not ask Dr. Best's opinion? Why did they not go to Dr. Ferguson? If you wish you may have photostated copies of these letters.

The CHAIRMAN: Would you like to have photostated copies made available?

Mr. MATHER: Yes, I think that would be a good idea.

Mr. MATHER: Mr. Chairman, the doctor is critical of the basis on which the Canadian Medical Association appointed its committee or arrived at its opinions. Nevertheless the Canadian Medical Association did appoint a committee and they, like the American and British medical associations, favour the breathalyzer test. He has quoted from Ward Smith who has already appeared before this Committee and said that in his own field he is an excellent man and an expert. I think that is fair.

Mr. RABINOWITCH: There is no question about it. As a pharmacologist he is tops.

Mr. MATHER: I want to quote from Ward Smith on what seems to me to be an important ingredient in the doctor's contention, that is, the variance between blood and breath with regard to alcohol tests. Now Ward Smith says, and I am quoting from the *Criminal Law Quarterly*: "In practice"—that is, in the practice of taking a breathalyzer test—"In practice there is always some lapse of time after an accident or moment of arrest and the time of taking a breath sample. It should be stressed that at no time does the breath test indicate a concentration higher than that which is in the blood being carried to the brain. It is the concentration of alcohol in this blood"—the arterial blood—"which is the best index of the activity of alcohol on the brain and, so far as it applies, of the behaviour of the person. Theoretically, when this effect is extreme, calculations based on the concentrations of alcohol in breath and the body weight intended to reveal total alcohol in the body may result in a quantity greater than that consumed. Practically, as the results obtained by the officers in training will show, this effect was not demonstrable in their experiments under extremely rigorous drinking conditions."

I would like to ask the doctor's opinion on that statement by Ward Smith.

Mr. RABINOWITCH: That point has come up time and time again, ad nauseam, in our courts.

Everything that we know today about the relationship between the degree of impairment of the mental faculties—or intoxication, if you like—and blood is based on venous blood.

Now, here I have given a person a sample of drink and his blood goes up, it reaches a peak, and then it comes down. These are his veins, these are his

arteries. Dr. Smith is absolutely right when he states that what determines the intoxication is the level in the brain and not the level in the blood. Now, that is the arteries. I have talked time and time again with Dr. Ward Smith and I simply cannot get that point across. It is simple reasoning. It is not a question of stupidity; he is not a stupid man. He is not a doctor and I cannot talk that language to him. Here is what I have been trying to show courts time and time again.

I hope none of you people here are diabetics because I am going to show you something about diabetes. We want to know if a man is a diabetic or not. He has a very mild case, he has no symptoms. He applied for life insurance, they found sugar in his urine and they turned him down. They send his urine to somebody else to see if he has diabetes. You give him a drink of sugar and you take a sample of blood and you do his blood sugar periodically. If you find that the blood goes above 180 he is a diabetic. But suppose you took a sample of his arterial blood, it would not be 180, it would be 240 or so. Suppose I just took the arterial blood and not the vein; everybody in this room would be a diabetic because you would all be above 180. What you are doing is comparing cabbages and cows. You are using the vein for your test and you are using the artery. Furthermore, a man can only have a certain degree of impairment at a particular moment. He cannot have a higher degree and a lower degree at the same time. He can have two different bloods at the same time, one in his artery and one in his vein, but he is either impaired or he is not impaired with a particular level. Now, that particular level which we all use is the vein, not the artery. In fact, I could not get that across to some judges, but it is true. What determines the intoxication is the effect on the brain. It is true that the artery reflects the brain and not the vein. It is true that the breath reflects the artery, but you are not testing the artery, you are testing the vein. Let us say that I have a wheel one foot in diameter and I have another wheel of only two inches in diameter, and I connect the two of them with a pulley. The small wheel makes many more revolutions than the large wheel but the car is only going a certain speed. The car is being governed by this particular speed, not by that speed over there.

Mr. MATHER: You would then disagree with the contention of Dr. Wallace Troup, who was the chairman of the Canadian Medical Association committee, who stated that the important fact is the amount of alcohol in the arteries supplying blood to the brain, and the breath test measures this with great accuracy.

Mr. RABINOWITCH: I do not want to get involved in personalities, but Dr. Troup, as far as being an expert, does not compare with Ward Smith. In fact, in a letter to me dated July 14, he says, "I am not an authority." What is the good of accepting what he says when he himself says, "Like Dr. Kelly, I am not a pharmacologist and because of your views I am referring the correspondence to three medical doctors who share our interest and concern in the serious problem of drinking drivers."

Mr. MATHER: You would prefer Dr. Ward Smith to Dr. Troup?

Mr. RABINOWITCH: Oh, there is no question about it.

Mr. MATHER: Let me quote this from Dr. Ward Smith:

The concentration of alcohol in the breath test will more closely reflect the condition of the subject than will the concentration in the arm (venous) blood.

Mr. RABINOWITCH: Would you mind repeating that, please?

Mr. MATHER: There is a paragraph here by Dr. Ward Smith in which he is describing absorption of alcohol in the body. He has three points. I think the key point is his ending in which he says:

In this respect—

That is, during the absorption—

—the concentration of alcohol in the breath test will more closely reflect the condition of the subject than will the concentration in arm (veinous) blood.

Mr. RABINOWITCH: Sir, you have the answer to your problem. All you have to do is change this. Delete the word "vein" and put in the word "artery", and delete the whole matter of impairment. Get rid of the statutory offence. It means nothing. Do not bring in impairment, because if you bring in impairment it will bring me back to the courts and that is a nuisance. It is not very pleasant to have to disagree with top-notch men, very highly ethical men, in courts. Delete the impairment and merely make it a statutory offence to have so much alcohol in your blood according to the breath test of the blood arteries. Change from "vein" to "arteries" and you have it.

Mr. MATHER: Well, as I have said earlier, I would go along with the proposition put to us two days ago by the Bar Association in which they would do that. Instead, as my bill, making .08 per cent a basis for conviction, the Bar Association would set a limit, .08 also, and make it against the law for a person to drive with the content at that level or higher.

Mr. RABINOWITCH: Yes, but do not bring in the word "impairment".

Mr. MATHER: Those are all my questions, Mr. Chairman.

Mr. MACEWAN: One question, Mr. Chairman, following up what Mr. Tolmie was asking about urine tests. I would like to ask the doctor if he could give the Committee any idea what the margin of error is in using the urine test as compared to the blood test?

Mr. RABINOWITCH: The urine test, I think, should be accurate within 10 per cent. In a properly conducted laboratory you should do your blood tests within two to five per cent. Dr. Ward Smith's blood test which he devised himself pretty well gets the blood within five per cent. The urine has half the accuracy of the blood, but it is a reliable test. I would like to see the blood, but if you cannot have the blood, have the urine.

Mr. FOREST: Just one question regarding your suggestion to take out the word "impairment" and put .04 instead .08, and use the breathalyzer test. Would that be it?

Mr. RABINOWITCH: No, the point is this, remove the word "vein" and put in "artery". Remove the word "impairment" altogether. Make it a statutory offence. There are certain things the law will not let me do because it is a statutory offence. Make your punishment as much as you like.

Mr. FOREST: What about the breathalyzer test?

Mr. RABINOWITCH: I do not care. Yes, if you will do that, remove the "urine" and remove the "impairment". Then you are depending upon the arteries.

Mr. FOREST: Would .04 be too low?

Mr. RABINOWITCH: No, it would not, because I have seen people with .02 impaired, but a very small number.

Mr. FOREST: But on an average, what would be the amount of drinks a person would have to consume to have .04?

Mr. RABINOWITCH: I have often had that question asked, but you cannot answer it as dogmatically as it is being answered in the court. It depends on your weight, the condition of your stomach, whether there is any food in the stomach, and it frightens me when I hear the dogmatic statement that you have so many drinks in your body. It is very frightening, and I will tell you why. If you get a man early enough he will have more alcohol in the vein in his arm than he will have in the vein in his leg. It is not yet uniformly distributed. There is one point, sir, that you raised which I think should be commented upon. Admittedly, your test is done some time after the accident, but we know that although it is an average, the average fluctuates in a very narrow range. The rate at which the body eliminates alcohol is constant. There are no two people in this room who will eliminate it at the same rate, but whatever your rate is it will be constant elimination. Therefore, if I know what your blood is now, I can pretty well tell what your blood was three or four hours ago.

Mr. MATHER: Mr. Chairman, I have an appointment but I don't want to run away—

Mr. RABINOWITCH: I will tell you, sir, if you have to go away, I am going back to the hotel and I will be there all afternoon waiting for you. I am in room 533 at the Chateau. Come up, sir, and I will give you anything that you want.

Mr. MATHER: Thank you very much for your answer.

Mr. HONEY: I have just one question to ask the doctor. If this Committee recommended to the House of Commons that a statutory offence be created for a person to operate a motor vehicle with more than a stated amount of alcohol in his blood, and if the reference were to arterial blood, are you satisfied, doctor, that the tests made by a breathalyzer would be accurate enough for the purposes of justice?

Mr. RABINOWITCH: Yes. Arterial blood, yes.

Mr. HONEY: This may be more of a legal question than a medical one, but would you feel that it might be preferable not to refer to any blood, but merely say that it would be an offence to have a reading of more than .08, or whatever the case may be, shown on a breathalyzer, rather than tying it in to arterial blood?

Mr. RABINOWITCH: You mention no blood at all. You do not mention impairment. Use anything you like with a breathalyzer. Use your own judgment, your opinion is just as good as mine.

Mr. HONEY: My opinion—and I just throw it out to you—is that the Canadian Bar Association has suggested that there, in effect, be two offences. One it would be an offence to exceed a certain amount of alcohol in the blood. If the test indicated that the alcohol exceeded that figure, then the man would have committed the offence. They would create a new offence of impaired driving, which might be proven by clinical evidence or other evidence, not necessarily

related to the breathalyzer test. Would you feel that this two-pronged approach would have merit?

Mr. RABINOWITCH: I do not think the clinical is sufficient. By the time a man shows clinical signs, that is clinical signs that the ordinary policeman or ordinary doctor will detect. For example, one of the earliest signs of intoxication, long before there is anything except for the blood, there is a certain particular thing about the way his eye moves, a certain type of motion. The clinical test is not sufficient. You are not going to solve your traffic problem with clinical tests because you have to be pretty far advanced in impairment to show it.

Mr. HONEY: This is in addition, of course, to the statutory tests.

Mr. RABINOWITCH: All the better. There is nothing better; the more confirmatory tests the better.

There is one point I did not bring up, and that is rather unfortunate because it is a complicated piece of physiology. What keeps—I will try to make it as simple as I can—any food or fluids from passing from our stomach back into our throat and into the back of the mouth, as when you belch, and so on, is the little ring of muscle called the cardia. Unfortunately the cardia does not have the usual strength or contraction that there is in the other parts of the body. It is usually relaxed. If it is relaxed, also bear in mind that the pressure in the stomach is less than the pressure in the gullet, and therefore the least pressure on the abdomen will force contents from the stomach into the gullet back into the throat and give you a false alcohol. That is the reason why time and time again I got a defendant acquitted. I did not want to see him acquitted, he was as guilty as you could make him, but there is a scientific point here, a matter of morality. Before they do these breathalyzer tests they get the man to stoop down to pick up a key or a penny, or something, on the floor. That increases abdominal pressure, and he is forcing alcohol from his stomach into the back of his mouth. Now, these men who are not authorities on human metabolism do not know that point. A number of times I have gotten them to take the man off the charge he was on, and yet I felt badly about the thing because I felt the man was guilty from all the other evidence, but they were using the wrong method. Use anything else you like and the man will be convicted.

Mr. HONEY: The fact that alcohol is forced into the gullet would give an improper reading on the breathalyzer?

Mr. RABINOWITCH: Surely, because you are not measuring the alcohol coming from the breath, you are measuring the alcohol coming from the stomach. That does not happen very often, mind you, but it does happen. In fact, it happened in another case before Mr. Justice King. I want to show you how you have to be careful. This is also a case of criminal negligence. A man was brought in to the station—I have forgotten the details of how the other man was killed—for this breathalyzer test. He was told to sit down in the chair and he sat down. Just as the sergeant was going to bring the machine to him, he said, "I feel sick, I want to vomit." So, the police officer let him get up to go to the bathroom and, in fact, he vomited on his way to the bathroom. He came back, sat in the chair, then they immediately did the test, did not wash his stomach out, and his breath was full of alcohol. As I told Mr. Justice King, "I am sorry to have to disagree with really eminent expert witnesses for the Crown, but it is absolutely criminal"—there was no other word I could use—"to do a breathalyzer test under

these conditions. You were not measuring the alcohol on his breath, you were measuring the alcohol which contaminated his mouth coming up from his stomach." Again, that does not happen very often.

Mr. HONEY: Thank you, doctor.

The CHAIRMAN: Dr. Rabinowitch is very kindly going to make a graph to demonstrate one point.

Mr. RABINOWITCH: When the gentleman comes I will have it all ready for him.

The CHAIRMAN: Is it agreed, then, that this graph be made an appendix to today's proceedings and also whatever photostatic copies are made of the exhibits?

Agreed.

Next Tuesday we will have the Hon. Gordon E. Taylor, Minister of Highways of the province of Alberta, as our witness.

The meeting is adjourned.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 16

TUESDAY, NOVEMBER 8, 1966

Respecting the subject-matter of

Bill C-26, An Act to Amend the Criminal Code (Safety
Devices for Automotive Vehicles)

Bill C-49, An Act to Amend the Criminal Code (Dangerous
Motor Vehicles)

and

Notices of Motion Nos. 26, 31, and 38.

WITNESSES:

From: the Government of the Province of Alberta: The Honourable
Gordon E. Taylor, Minister of Highways; and J. J. Frawley, Q.C.,
Counsel.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS
Chairman: Mr. A. J. P. Cameron (*High Park*)
Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,	Mr. Laflamme,	Mr. Ryan,
Mr. Choquette,	Mr. Latulippe,	Mr. Scott (<i>Danforth</i>),
Mr. Chrétien,	Mr. MacEwan,	Mr. Tolmie,
Mr. Fulton,	Mr. Mather,	Mr. Trudeau,
Mr. Goyer,	Mr. McCleave,	Mr. Wahn,
Mr. Grafftey,	Mr. McQuaid,	Mr. Woolliams—24.
Mr. Guay,	Mr. Nielsen,	
Mr. Honey,	Mr. Otto,	

(Quorum 10)

Timothy D. Ray,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

TUESDAY, November 8, 1966.

(20)

The Standing Committee on Justice and Legal Affairs met this day at 11.25 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Aiken, Cameron (*High Park*), Chrétien, Forest, Graftey, Honey, Laflamme, MacEwan, McCleave, McQuaid, Scott (*Danforth*), Tolmie, Wahn (13).

In attendance: From the Government of the Province of Alberta: The Honourable Gordon E. Taylor, Minister of Highways, and J. J. Frawley, Counsel.

The Chairman introduced the Honourable Gordon E. Taylor, Minister of Highways of Alberta who read a prepared brief re Bills C-26, C-49 and Notices of Motion 26, 31 and 38.

Following his statement, he was questioned.

On a question by Mr. McCleave, Mr. Taylor said he would supply the Chairman with a copy of the Alberta Legislature Report of the Legislative Committee Appointed to Examine into Matters Relating to Automobile Insurance—1966.

At the conclusion of the hearing, the Chairman thanked Mr. Taylor for taking the time to appear before the Committee, and also for his informative statement and enlightening answers.

At 12.40 p.m., the meeting adjourned to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, November 8, 1966.

The CHAIRMAN: Gentlemen, we have a quorum.

You have all received a letter from the clerk of the Committee asking what your intentions are with regard to the trip to Windsor and Detroit. I would ask that you reply to this as soon as possible. I think it will be a really worthwhile trip. Would you please bear it in mind, and to check your diaries to see whether you can, or cannot, be present.

It gives me a great deal of pleasure to introduce the Hon. Gordon E. Taylor, Minister of Highways for the province of Alberta. Mr. Taylor has been interested for a long time in traffic safety, and he represented Alberta at the recent provincial conference on traffic safety.

I think you all have a copy of his brief which he sent to the Committee this morning. If you do not have a copy, the clerk has them at the head table.

Without further ado, I will call on you, Mr. Taylor, to make your statement.

Hon. GORDON E. TAYLOR (*Minister of Highways, Government of Alberta*): Mr. Chairman and hon. members, before reading the submission, I would like to make a correction on the front page. Where "No. B-49" appears it should be "No. C-49", and this should be corrected throughout the submission.

The CHAIRMAN: That is a question of privilege.

Mr. TAYLOR: I would also like to express my regret at not having been able to submit a copy in French. We were so busy that I just did not get time to do this, and I regret this very much.

I am very pleased indeed to accept the kind invitation of your Committee to make representations in connection with

(a) Bill No. C-26—An Act to amend the Criminal Code, Safety Devices for Automotive Vehicles; and

(b) Bill No. C-49—An Act to amend the Criminal Code, Dangerous Motor Vehicles.

During the year 1965 close to 5,000 persons were killed on the highways and streets of Canada. The death toll included little babies and even unborn babies, senior citizens and all age groups between the two.

There is no greater tragedy than the death of a child and this tragedy was repeated over and over again on our roads and streets from the Atlantic to the Pacific and from the International Boundary to the far north.

Whole families were wiped out, others were left fatherless or motherless while scores and scores of homes were saddened because the son or daughter, the brother or sister, the husband or wife would never again return.

A few days ago the entire world was shocked and saddened when more than one hundred and fifty children in Wales were, almost instantly, wiped out.

Investigations and research were jolted into action to ascertain the reason or reasons for the disaster and to make sure in so far as it is humanly possible to do so, that it would never happen again.

In Canada in 1965 close to 5,000 human beings died from automotive accidents and except in the home community the news scarcely made the front page of our news papers. Far too many people have come to accept as inevitable the toll of human life that is daily taking place on our highways and streets; they seem to say "It is the price we have to pay to have a motorized age."

If a town of 5,000 souls was destroyed by a slide or an explosion or a poisonous gas or a terrible disease or for reasons unknown, the whole Canadian nation would rise and do whatever was necessary to ensure that it would never happen again.

The facts that these deaths, to say nothing of thecrippings, occur singly or in small groups should not deter action.

Let it first of all be sounded from the rooftops—*These Deaths are not inevitable!* Our accidents can be drastically reduced!

I am very pleased indeed that the Members of the House of Commons have not accepted the theory that nothing can be done to reduce this massacre that is taking place on our highways and streets. The bills now before this Committee and Bill C-87 (Impaired Driving) are evidence of concern which indicate a sincere desire to do something effective towards a solution to the greatest social problem facing this nation.

Certainly, there is no royal road to safety and the desired solution probably lies in a multitude of interlocking answers and a combination of many items involving human behaviour, the manufacture and maintenance of vehicles, the design and construction and maintenance of highways, roads and streets, effective use of signs and devices, improved and uniform licensing of drivers, driver education, carefully thought-out legislation, wide-awake policemen, strict magistrates and judges and a willingness to do what has to be done to find the causes or causes of accidents through research and to then apply the solution without fear or favour.

The Canadian Government could help materially in solving this problem by

- (1) establishing a traffic accident research center, possibly attached to or made part of the National Research Council; and
- (2) creating a central traffic branch in the Department of Transport or some other appropriate department to conduct investigations and inquiries and to deal with safety matters arising out of the operation of motor vehicles that affect the whole nation.

I. Research

Canada has lacked a co-ordinated research program geared to finding out the whys and wherefores in connection with the causes of accidents. There is very little data that accurately defines the magnitude of the many and varied human, vehicle and environmental factors that may be the cause. We glibly parrot the story that the driver is responsible for the greater percentage of fatal accidents without any actual data to prove it; we say the vehicle and the road, even if perfect would reduce the accidents by only ten or fifteen per cent—but do we know? We deplore the idea that tires might be responsible for a much higher percentage of our highway deaths; and, we have left the research into vehicle road worthiness almost entirely to the manufacturers.

As a result, there have been few standards established and the average Canadian has been left to the wiles of the high-pressure salesman and high-pressure advertising which has too often emphasized only the horse power.

(a) Take for example the tire. It was only this year that a Committee was set up to establish a standard.

In 1965, I, on behalf of the Alberta government, wrote to the Canadian Standards Association asking that a standard be established.

Unless a tire has some mark or sign to indicate that it meets a minimum standard, how is the buyer to know whether the tire is inferior or superior or mediocre? Surely the price charged can't be the criteria.

C.S.A. in reply to my letter stated that unfortunately the Canadian Standards Association had been unable to obtain complete support for this project. It went on to say that the Rubber Association of Canada had recommended minimum standards for new passenger car tires. Correspondence with the Rubber Association of Canada indicated that all tires manufactured in Canada after January 1st, 1966 would meet this minimum standard.

The Rubber Association of Canada is to be commended for establishing a standard on its own and the Canadian tire manufacturers deserve praise for accepting that minimum standard on a voluntary basis. But this in itself would not solve the problem. Inferior tires from other countries could be shipped in and sold to our people; and it is conceivable that tires could be made in Canada from old stock and there would be no mark on the tire to indicate that it met any standard.

I, and many others, I suppose, throughout Canada, continued to urge the establishment of a C.S.A. standard. The matter was raised at the Canadian Highway Safety Conference in Calgary in May 1966 and a resolution asking for a standard was passed.

I was very happy to receive a letter dated July 21st, 1966, from the Canadian Standards Association which included the following information, and I quote:

"The Canadian Standards Association wishes to announce that after considerable discussion with numerous Canadian interests, and the Canadian Government Specifications Board, authorization has been granted by the C.S.A. Board of Directors for the development of the C.S.A. Standard for automobile tires."

The Committee is now at work.

Questions properly asked are:

1. Why should the quality of an item as important to safe driving as the tires on our vehicles, be left entirely in the hands of the Rubber Association and the tire manufacturers?

2. Is the tire responsible for many accidents attributed to the driver or other causes?

The "C.S.A." mark on our tires to indicate its quality is long overdue and it is urgent that the standard be established before inferior tires that don't meet the standards elsewhere, are dumped into our market to be sold at bargain prices. It will be no bargain for Canada to save a few dollars and then kill or cripple the occupants of the vehicle.

(b) Again, vehicles are sold in many sizes and weights, with various sized engines, acceleration power and braking power. What in fact is the desirable

horse power of a car, of a truck and what constitutes adequate braking power? Should the size and power of an engine be in accordance with the size of the vehicle? Are some accidents attributed to driver error when possibly the engine of the vehicle was too powerful for the chassis or the braking power inadequate for the weight carried?

Research could bring out the true facts.

(c) We have no comprehensive statistics today that indicate the real cause or causes of traffic accidents and traffic fatalities. A busy police officer fills in the form with the most obvious cause or the driver who may have been responsible blames it on the steering or the road. It is most important and basic to the whole concept of highway safety to ascertain to the greatest possible degree, the true cause.

The Air Transportation System has an Accident Investigation Board to investigate aeroplane accidents. When the aeroplane crashed near Montreal killing some 100 persons, the Canadian Government put the plane back together, piece by piece, in an endeavour to find the cause at a cost I am told of some four millions of dollars. No criticisms of this action was heard from the Canadian taxpayers because it could well mean that never again will such a tragedy occur.

Careful organized research into the cause of traffic accidents that killed close to 5,000 human beings in 1965 should be given equal attention by the Canadian Government.

A national traffic accident prevention and research center could find the real answers to scores of unanswered questions that need to be answered.

The research in our country and in the United States and elsewhere could be co-ordinated to avoid duplication and to provide answers upon which legislation and policies could be based.

II. Investigation

Many investigations can only successfully be carried out by Government.

(a) A Legislative Committee was set up by the Alberta Legislature early this year to ascertain the reasons for the high cost of Automobile Insurance. Items 11 and 12 in the Report read as follows:

"The Committee looks with concern on the following:

(11) Contentions submitted to the Committee indicate that there may be a plan by automobile manufacturers to deliberately design vehicles in order to insure a built-in high profit from parts, etc.

The modern car is vastly different from the car of a few years ago; it now involves much chrome and the design of the body of the car makes it difficult to repair it.

For example, the inside of a panel must be cut off and then welded back on in many makes of cars; the electrical system is generally badly damaged when a door is damaged and becomes an expensive item to repair; the tail lamp because of its position is now invariably damaged on many cars when there is a rear-end collision. In cars of former days the replacement of a tail lamp cost \$2.00 or \$3.00 but now its costs as high as \$70.00 and \$80.00. By changing the position of the tail lamp many would not be damaged at all. Similarly, if head lamps were placed further back in the design of a vehicle, many would not be damaged through collision. It is noted that the cost of radiators has just recently increased by 12 per

cent. It now costs \$150.00 to carry out repairs to parts of the vehicle in front of the radiator. There are now even among models of the same manufacturer different types of radiators depending on the motors. Again, at one time a rear fender cost \$11.00. Now the whole panel must be replaced costing \$150.00 or more. The automobile window in a car now adds \$100.00 or more to the replacement costs.

The prices of parts are set at the factory. The Committee notes that some competition is in evidence, for example, one set of molding is priced at \$9.00 while another, claimed to be equally as good, is priced at \$4.00.

(12) The change of models every year by manufacturers.

This constitutes a large increase in cost initially and increased costs for parts thereafter."

Is there such a built-in plan to insure a built-in high profit from parts?

How can we find out? It is respectfully submitted that a Branch of the Canadian Government could investigate such matters and take steps to deal with the situation if a racket is discovered.

(b) This Branch could do the jobs mentioned and provide assistance without in any way duplicating the work assigned in our constitution to the Provinces or interfering in any way with the work of the Canadian Highway Safety Council which is an excellent national organization and doing a splendid job co-ordinating safety activities and providing incentive and leadership to voluntary groups across Canada, but which does not have the authority or the finances to do the work mentioned in this brief in research and inquiry.

Bill C-26

As the Committee is aware, the Canadian Government Specifications Board has held meetings this year and has been successful in recommending 27 standards. While these are intended to apply specifically only to vehicles to be purchased by the Canadian Government, other jurisdictions such as Provincial Government and Municipal Governments may also adopt them and so they could become universal in Canada.

Standards conspicuous by their absence include the following:

- (1) Defrosters for the rear window;
- (2) Recessed or safer door and window controls;
- (3) Padded back of front seat;
- (4) Location of cigarette lighters and ash trays;
- (5) Arm rests that will compress or squash in a lateral collision;
- (6) Head rests;
- (7) Side marker devices;
- (8) Fuel tanks and tank filler-pipes;
- (9) Outside ornamentation, accessories and protrusions; and
- (10) Rear luggage compartment barrier.

There is, of course, a danger in listing items in legislation. Some standards may be added, others deleted or changed and it is therefore much better to make the bill applicable to "Standards approved by the Canadian Government Specifications Board". This would have a further advantage as the finished product would have to meet the required performance standard as set out by the

Board. For example, one padded dash may look the same as another but one could be effective as a safety feature and another could actually be a hazard.

It is most essential that these safety items as recommended by the Canadian Government Specifications Board be standard equipment and not options.

And finally, I would strongly recommend that we establish adequate performance standards and not design standards. This will provide the inventive genius of our design engineers and others full opportunity to find better and then even better ways and means of giving the people the results they want.

I am not sure that adding a few safety features, piece-meal, is the real answer. I believe the manufacturers have design engineers who can produce a vehicle or vehicles as an entirely new package designed to protect the passengers much as an egg crate protects the eggs. It may or may not have a collapsible steering wheel, recessed fittings, shock-absorbing front end and all of the other safety items. In fact, we shouldn't be telling the manufacturer and design engineer how to do the job and what to put on the vehicle—we should tell them the result we want and let their technicians figure out ways and means of achieving that result.

If we can put men into space, surely we can design and build a vehicle that will protect its occupants from injury and death.

Until we take this approach, however, every safety feature added will help.

Bill C-49

The Vehicle Inspection crews of the Government of Alberta this year reported, in part as follows:

"1. We note that late model cars with set-in tail lights tend to fill up with road dirt quite readily and this reduces the density of the light considerably. This condition would lessen if the lights were flush with the body of the car.

2. This second point may not pertain to the design so much, but, it tends to create certain hazards. We feel that the new car is not receiving the type of final inspection that it should. Some new models are being tested with headlights out of focus, front wheels out of alignment and brakes not properly set up."

Bill No. C-49 is a type of negative legislation. It is doubtful if it would be used to any great extent even if it was enacted into the Criminal Code. It provides that as long as an executive officer or director of a corporation receives advice from an expert with respect to the safety of a vehicle, he is exempt from the provisions of the bill. Unfortunately, though true, some experts, in any field of endeavour, can always be found for a price.

The objectives of the bill however are good and I would suggest that these could better be met by setting out clearly the performance standards required and then provide penalties for failure to achieve the said standards. This could be done by amending Bill No. C-26.

Conclusion

The auto represents progress and it is basic to our way of life. More than 3,500 makes of cars have come on the market since 1895 and the end is not yet. Certainly Government should not do anything that will deter the inventive genius of our people for in that direction lies our greatest hope. Neither should

Government look for a scapegoat; nothing can be gained by pointing the finger indiscriminately at one group or another. Man is imperfect and there will always be accidents but there are reasons why the toll of human life from the auto is so great. We, in Canada have been lax in not finding the answers. They can be found by research and inquiry and then, if appropriate action to eliminate them or compensate for them is not taken, Heaven help us!

All of which is Respectfully submitted,

Gordon Taylor,
Minister of Highways,
Government of Alberta.

The CHAIRMAN: Thank you very much, Mr. Taylor.

It is our usual custom at this time to allow the members to ask questions of the witness. Before doing so, I would like to introduce Mr. J. J. Frawley who is legislative counsel for the province of Alberta. I think he is permanently stationed here in Ottawa to safeguard the rights and interests of the province of Alberta.

Mr. J. J. FRAWLEY (*Counsel for the Province of Alberta*): I would just make a slight correction, Mr. Chairman. I am not legislative counsel. There is only one of those, and he lives in Edmonton. I am counsel for the Alberta government, stationed in Ottawa. I live in Ottawa. I am very happy to come along with Mr. Taylor this morning.

The CHAIRMAN: Thank you very much, Mr. Frawley. I see Mr. Tolmie and Mr. Wahn. Has anyone else got their hand up? Mr. McCleave and Mr. Aiken.

Mr. TOLMIE: Mr. Chairman, as we all realize, there has been a great deal of discussion about the possibility of enacting a national safety code which would force manufacturers to incorporate certain safety features in automobiles. There has also been some discussion about the jurisdiction of the federal government to do this. There is a question of provincial rights.

When I was following your brief I was not sure about your view in this matter. Some people feel that national guidelines are sufficient. I would like to get your view or whether you feel that the only effective way to promote traffic safety would be to have a national, mandatory code, forcing manufacturers to incorporate into new vehicles certain minimum safety features?

Mr. TAYLOR: Yes, Mr. Chairman; we feel that the only logical way to build a safe car is to have it built under national legislation. It would lead to utter confusion if ten provinces each set out the requirements for a vehicle and they all happened to be different with respect to safety features and qualities and so on. The car manufacturer would be in an impossible position.

It is our belief that it is logical and reasonable for the federal government to set standards for a safe vehicle that are acceptable right across the nation.

Mr. TOLMIE: This would be a type of national code, and if a manufacturer did not comply with it, of course, there would be the right to impose penalties. Is that your view?

Mr. TAYLOR: I believe that penalties would be necessary.

Mr. TOLMIE: It has been my opinion that there are many more used cars on the road than there are new cars. If we are really serious about promoting traffic safety we should do something about the used cars.

Do you feel that, either through the provincial government or the federal government, there should be legislation making it compulsory for all owners of used cars to have certain minimum safety features incorporated into their cars?

Mr. TAYLOR: I believe that the program, starting from a certain date, would be applicable to car manufacturers, and I believe that this can only properly and logically be done from the federal level. However, when it comes to used cars I cannot see any reason at all why the provincial governments should not enact the necessary legislation for the life of those cars. This would eventually correct itself. For instance, we in Alberta this year are now preparing an act on used-car lots. We have had complaints from many of our people that they are buying, from used car dealers and from used car lots, vehicles that have faulty steering and faulty tires, and there was one that did not even have the tie rod properly fixed.

We feel provincial legislation must look after the vehicle once it enters that province and is used on the highways, streets and roads of that province. The maintenance of the vehicle is absolutely essential. You can make the best vehicle in the world and if it is not maintained, then you are not going to keep it safe very long. You can make the best tire in the world but if you do not inflate it properly, then it can become a hazard rather than a safety feature. We certainly think there is a place where the provincial governments have a very definite responsibility in maintaining vehicles at a high level.

Mr. TOLMIE: Does your present government have any proposed plan along this line?

Mr. TAYLOR: Yes, we have.

Mr. TOLMIE: We have stressed safety features in cars for years. I have always wondered if perhaps going to that extent, that is incorporating safety features, we may not be getting into a position where the driver himself or herself is lulled into a false sense of security, if we keep stressing the actual safety features, so that they believe that they are in a vehicle which eventually will not be involved in an accident and their degree of care diminishes. Has that been studied by your department?

Mr. TAYLOR: Yes, we have given a lot of thought and study to that. There is little evidence to show that the average driver would become more careless if he was in a safer vehicle. We have not found this attitude at all. The person who wants a safe vehicle is a careful driver. He realizes that if he goes without his seat belt tied up, without his lap belt on and so on, he can expect to be hurt if he is in a collision. There is a requirement on the part of the driver; but for too long and I say this with respect, we have simply parroted what has come from somewhere that the driver is responsible for 90 per cent of the accidents on our highways and streets. I cannot find any definite evidence of this. There has been no research to show. As a matter of fact, the research done by the Lytle group in the United States recently came out with the conclusion that there was no one single factor that they could put their finger on as being the greater cause of automobile accidents.

I think that we are going to have to recognize that the vehicle may have been causing a much higher percentage of our accidents than what we have been formerly led to believe. We may also have to come to the conclusion that the highways and roads have led to a much higher percentage of accidents than

before. It may be that many of our people were killed because of defects in highways or defects in vehicles and not because of their driving.

On the other hand, it may well be that many of our people were killed because a tire blew and this caused the collision that killed people in both cars when they collided, or that something went wrong with the steering; because after the crash up we do not check our vehicles. We do not know what caused it. We take the policeman's answer; sometimes the answer of the driver who wants to protect himself.

This is one of the reasons I would suggest, with all respect, ladies and gentlemen, that we need some grass roots research on this matter of accidents, so that we can get the answers that are not propagated by one group or another.

The CHAIRMAN: Mr. Wahn, from Rosedale, in Toronto.

Mr. WAHN: Mr. Chairman, it is St. Paul's, Toronto, but thank you for elevating my status.

Mr. Taylor's brief was most helpful to all of us. I was particularly interested in his comments on Bill No. C-49 which I have sponsored.

This bill, Mr. Chairman, provides, in effect, that a manufacturer is criminally responsible if he manufactures and sells a motor vehicle which is not safe, bearing in mind the conditions under which it is expected to be used. That is the basic provision in the bill. There is no subclause which exempts the company merely because the company establishes that expert advice had been obtained.

It was my thought that there would be an objective test, and the counts would have to determine upon the basis of independent testimony whether a particular car was dangerous, bearing in mind the conditions under which it was to be used. However, it seems to me it would be helpful if in addition to imposing criminal responsibility upon the company, we imposed criminal responsibility also upon the executive officers and directors who really control what the company does. This, of course, has to be done with a great deal of care because the general principle is that officers and directors are not personally responsible for the actions of the company. We did provide, in their case, as is done in the case of certain securities acts, that they can exempt themselves from criminal responsibility, if they can establish, in effect, that they took all reasonable measures to make sure that the cars produced by their company were safe.

You can imagine for example, a certain company might have directors who would not actually be actively involved in the production line and would have to rely upon expert testimony, with regard to the safety of the cars. But the basic principle is that the company itself is responsible if it puts out a car which is unsafe, bearing in mind the conditions under which it is expected that the car will be used. I would like to get Mr. Taylor's comments upon the validity of this as a general principle because the alternative, it seems to me, is to list specific safety features.

It seemed to me when preparing the draft bill that these might vary from time to time. We would expect continual improvement as speed of driving and road conditions change. It seemed that a general principle like this might be useful. It is based really upon the analogy of the other Criminal Code section which makes it a criminal offence for anyone to permit an unseaworthy ship to go to sea. It seemed to me that it should equally be an offence for a manufacturer to permit an unsafe car to go on the road. I was wondering if I could have Mr. Taylor's comments on that particular aspect of Bill No. C-49.

Mr. TAYLOR: Mr. Chairman, basically I am convinced, and I believe it has been proven by the study in New York state, that it is possible to produce a safe vehicle that will drastically cut down the number of people who are killed and the injuries of those who are in the car. If we accept the premise that a safe vehicle can be produced I think we are then on the right track.

If our legislation is going to require a performance standard, this would be a second step. After producing a safe vehicle, then I believe the government can properly be expected to say there must be a satisfactory performance standard met by this vehicle. If this becomes legislation, then, of course, there must be punitive sections, that would hold someone responsible. I think the manufacturer, basic to what you said, is responsible for the vehicle that he produces. This has been shrugged off in so many cases by simply saying the vehicle was safe but that it was improperly used by the person who was driving it.

I remember a vehicle that was produced a few years ago that in one year produced many accidents and the consensus of opinion of the mechanics with whom I talked was that this chassis was too light for the power of the engine. There have been other instances where a vehicle has been too heavy for the braking power. If the manufacturer had obtained the advice of an expert, who had signed an affidavit saying that such a vehicle was satisfactory, what would be the possibility of laying a charge and carrying out the penalty section? He would be protected by the person who signed this. Therefore, it comes down to a question of whether you prosecute the man who signs the affidavit. If you do not go that far, then anybody can sign a certificate and relieve the top executive of the responsibility.

Mr. WAHN: But the company would remain responsible.

Mr. TAYLOR: I fully concur with the suggestion that the company that manufactures a vehicle should, in the final analysis, be held responsible for the safety of that vehicle. If they have an inadequate braking system, or an inadequate steering system, or something else that causes the death of somebody, then they should certainly be held responsible.

Our suggestion on Bill No. C-49 is that we feel it would be better to have a positive bill setting out the type of vehicle you want, and then have penalty sections saying what would happen if this vehicle is not so produced. This embodies the general idea that you have in Bill No. C-49.

Mr. WAHN: My second question is this: Some models may be inherently unsafe. For example, I have been told that perhaps a convertible, or an open car, is more unsafe than a closed car. If you have a closed car it is possible, by properly enclosing the driver, to protect him in the event of collision, whereas a person in an open car is likely to be thrown out, or the danger is greater. Taking it to the extreme, I have been told that these very light motorcycles, for example, are the unsafest motor vehicles of all.

What is our thinking on this? Do we accept this because they are saleable and they are in demand by the general public, or do we accept the principle that there are some kinds of vehicles that are so inherently unsafe that they should not be on the highway at all?

Mr. TAYLOR: My comment, sir, is that some vehicles are safer than others. Certainly, there being no enclosure at all on a scooter or a motorcycle, a person is leaving himself open to much more severe injury than is a person who has an enclosure that has been well built to protect him.

I think there always has to be some responsibility on the person who is purchasing and the person who is going to use it. If I buy a sports car which is an open top convertible, then certainly the manufacturer should not be held responsible if I roll that vehicle and kill myself. Extra care is required when you are operating a scooter or a motorcycle, or a sports car. I believe that brings in the provincial legislation, where there have to be certain requirements of the person who is going to operate those vehicles, and certain regulations governing the use of them.

Mr. WAHN: This is my last question, Mr. Chairman, and it deals with the expense of safety features, I believe it has been said at times that to provide some of the safety features which have been recommended would greatly increase the cost of motor vehicles.

The witness has pointed out that great expense is caused because of frequent model changes. If we have to choose between frequent model changes and more safety built into vehicles, I gather that the witness would prefer to have greater safety built into the vehicles and fewer model changes. Am I correct?

Mr. TAYLOR: I do not think that we would ever want the Canadian government to get into a mould, where there is going to be one make of car, any more than we want to have ever woman and every man dressed in the same type of clothes, and so on. This is part and parcel of our makeup. We want differences. But these differences can be multiplied without infringing on safety, and I think you would find, gentlemen, that if we said to the manufacturers, "We have to have a safe vehicle which is going to embody these features that have been shown to be safe", they would find many, many ways and many, many different ideas for producing the same result. That is why I suggest performance standards—that they must perform in a certain way—and let the manufacturers find a way to meet those performance standards. I think you will find that they have a variety of ways.

With regard to cost, when I look at the standards that have recently been established by the Canadian Specifications Board, through committee hearings, I cannot see any tremendous increase in cost. We are simply asking them to do something in a way different from what many of them have been doing it. Is it going to cost more to do away with these recesses in the interior of a vehicle? Is it going to cost more to supply a collapsible steering wheel or some other type of steering rather than what they are supplying today? There may be some increase in cost, but, frankly, I do not think safety ever costs. Safety pays, for both the nation and the individual.

Mr. AIKEN: Mr. Chairman, I just have one subject which may result in two questions for Mr. Taylor.

He mentioned, in passing, the "vehicle inspection crews"—and those were the words he used, I think—and also indicated that there did not seem to be sufficient objective inspection of the causes of accidents and the vehicles themselves after the collision.

I was going to ask him, with particular reference to his own department, whether there is any inspection of vehicles after collision, except what is done by police officers?

Mr. TAYLOR: No; we do not have any set-up at all for the carrying out of a thorough inspection of a vehicle, to put it back together, to find out what caused

the accident. The only inspection that is done is by the police forces and by lawyers who are trying to prove a case, and so on.

Mr. AIKEN: The other related question is that he seemed to indicate a lot of drivers, being under the threat of either civil or criminal liability, do not give a reasonable explanation of what really happened.

Has there ever been any thought of allowing the protection of the Canada Evidence Act to extend to persons who are interviewed in connection with the cause of a collision, so that any evidence they give cannot be used against them in civil or criminal cases? This type of procedure seems to have been very satisfactory, for example, at inquests, and in fact this principle does develop at inquests in many cases relating to automobile accidents. But it is only after there has been a death. I am wondering if there had been thought given to some such provision?

Mr. TAYLOR: I cannot answer that fully. In many accidents where you want to find out the real cause, the only people who could tell you are dead, and in that case you almost have to put your vehicle back together to try to find a cause, the same as we do in airplane investigations.

Secondly, many of the witnesses who could tell you do not want to tell you. As a matter of fact, in many potential impaired driving charges, the person disappears and comes back and reports it the next day, within 24 hours. I think that the police and lawyers and the government—everyone—knows that the reason he did not report it before was, probably in 99 per cent of the cases, because he was intoxicated. He comes in the next day and has invented some reason for his not reporting it until that time.

I think it might help, in some cases, to have the protection of the Canada Evidence Act, and perhaps this is an idea that should be pursued. To my knowledge it has not been pursued up to this time.

Mr. McCLEAVE: Mr. Taylor, did you have manufacturers at this committee hearing that was held out in Alberta?

Mr. TAYLOR: On the insurance inquiry?

Mr. McCLEAVE: Yes?

Mr. TAYLOR: No, we did not have manufacturers there. We had auto body people and garage people, but we did not have manufacturers. There are actually no manufacturers in the province of Alberta.

Mr. McCLEAVE: I take it that there was a strong contention to the committee regarding safety features, or the lack of them, in automobiles, and about factor in-built to cause excessive cost in repairs, and the like. I think many of the points raised there would be very helpful if we could have them before we go to our Windsor-Detroit junket. Would it be possible to furnish us with a transcript of the proceedings? Perhaps some of us could go over it and take out some points for the examination of the witnesses in Detroit.

Mr. TAYLOR: We would be glad to let you have a copy of the report. There was no actual verbatim record of the proceedings.

Much of the information that pertains to this particular item came from the representations made by auto body people. I was the Chairman of the committee and we wanted to know why the cost of parts was so high. We felt that this was very relevant factor in cost of insurance. Some of the reasons given by the au

body people for what they had to do led some of them to the conclusion, and also led us to the conclusion, that there could well be a built-in plan to ensure that there is always going to be a very high profit from parts.

When I look at the facts and figures of the Canadian automobile industry, I notice that in 1966 there are more than \$867 millions of dollars of parts imported. This in itself does not prove very much, but it does show that there is a very, very high volume of business being done in parts every year.

Our point here is that unless some government authority pursues this and investigates it right down to the grass roots, we will never know. Perhaps there is a racket going on, which is being carried on at the expense of our people.

As a matter of fact, I have a copy of that report here, and would be very happy to give it to the Chairman.

Mr. McCLEAVE: My final question, sir, is: Did any of these auto body repair people come forward and present briefs, apart from oral testimony to your committee?

Mr. TAYLOR: No, they did not present briefs; they presented oral testimony and we kept notes on what they submitted and then summarized it.

Mr. MACEWAN: Mr. Chairman, I would like to refer to page 2 and to the two suggestions made by Mr. Taylor that there be a traffic accident research centre, plus a central traffic branch, in some department of the federal government, to carry out investigation. If this were set up, Mr. Taylor, how would this be tied up with your various provincial governments? What would be the liaison with, say, your own Department of Highways in the province of Alberta?

Mr. TAYLOR: If there was a central traffic research centre established in Canada, we would then refer matters to that centre, or we would certainly give that centre complete freedom to investigate any accident that happened on the highways and streets of Alberta.

There may be some that we might consider to warrant special study and we would bring them to their attention and co-operate in every possible way.

I believe, from having been at meetings of the ministers of transport from the 10 provinces and also the ministers of highways from the 10 provinces, that you would find 100 per cent co-operation in this type of procedure. This investigation is not being carried out today largely, I suppose, because of the cost and because of the scarcity of people who have the know-how to do it. It seems to me that attaching it to the National Research Council would be the first step, because the National Research Council works very closely with the research councils of each province, and that could be another liaison.

When an accident involving death happens on a highway or road in Alberta we immediately have that area investigated from the highway point of view, which is our full responsibility. If there is any clue at all that indicates that the highway was in any way the cause, our engineer is then held responsible immediately to correct whatever that was.

I do not know of an instance of this, but say there was a case of bleeding asphalt. Sometimes this can take place suddenly. Someone may be killed before it is even reported. This would have to be corrected immediately. It might be too sharp a curve, or it might be that the signing was wrong. But when it comes to the vehicle, we do not have someone going out and saying: "Did this vehicle

cause this?" and going over the vehicle in detail to find out if there was something wrong with it.

Mr. GRAFFTEY: What does the term "bleeding asphalt" mean?

Mr. TAYLOR: When you put on asphalt it solidifies and becomes solid. When you are building in asphalt there are certain things that happen that sometimes bleed the asphalt and loosen it and then it becomes a fluid again. That fluid is on the top, and if you hit that at 60 or 70 miles an hour, you know what could happen. This is just one of many, many things.

The point I am trying to make is that we now have the know-how and the machinery to investigate the highways, but we do not have the know-how and the machinery to investigate the vehicle, and this is what we would like to see done. I think there would be 100 per cent co-operation among the provinces.

Mr. MACEWAN: Following Mr. Tolmie's original questions, am I correct that you believe, as far as the safety features in a car are concerned, that they should be obtained by way of a national safety code?

Mr. TAYLOR: So far as the producing of safe vehicles is concerned, I believe emphatically that this can only be achieved if we have national legislation.

Mr. MACEWAN: Did you have occasion to read the brief that was presented to this Committee by the Canadian Automobile Association?

Mr. TAYLOR: No.

Mr. MACEWAN: If I can recall correctly the evidence—and of course the evidence will speak for itself—this association did call for a national safety code in time, but they suggested that the first step be by way of setting up a council which would consist of governments at all levels and this council would then go into such matters as you set out here, and then the results of that would be forwarded to governments at all levels.

If a national safety code could not be effected at that time, I wonder if an organization such as the C.A.A. suggested might be at least an initial step in this direction? Have you any comments to make on that?

Mr. TAYLOR: Frankly, Mr. Chairman and gentlemen, I believe we stand a good chance of becoming top-heavy with organizations. Today we have a research council in Canada in each of the provinces. We have the Canadian Highway Safety Council which is supported by the federal government and all 10 provinces and industry, and which are in close liaison in trying to co-ordinate the safety factors across Canada. What we do not have are a national research centre and a national inquiry centre, and I frankly believe that the answer is to establish the things that we do not have instead of setting up another organization that is going to do many of the things that are presently being done.

Mr. MACEWAN: Finally, in regard to page 7—I think Mr. Wahn asked questions on this—you say:

And finally I would strongly recommend that we establish adequate performance standards and not design standards.

I suppose, in a nutshell, you could say, "Something with fewer frills perhaps will make fewer bills", or something like that.

Mr. AIKEN: Mr. Chairman, may I ask a supplementary question?

You would suggest, Mr. Taylor, that one organization—perhaps the National Research Council or the Canadian Government Specifications Board—should be authorized to set up minimum standards for new vehicles for national use in Canada?

Mr. TAYLOR: Yes.

Mr. HONEY: Mr. Chairman, Mr. MacEwan dealt with the question I had in mind with respect to the degree of co-operation, and I am pleased—and I know the Committee would be pleased—to have the answer that the federal agency doing research into the causes of automobile accidents has received full co-operation from the province of Alberta, and presumably from other provinces also.

The only other matter I wanted to mention was this: Would you, Mr. Taylor, go so far as to say, with reference to the establishment of performance standards by an agency—whatever agency it might be in this case—that this agency should, constitutional matters aside, have the authority to require, or issue, a certificate before a new automobile can be offered for sale? Would this be one way in which the agency could ensure that the automobile in question met the minimum performance standards which you suggest as a test?

Mr. TAYLOR: Well, frankly, I do not know what the mechanics would be, but I do feel very, very strongly that if any manufacturer, or any design engineer, is deliberately building a weakness into a vehicle that is going to take the life of a human being, no punishment is too great for him. This would be “blood” money of the worst kind.

Now, the mechanics of dealing with this would, I think, have to be thought out very, very carefully, but I believe that, (1), our legislation requires the construction of a safe vehicle which is going to protect the occupants, and (2), to the greatest possible degree, and that in the case of (2) we leave it to their design engineers to determine how they are going to meet these performance standards; and there would have to be a punitive section setting out what would happen if they did not meet those performance standards. I believe that punitive section is just as necessary as the positive section saying what the performance standards are going to be. I think that punitive section should be very severe, because, as I have said before, I do not think any punishment is too great for somebody who tries to make money by killing other human beings.

Mr. HONEY: Do you not think we could probably avoid the necessity of a punitive section—although it might not do any harm to add it—if we took a more direct approach and said: “No automobile manufacturer may offer an automobile for sale unless it is certified by “(this government agency)”—as having met, or as meeting, the performance standards set by—“(this agency)”? In other words, if we believe that it is in the public interest that no automobile be offered for sale unless it meets these standards, it would seem to me—and I would like your comments on this—that this would be a better and more direct approach than setting up the standards and providing a penalty for any manufacturer who did not meet them. This might mean the loss of some lives before we got around to implementing the penalty through prosecution.

Mr. TAYLOR: Mr. Chairman, and hon. Members, with respect, I personally do not think that that would be the best way to do it. If you did it that way the government would, in the final analysis, have to take the responsibility. Second, the government would have to employ top technicians of every type. I do not

think the government should be required to do that at the expense of the general public.

I think the government has the responsibility of saying what the performance standard is, and then surely those who have the know-how, who have the technicians, who have the design engineers, can meet that requirement and if they do not meet it let them take the responsibility. Let us not switch it over to somebody in government who issues a certificate after the thing is all made. In other words, I believe that the industry itself must take the responsibility for what it builds, and that the government should set up the standards to which it wants that vehicle to perform.

Mr. McQUAID: My question may have been partially answered by Mr. Taylor, Mr. Chairman, in reply to a question from Mr. MacEwan.

Mr. Taylor's brief acknowledges on page 2 that there are many interlocking factors contributing to these accidents on the highways, among which he has mentioned the design and construction and maintenance of highways.

I would like to ask him if he thinks that our various provincial governments, and our cities too, in the construction of highways are taking the proper measures to ensure the maximum safety of users of the highways, taking into consideration, of course, the speeds at which vehicles are almost bound to travel on these vastly improved highways. Do you think that proper precautions are being taken by—

Mr. TAYLOR: I can say that right across Canada there have been tremendous strides made in the last several years in the matter of building safety into the very fibres of our highways.

This has been done through a number of agencies. Each province has a very high calibre type of engineer in their highway department and, in addition to that, through the auspices of the Canadian Good Roads Association, we have established committees for setting up geometric standards and every other type of standard for highways. These have been adopted unanimously by the 10 provincial governments and by our large metropolitan governments as well.

There has been tremendous progress made in the actual construction of highways, and also tremendous progress in the know-how of what to do.

In the signing of highways, we have our own Canadian sign manual today that is standardizing signs and making signs uniform from St. John's, Newfoundland to the Pacific ocean. There has been tremendous progress made here. I am not going to say that we have found all the answers but I think we have most of them.

However, one other thing enters into it. We know that when we build a divided highway or a freeway today, as set out in the standards of the Canadian Good Roads Association, that immediately we are going to see a tremendous reduction in the number of fatalities and accidents.

For instance, on the highway that once existed just a very few years ago between Calgary and Edmonton, which is a two-lane highway, generally, with eight or 10 foot shoulders, there were a lot of people killed. We now have either an expressway or a freeway replacing that highway, and the death toll has dropped to practically nil although the traffic has increased. This has been the experience wherever you have constructed a freeway separating your traffic

with no vehicles darting in from the sides; you immediately have a tremendous reduction in your accidents and in your fatalities, sometimes almost right down to nil; but general experience is that accidents have been reduced by two-thirds of those on an ordinary highway. You immediately reach the conclusion: "Well, if we built divided highways or freeways everywhere we could drastically cut down our accidents and fatalities," and this is right; but, the truth of the matter is that you are always bound by economics. You cannot afford to build freeways unless you have a volume of 10,000 or 15,000 vehicles per day. Now, what can be done on the other highways to get this same result.

Mr. McQUAID: That is what I am particularly interested in. I realize that the freeways, of course, are being made as safe as it is possible to make them. I am thinking more of the roads which are not freeways, the ones which are built through rural areas in the various provinces. I am wondering if the cost factor enters into it very much there. For example, there may be what is considered a slightly dangerous curve, and it will cost a lot to take it out. Is there a tendency on the part of governments to leave that curve in and take the chance?

Mr. TAYLOR: I do not think so, in the construction of main and secondary highways. I know what I have done—and I think the other nine provincial highways ministers have done the same thing—and that is that instructions have gone to the engineers that cost is not to be considered in designing a highway when it comes to a matter of life and death, or causing an accident or not causing an accident.

I think, possibly, to a degree, money will enter into it on rural roads in a rural municipality where there is a limited amount of money. I have seen evidence there of very sharp curves. When questioned about it they have told me that they did not have the money to round it out. It costs a lot more to put in a proper curve. It takes more dirt. It takes more right of way, etc. Therefore, economics are certainly a feature in regard to construction of safety into highways and roads but I do not know of any province in Canada today that is using this excuse for designing bad main highways and secondary highways. I believe we would all much rather build fewer miles and build safety into them than to build many miles with sharp curves and improper grading, etc.

Mr. McQUAID: I have no more questions, Mr. Chairman.

Mr. GRAFFTEY: Mr. Taylor, I have just had the opportunity of reading your brief and I am not surprised at its excellence because I have seen you performing in the Committee here in Ottawa over the last number of months, and I want to pay tribute to you before this Committee, not only for the excellent brief you have presented to us, but for the work I know you have been doing in the Standards Specifications Committee over the last months.

Probably nobody has a greater experience involving the three elements in the epidemic than you do, sir—the car, the driver and the road. You certainly show that in this brief.

I am not being controversial. As a federal legislator I have often been accused of just pointing my finger at the vehicle and the industry. I am not trying to do this, and you have had a great experience in these meetings. You have seen the point of view of the industry and how much they are willing to move. In 1965, Senator Kennedy, before the Senate Commerce Committee in the United States Congress, in testimony he received from the executive of G.M.,

found that they were spending only about \$1 million point something on automobile safety research, and that their profits were around \$2 billion.

Do you feel, sir, from what you have experienced in committee meetings, that the automobile industry has done enough significant safety research to merit our visting their establishment in Detroit and Windsor? I know that a great many of the United States legislators have refused to go because they know they are spending so little. Do you think it would be preferable to insist that they come and testify before this Committee, rather than that we go down there—unless, of course, they have done a great deal more in the last year than they have done previous to the year before? Do you have any information, sir, that would indicate whether it would be worthwhile for this Committee to take two days off to go down to Detroit or Windsor, as the case may be, and spend this amount of time seeing what could be the relatively little research that is being done at the present time?

Mr. TAYLOR: I really do not know that I am fully qualified to answer, but my own view on it could be summed up, I think, in three observations.

(1) I believe that the car manufacturers could properly have spent much more money on research, and that they could have included in vehicles safety features that long ago were known and which they did not include;

(2) I believe they have done some very excellent work on certain types of research at Windsor and Detroit.

I personally have seen some of it in Detroit, and I was impressed with what they were doing. I would think that the money and the time would be well spent for your Committee to go down and see exactly what is going on there.

(3) I believe this Committee would be well advised to call these people before it for enquiry, and with the knowledge that you have gained from the various representations here and your knowledge of what is actually going on there, I think it would put you in a very, very excellent position really to get the information your Committee is looking for.

The CHAIRMAN: Mr. Tolmie, do you have a question?

Mr. TOLMIE: Mr. Taylor has answered my question, in effect. My reaction to Mr. Grafftey's statement was that, of necessity, we would not be able to make a statement on whether or not it was worth while until we had actually gone down and seen it. I think Mr. Taylor actually answered that.

Mr. WAHN: I have just one last question, Mr. Chairman, to ask the witness.

Would it not be helpful, Mr. Taylor, if we had legislation which would provide, in effect, that any company that manufacturers and sells a motor vehicle which is not reasonably safe for use on the highway is guilty of a criminal offence, and could not the question determine whether or not the motor vehicle is reasonably safe for use on the highways under existing conditions be left to a court which could take evidence from independent government standards boards which might be established, and also from any other sources which might be relevant? Would that at least not be a step in the right direction?

Mr. TAYLOR: Yes, I would certainly say it would be a step in the right direction. I believe even if nothing else at all were done now, it would certainly be a big step in the right direction. If, however, the Canadian government sets up performance standards and a punitive section, etc., as was set out previously.

Mr. WAHN: But no motor manufacturer would want to have a criminal conviction against it for producing and selling an unsafe motor vehicle. It seems to me that it would be a tremendous incentive to them to produce a motor vehicle which did meet satisfactory performance standards. The danger of anything happening, from a public relations point of view, would be extreme, I would have thought.

Mr. GRAFFTEY: From your experience, Mr. Taylor, and from the meetings that we have all been through, do you feel that the standards we develop must be such as to bring the building of the automobile under the rule of the law, and that public authorities must act—and I am not blaming the industry for this because it is perhaps through a set of circumstances that the automobile industry in general will not act voluntarily, or fast enough, to reach the goals that we are going to have to reach to reduce the epidemic—do you have the feeling, after these meetings, that there is certainly a responsibility to legislate, in that the industry itself will not move unless forced to?

Mr. TAYLOR: Oh, very much so. I believe that legislation is necessary, whether it is of the type suggested by Mr. Wahn or the other type that we have discussed here. I think that legislation is vitally necessary, vitally important, and that it is essential in Canada now.

The CHAIRMAN: That seems to conclude the questioning.

Mr. Taylor, may I thank you for your presentation. You have been asked questions by every member in the Committee so you know just how vitally they are interested. I do not think I can do better than adopt the words of Mr. Grafftey about your experience. We thank you most sincerely.

I hope, Mr. Frawley, that the rights of the province of Alberta have been well protected, and, of course, we are very glad indeed to see you here.

Thank you very much, gentlemen. The meeting is adjourned.

**OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE**

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE
ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 17

TUESDAY, NOVEMBER 22, 1966

Respecting the subject-matter of
Bill C-87, An Act to amend the Criminal Code
(Impaired Driving)

WITNESSES:

H. Ward Smith, Ph.D., Forensic Scientist, Director of the Ontario Attorney-Generals Laboratory; and *From the Canadian Highway Safety Council:* Mr. P. J. Farmer, Secretary General.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron (*High Park*)

Vice-Chairman: Mr. Yves Forest

and

Mr. Aiken,
Mr. Choquette,
Mr. Chrétien,
Mr. Fulton,
Mr. Goyer,
Mr. Grafftey,
Mr. Guay,
Mr. Honey,

Mr. Laflamme,
Mr. Latulippe,
Mr. MacEwan,
Mr. Mather,
Mr. McCleave,
Mr. McQuaid,
Mr. Nielsen,
Mr. Otto,

Mr. Ryan,
Mr. Scott (*Danforth*),
Mr. Tolmie,
Mr. Trudeau,
Mr. Wahn,
Mr. Woollio,
Mr. Woolliams—24.

(Quorum 10)

Timothy D. Ray,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

TUESDAY, November 22, 1966.

(21)

The Standing Committee on Justice and Legal Affairs met this day at 11.15 a.m. The Chairman, Mr. Cameron presided.

Members present: Cameron (*High Park*), Choquette, Forest, Guay, Honey, MacEwan, Mather, McCleave, McQuaid, Ryan, Tolmie (11).

In attendance: Mr. H. Ward Smith, Ph.D., forensic scientist, Director of the Ontario Attorney-Generals Crime Laboratory; and *From the Canadian Highway Safety Council;* Mr. Philip Farmer, Secretary-General.

On motion of Mr. Forest, seconded by Mr. Ryan,

Resolved,—That reasonable living and travelling expenses be paid to Dr. Ward Smith who was called to appear November 22, 1966.

On motion of Mr. Mather, seconded by Mr. Wahn,

Resolved,—That the Clerk of the Committee travel to Windsor in advance of the Committee in order to finalize arrangements for the proposed trip of the Committee to Detroit-Windsor for the purpose of investigating and holding hearings on automobile safety.

The Chairman announced that the itinerary for the Committees proposed visit to the Detroit-Windsor area is now finalized and that the Members would be receiving them today.

The Chairman introduced Mr. H. Ward Smith, Ph.D., and Mr. Philip Farmer. Dr. Smith was invited to make a statement, followed by which, he was questioned by the Committee.

Following discussion,

Agreed,—That *Methods of Forensic Science*, Volume IV, by Dr. H. Ward Smith be made an exhibit (*See Exhibit 14*).

Following discussion, Mr. Farmer agreed to provide the Committee with copies of the *Grand Rapids Study* at the next meeting.

At the conclusion of the questioning, the Chairman thanked Mr. Farmer and Dr. Smith for their attendance. He expressed the appreciation of the Committee to Dr. Smith for taking time to reappear before the Committee to answer further questions.

At 12.40 p.m., the meeting adjourned to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY November 22, 1966

The CHAIRMAN: Gentlemen, we have a quorum.

The first matter of business is the need for a motion that the reasonable living and travelling expenses be paid to Dr. Ward Smith who was called to appear before this Committee on November 22, 1966.

Mr. FOREST: I so move.

Mr. RYAN: I second the motion.

The CHAIRMAN: Are there any comments on the motion?

Motion agreed.

The CHAIRMAN: Also, we require a motion that the Clerk of the Committee travel to Windsor in advance of the Committee in order to finalize arrangements for the proposed trip of the Committee to Detroit-Windsor for the purpose of investigating and holding hearings on automobile safety.

Mr. MATHER: I so move.

Mr. WAHN: I second the motion.

The CHAIRMAN: Is there any discussion?

Motion agreed to.

The CHAIRMAN: The itinerary for our proposed trip to Windsor is now finalized, and I trust that you will be receiving a copy in the mail today. I would ask that every member who intends to go make his intentions known to the secretary as soon as possible. May I say, Mr. McCleave, the trip is shaping up, in a liberal way, much better now. We anticipate it is going to be a very worthwhile and a very educational trip. I hope that every member who possibly can will take advantage of this opportunity.

I would like to introduce Mr. Farmer of the National Safety Council who is here today. The Canadian Highway Safety Council will be before the Committee on Thursday of this week to discuss with us Bills No. C-26 and No. C-49 regarding automobile safety devices.

Our witness today is Dr. Ward Smith, forensic scientist, Director of the Ontario Attorney General's Crime Laboratory. He is going to discuss with us Bill No. C-87. Dr. Smith was with us several weeks ago. He is an outstanding authority on the subject that he will be dealing with, and it is a great pleasure once again to introduce Dr. Ward Smith to this Committee.

Mr. WARD SMITH (Director, Ontario Attorney General's Crime Laboratory): Thank you very much Mr. Chairman.

Gentlemen, I appreciate the fact that there is a quorum here this morning, knowing full well that there are so many Committees meeting

today. It must be very difficult for you gentlemen to make all of the rounds that you have to make. I appreciate your presence here.

As you know, I am here primarily to deal with evidence that is already before the Committee, I have had the opportunity of reviewing some of this evidence since eleven o'clock last night. There are just one or two comments I want to make about it, and also to relate to you some studies which were done on Thursday of last week on racing drivers, who actually drove the track at speed and to indicate to you some of the outstanding findings which bear on the matter under discussion I would like to make those two points and then I will be available for questioning.

I found Professor Rabinowitch's presentation a very strange one indeed. I think Mr. Honey, one of the members here, went to the very root of the matter. His question was with reference to arterial blood and whether the breathalyzer would be accurate enough for the purposes of justice if arterial blood was implied. Professor Rabinowitch answered, "yes, if it is arterial blood."

Now, in that he has indicated and really summarized all of his preceding ramblings on the question of correlation between breath and blood and also the question of the ratio between the amounts of alcohol appearing in breath and those appearing in blood, because it is in fact arterial blood that we are measuring when we use a breath test—and if the bill can be arranged such that arterial blood is implied, then there will be no argument or discussion on this point.

In his discussion and comments on the immorality of using the breathalyzer in court, as I said, his assessment of correlation of breath and blood, the possibility of error in the breathalyzer which he dramatically indicated might be as high as 2 and 12, all hinge on whether arterial blood or venous blood is implied. This position is outlined, as I have outlined it, in a chapter in a recent textbook on the subject, and I will for the record read it because it is a very short presentation. It is subject to the comments and criticisms of my fellow scientists. It does represent a summary of the findings on this particular matter, acceptable to all who have seriously studied this field and, therefore, open to criticism by any in the world who care to criticize this. It has been received as representing the work on the subject.

The concentrations in the breath are governed by a process of diffusion and are the concentrations expected from a consideration of Henry's law, which really states that once you fix the liquid and the type of material you are dealing with then the only variables that enter into the relationship, in this case between breath and blood, is the concentration in the blood and the temperature. Since the body temperature is practically constant, this equilibrium value is predictable. While there are practical difficulties in obtaining an accurate measurement in this relationship, recent work confirms the studies made in 1930 that 2100 millilitres of alveolar air contain the same amount of alcohol as 1 millilitre of blood. Professor Rabinowitch had reference to these studies made by Professor Liljestrand in 1930. He did not indicate, however, that as early as 1930 Professor Liljestrand, based on these studies, outlined all of the mechanics for developing a whole system of breath testing in Sweden at that time, which I think is an indication of how well Professor Liljestrand felt that these relationships applied. They applied well enough that he was prepared to develop this kind of breath

testing system. However as you know, Sweden focussed on a blood test which for them is merely taking a sample from the ear by pricking the skin, and this made the breath testing unnecessary there.

This relationship of 2100 to 1 has been verified by thousands of tests since they were first introduced in 1938. The most recent of these is one in which the conditions were very carefully controlled and the relationship between breath and blood which indicate the precision is such that the agreement between them is within plus or minus .01 per cent; that is, if you have a reading of 10 then the true reading could be anywhere between .11 and .09. This would be at the level of predictability of 1 in 1,000. In other words, only one result in a thousand would lie outside those limits by as much as .003 per cent, which makes it one of the more accurate analytical procedures and confirms this ratio very closely indeed.

In spite of that, the technical and scientific literature abounds with correlation studies done using various breath tests and various methods of analyses employing venous or capillary blood. Professor Rabinowitch had summarized and quoted some of these. For the most part, these correlation studies have been done under conditions in which as the result of a rapid absorption of alcohol from the stomach and intestines into the blood, one would not always expect agreement between venous blood concentrations and the arterial blood concentrations and the latter which is an equilibrium with deep lung air.

It is well known that during the early phases of the absorption of alcohol there is a possibility, and in many instances the high probability, that arterial blood will contain appreciably higher concentration of alcohol than will the venous blood. The concentration of alcohol in arterial blood is, however, a much more accurate indication of the concentration of alcohol being delivered to the brain, and it is this concentration that controls the behaviour patterns of the individual. In this respect, breath tests, in so far as they accurately reflect arterial blood concentrations, should be more desirable than blood tests using venous blood.

I will leave that with the Committee so that when we deal with arterial blood then this resolves any discussion there has been of correlation studies and these things that Professor Rabinowitch has brought before you.

In passing, it is interesting that Professor Rabinowitch referred to Professor Ferguson when he spoke about seeking him out to appear on a medical committee. Now, he must have known Professor Ferguson's views, since these views were stated in a case *Regina versus McLean* in which Mr. Justice Judson, now of the Supreme Court of Canada, sat on the Bench.

Professor Rabinowitch was in the courtroom. In this trial the Crown provided its case. It represented the first Supreme Court case trial involving the breathalyzer in this country. On returning from Ottawa, Professor Rabinowitch called me to express his satisfaction with the use of the breathalyzer, and outlined four points which I had also made in my previous submission to this committee; one, that the term "venous" blood should be deleted from the bill; second, that two tests should be used. The reason for two tests is the remote possibility that a person might regurgitate at a time when there is alcohol in the stomach and this could falsely affect the results. Professor Rabinowitch knows all well about this and has emphasized this point. It was the point made in the

case Regina versus Nault in magistrate's court here in Ottawa. It was in this case where Professor Rabinowitch finally admitted the very close correlation between arterial blood and breath tests. I might also add that this case was resolved in favour of the Crown.

The third point was to make possible the use of blood and urine tests as well as breath to confirm any results that are found. On the question of confirming these tests by means of a breath sample, our studies on the saving of a breath sample indicate that there is a method which is satisfactory for this purpose that is, to collect a sample on absorbent material so that as long as ten days later this alcohol can be released from the absorbent material and measure in the breathalyzer, and this measurement at that time agrees very well with the measurement made initially with the breathalyzer. And it would then be possible to seal this sample which is in a short glass tube. It can be sealed, properly identified, properly numbered so that its continuity can be preserved so we know that, in fact, this sample was the one obtained from such and such a person and satisfy those requirements in the court in terms of continuity. I think this is extremely important in this matter so that no one is fooled by the possibility of a false analysis. I would think that these analyses could well be done under code number by any of the laboratories devoted to this purpose, including our own, so that the results would be returned to the accused under a code number, provided that his lawyer or the person himself could assure us of the continuity of the sample.

His fourth point was to delete the term "impairment". As you know, he feels that the variation in people is such that one cannot say that impairment would always exist in the heaviest drinkers and the best drivers at any particular level. In this there is an area of disagreement. I feel it might be useful to avoid the term "impairment" because people do not like to be labelled this way; it evokes a sort of contest and it may be well to delete the term from that point of view. But it does bring up the question of at what point does impairment in driving ability occur in a person. It is on that point that the studies which we have done recently have quite a bearing.

You will recall that when I appeared before the Committee the last time in answer to the question of whether impairment was present at .08 per cent, I felt that it, in fact, might well be but that our studies to date did not go that far because of the many factors lacking in these studies. One of the factors that was lacking was the question of actual driving under conditions where speed is a factor, and in our recent studies we have included this. We have actually taken racing drivers, some of whom were heavy drinkers, had them drive a test course, both sober and after alcohol, at speeds which were posted at 30 miles an hour in some areas and 60 miles an hour in others. When you introduce this question of the motion of the vehicle you find some very surprising things, one of which is the failure of the human organism under alcohol to appreciate the position of the car, especially on a curve. So even the racing driver who ordinarily is driving partly as the terms goes, by the seat of his pants feeling the motion of the car and anticipating what needs to be done by means of correction of the wheel, under alcohol does not seem to have this feeling. It may well be dulled to the point that he now does not have the sensation of imbalance, and can only use the visual clues to guide him in straightening his car.

So his reactions on the wheel are very rough indeed in adjusting for a curve, and they come late. This coupled with the fact their judgment was impaired, often resulted in their going into these curves at much too high a speed, then getting themselves into a position of imbalance because of the failure to appreciate the position of the car, using only the visual clues, as a result of which their entrance to this curve and procedure through the curve was very rough indeed. They were able to do it only because of their inherent skill. The normal driver encountering those conditions would most certainly have disastrous effects.

There was one thing that showed up that has not yet shown up in any of the previous studies, and if we were able to couple this with the diminished number of clues that one would have in night driving, which after all is where most of the driving after alcohol is done, then we compound all of these things and have a much more potentially dangerous situation. The result of these pilot studies was interesting. After all we only had eight people, and they were all "cup" winners in terms of their ability as racing drivers. One of them could consume three-quarters of a bottle of whiskey in an evening, and even on him impairment was evident at .08 per cent. In the others it was evident at levels down to .04 per cent. So introducing this factor of speed, we find a new dimension—for scientists that is—in this question of drinking and driving, which indicates that the level as proposed in this legislation is not too low a level but rather that subsequent research may well show that it may be too high, that in a majority of drivers, impairment may well be evident at levels of .05 per cent. However there needs to be much more research on the topic before a statement of that kind can be supported. But in view of the preliminary results of this pilot study, I feel now that .08 per cent is not too high a level to set for the kind of legislation you gentlemen are considering.

I thank you very much for the opportunity of making this short presentation this morning. I will endeavour to answer any questions that you might care to ask.

The CHAIRMAN: Thank you very much, Dr. Smith.

Mr. Tolmie has his hand up for the first question. If other members will indicate I will call them in the order in which I notice them.

Mr. TOLMIE: Dr. Smith, I think all of us realize there has been a continuing feud for years between yourself and other medical specialists and Professor Rabinowitch. When he gave his evidence he kept reiterating one point. What he said, in effect, was that with a specialist's knowledge in metabolism he was the best versed in this particular field. I gathered from his explanations that all other medical doctors were not as well qualified because he had this special field. He seemed to emphasize the point that there were other doctors involved, pathologists and other specialists, but that in addition to this special field he had worked with diabetes which gave him a special category, a special position. Therefore, his argument was that if that is so, then his evidence has more weight and he should be listened to more than other competing specialists. I would like to get your view on that as a doctor.

Mr. SMITH: Well, I am one of the people to whom he refers because my doctorate is not a medical degree. I am a social professor of pharmacology. I studied the action of drugs, having worked in this field now for 25 years, having

published a number of scientific studies in the field, and I am continuing in the front line, as it were, the research in this field. When Professor Rabinowitch has been approached, as he has many times to appear with fellow scientists in this field, he has declined. For example, as chairman of the meeting of the Second International Conference on Alcohol and Road Traffic, which took place in Toronto in 1952, I gave him six months' advance notice of the meeting and I gave him a choice of three dates on which he could come and present his views and discuss this thing with fellow scientists from all over the world. He declined this invitation. In addition, you have the medical bodies, the American Medical Association, the Canadian Medical Association, the British Medical Association, all indicating that certain concentrations of alcohol should be accepted as indicating impairment in drivers.

In the most recent issue of a booklet of the British Medical Association, copies of which I think were made available to this Committee, their views are outlined and they come out in favour of legislation which would call for a .08 rule. It seems to me, on the one hand, we have Professor Rabinowitch and, on the other hand, all of those who have seriously considered this matter from a number of countries all over the world who hold quite contrary views.

Mr. TOLMIE: That was, of course, my reaction. He seemed to be clinging to this one special distinction and I wanted to know briefly whether a specialist in metabolism was better qualified than a specialist in, say, pharmacology.

Mr. SMITH: Well, metabolism is one phase of the study of the effects of drugs on a person; it has to do with the handling of the drug by the body. Pharmacology also involves the reaction of the drug on the person. So from that narrow point of view that he makes, if anything, the pharmacologist should be better qualified.

Mr. TOLMIE: I can see the cleavage of opinion there but I wanted to get an answer. A defence counsel appeared before us a number of weeks ago but I cannot recall his name. He produced what to me was rather astounding evidence to the effect that a very, very small percentage of accidents, including fatal accidents, are caused by drivers who drink, but that a great percentage of accidents are caused by lack of care by the individual and this has been reinforced by many magistrates with whom I have talked. This, to me, was a rather shattering piece of evidence, if it is true. Evidently, he got statistics from the police department and also from the Attorney General's department. If this thesis of his is so, then the breathalyzer test and all this argument about it loses some of its urgency. What is your comment on that?

Mr. SMITH: At a time when efficient statistics in the Department of Transport indicated that one per cent of accidents involved a drinking driver I did a study in Toronto in 1950, where we actually surveyed all of the drivers involved in personal injury accidents in a three month period, and we found 15 per cent of the drivers involved in accidents had sufficient alcohol in their body to have a bearing on the accidents.

The point I am making is that if official statistics only reflect the kind of investigative work that is done, and the investigative work on this aspect of things is far from complete, to get the proper relationships here one must go to the studies that are done, the actual surveys, where you find the alcohol question in very high relief indeed.

It depends too on the type of accident that you are studying. For example, one study in Westchester county in New York state revealed that of the drivers involved in single vehicle accidents who were killed, 83 per cent of them had .05 per cent alcohol or more in their system. Recent studies from California and some other places where they have had a complete survey of those killed in traffic accidents and where they have done the blood alcohol levels in all of the drivers killed, show upwards of 50 per cent who have .1 per cent or more alcohol in their blood. So these specific studies where they have reviewed all of the data show a substantially higher proportion of drivers who have been driving at these levels associated with impairment than do the official statistics. I think in this respect official statistics are just lacking in complete data.

Mr. TOLMIE: What you are saying, in effect, is that the percentage is higher than is perhaps reflected in the evidence given by the defence counsel because this was just evidence he obtained from the Attorney General's department without seeing the actual drinking and driving. But as I say, the percentage shown was so small, and even the percentage you mention was so small, that it surprised me. This, of course, does not mean that we have to stop this particular attack, because it is just one attack of many attacks, but I think it was very revealing and it might be of interest if a concentrated study could be made in the same connection to show exactly what percentage of accidents are caused by drivers who drink, because if this impression is allowed to gain acceptance that, after all if it was as bad as people made it out to be, then our work and your work in connection with the breathalyzer test is going to be in jeopardy.

Mr. SMITH: It is much more difficult. The only data that I have now, with reference to Ontario, is that out of the approximately 1100 traffic deaths, we had levels of .1 per cent or more in, I think it was, about 230 of them in our laboratory alone on the deceased drivers. We are not getting all of the blood alcohol levels in our laboratory. Some of these are done in the laboratories of the regional pathologists and others around the province. I do not really have an estimate of what proportion of the total deceased drivers we are getting in our own laboratory, but whatever that proportion is we have this kind of data which indicated we have these findings on what must be about 20 per cent of the total. How many more there are, I do not know.

Mr. TOLMIE: I have just one more short question. We hear so many conflicting reports about the accuracy of the breathalyzer test that I think sometimes we become involved in an argument as to its efficiency. Assume for a moment that we do introduce it and make it compulsory, in what way will this help to decrease the number of accidents because of drinking drivers. In other words, what deterrent effect has it? It is not quite clear to me as yet how having a scientific test is going to prevent people from drinking and driving and getting into accidents?

Mr. SMITH: I think we have to look at what is happening in some other countries in this regard. I believe there are data in Sweden, where they have compulsory testing, on this point. There it is blood testing, but it does not matter. Their accident rates have stayed down over the years. It is difficult to relate this to our conditions because there are so many other factors involved. It seemed to me, however, that if this would apply in a very definite way to people then of necessity they would have to change their drinking and driving habits.

Mr. TOLMIE: You mean they would drink less because they would be afraid they might have to take a test.

Mr. SMITH: I do not think that necessarily they would drink less but they would make a choice before they went to the party as to who would do the driving on the way home, or make other arrangements.

Mr. TOLMIE: Because they might have to take an automatic test and lose their driving privileges.

Mr. SMITH: We get quite an effect in this way around Christmas time in Metropolitan Toronto, where they have spot checks. The actual rate goes away down during the period the spot checks are publicized.

Mr. MATHER: May I ask a related question on this point. Is it not true that in the province of Ontario, where we have had the breathalyzer test for some years on a permissive basis, that there is an increased percentage in the number of suspected impaired drivers who refuse to take the breathalyzer test realizing that they do not have to do so, and that if we had a compulsory breathalyzer test, that type of sophisticated drinking driver, which represents I think the hard core of drinking drivers, would be affected by being aware of the fact that they would face a mandatory test where they do not now, and therefore they would probably drink less or drive less when they are drinking?

Mr. SMITH: Yes, the percentage of refusals to take the test has increased from approximately 7 per cent in the year in which we first introduced it, 1958, to approximately 25 per cent. It was 26 per cent last year. I did one study on those who refused in Metropolitan Toronto, and many of those who refused are second and third offenders. These, as you say, are the hard core of the problem that we really want to deal with.

Mr. AIKEN: Mr. Chairman, I have a question along the same lines. Do you know of any test that has been conducted or survey made to determine the number of people who drive when drinking completely outside of the question of accidents.

Mr. SMITH: Yes, there are two studies that bear on this point. One was in Toronto in 1952, in which the drivers involved in accidents were compared with drivers passing the same corner not involved in accidents and the alcohol levels in them. In the drivers not involved in accidents the percentage of alcohol, in proportion to those who were drinking, was reasonably low. Another was the Grand Rapids study, which was done on the same date, and ordinary drivers compared to those involved in accidents indicated about the same proportion. I am trying to find what that was. That was those involved in accidents, but the question was what percentage of the drivers driving had alcohol in their system?

Mr. PHILIP FARMER (*Secretary-General, Canadian Highway Safety Council*): I am sorry for speaking up, Mr. Chairman, but I just wondered if this Committee has studied the Grand Rapids survey? These figures are available in this survey. The Canadian Highway Safety Council could make them available to this Committee, if it is desired. They showed something like 20 per cent of all people and drivers involved in accidents had been drinking. Perhaps that was not your specific question.

The CHAIRMAN: If copies could be supplied of this information we could make it an Appendix to the proceedings in your hearing on Thursday.

Mr. FARMER: I am sorry that I must answer your question this way.

Mr. SMITH: Both these studies show a higher proportion of drivers having alcohol were involved in accidents and this varied with alcohol levels. For example, there were twice as many drivers who had .06 in their blood involved in accidents as were present in the non-accident group. There were 67 times the number in the accident group who had .1 per cent alcohol as were present in the non-accident group—this was the Grand Rapids study—and there were 25 times as many in the accident group who had .15 per cent alcohol as were in the non-accident group. This was generally the direction of things in the Toronto study, showing that, depending on the alcohol level there, there was a tendency to select more accidents as the alcohol level increases. These figures give sort of the relative hazards of driving with various concentrations. I am sorry that is the only way I could answer your question.

Mr. AIKEN: I think you have answered my question. The point that I am trying to determine is this. Suppose a survey was made about the number of persons involved in accidents who wore eye glasses; it might show up to be 50 per cent. If you took the average population you might also find the same result, that 50 per cent of fatigued drivers wore eye glasses, and that would be no proof or indication that people wearing eye glasses were more prone to accidents than applying this method to the question of drinking drivers. If there is a large percentage of drinking drivers on the highway, then perhaps the figures showing that a lot of them are in accidents would not give a fair result. This was the reason for my question.

Mr. SMITH: There was a study that I did in 1950, which is still quoted on this point, which shows a relationship between the incidence of driving errors and blood alcohol level. In other words, as the alcohol level increases the proportion of drivers making errors which subsequently involve them in accidents increases; this can be plotted against alcohol levels, and these studies show that alcohol becomes an important factor in the accident at the level of .03 to .05 per cent. This is a study of accidents occurring as they do in real life—these people are not under tests as they drive—and pinpointing those levels of concentration as meaningful with respect to safety as far as alcohol is concerned. So that when you have this relationship then, an increasing relationship as the concentration goes up, it is like any other measurement as it were on cause and effect in the action of a drug, and strangely enough the relationship found here in these traffic studies follows the same pattern one would expect from drug studies—for example, the lowering of blood sugar with a dose of insulin.

Mr. AIKEN: I myself have no reasonable doubt at all but it is one matter that is occasionally raised and I am glad to have something on the record.

There was one other matter that I am a little vague about. You listed four suggestions for amendments to the bill. I rather took it that these came from Dr. Rabinowitch. Was I right in that assumption?

Mr. SMITH: Yes. When he returned on his way through Toronto after appearing before this Committee, he phoned me and mentioned these four points. I think I had made these four points also in my initial appearance before

the Committee, that we are really not dealing with venous blood when we are dealing with the breathalyzer; we are dealing with arterial blood and that two tests are necessary. If it is spelled out "a test", then you lay the basis for the possibility of error. Any measurement that is done needs to be verified; in the verification you remove the remote possibility of effect due to regurgitation, and allow for conformation of the readings through blood and urine as well as through breath. I think I had made the point on the urine test—I do not know what time limits are going to go into this suggestion of the Committee—that with a urine sample we can obtain information as to whether the alcohol level was increasing or decreasing in the period prior to the taking of the breath test; this gives valuable information because we are really concerned I suppose with what happened at the time of arrest rather than at the time of testing. Depending upon the wording of the bill that you finalize, this may well be important. It may be something that needs to be dealt with in the investigative stages rather than being dealt with in terms of hypothetical questions in court.

Mr. AIKEN: Then there is the last one, the deletion of the term "impairment", I believe.

Mr. SMITH: Well here, as you know, he takes the view that biological variation being what it is you cannot say "impairment" in all individuals. But I think the technical data is such that the chances for a person not being impaired at .08 are so small that you need not consider them. I think that is as far as any scientist can really go.

Mr. AIKEN: Then you would say, in effect, that you and Dr. Rabinowitch agree at least on these four essentials in the bill?

Mr. SMITH: Many discussions have been resolved in this way.

Mr. RYAN: Would you prefer a word such as "affected" to "impaired"?

Mr. SMITH: Well, my answer to this is not really on scientific grounds. I feel that scientifically one can say that at .08 per cent drivers are impaired. But I have seen so much of the contest which goes on in court when you label a man impaired—it is as though you were challenging his manhood—that if you take out this element of the offence then you put it in the same light as any other regulation where he and his person are being challenged. But this is something that he must abide by, and I feel that we are more likely to get compliance with the law if you avoid such terms.

Mr. RYAN: Even the term "affected".

Mr. SMITH: "Affected" is softening it. It would be preferable in this sense to "impaired" if one must use a term.

Mr. MATHER: Well, Mr. Chairman, my Bill, No. C-87, which is before us, calls for an amendment to the Criminal Code to provide for a mandatory test for impaired driving on the basis of .08 per cent of alcohol in the blood as determined by the use of the breathalyzer machine. The bill states that the presence of that amount of alcohol would become conclusive evidence of impairment. Just before I ask my question let me say that when Dr. Ward Smith and Professor Rabinowitch agree on the points that have been indicated, as a layman in drafting this bill, I am quite prepared to agree on those points also.

In relation to the last point of impairment, we had a delegation representing the Canadian Bar Association before us not long ago, and they had a resolution which also favoured the establishment of a mandatory test and the .08 per cent. But they said whereas my bill calls for that level of alcohol in the blood being taken as conclusive evidence of impairment, they, instead of that, would prefer that .08 per cent be established at a level which, at that level or above it, it would be against the law to drive. I then indicated, and I do now, that I would be quite happy to accept their proposal rather than my own in the subject matter of this bill. Would you not think that perhaps a better basis for determining impairment would be by simply stating that a person who has .08 per cent alcohol in his blood is not necessarily impaired but he is driving against the law when he has that percentage.

Mr. SMITH: Yes, I would certainly agree.

Mr. MATHER: I would agree with that too. As I said, I agree with the points that you and the Professor have apparently discussed and come to agreement on also.

Mr. RYAN: I take it, Dr. Smith, that this bill should specifically state arterial blood in place of venous blood.

Mr. SMITH: I think if you just say blood and not refer to arterial or venous. When you say breathalyzer it implies arterial blood.

Mr. RYAN: I do not see where it says breathalyzer in the bill.

Mr. SMITH: I mean breath tests.

Mr. RYAN: That is, section 223, clause 3, would read: "for the purposes of section 222, the blood level of alcohol shall be determined by an analysis of breath only"; it does not say how, though. Does it mean here breathalyzer?

Mr. SMITH: No, and I think this is wise too because while today we are using breathalizers as being the best instrumentation for the purpose, there are studies under way using other techniques—a gas chromatography, for example, which may offer all of the advantages and some additional ones to the breathalyzer. Besides the breathalyzer is a commercial instrument and it would be most unwise to specify a particular commercial instrument in any legislation. I am sure we would not want to put ourselves in that position. I know it is a difficult matter to deal with but it seems to me that if such a modification of the Criminal Code is introduced then we must be very careful about the kind of equipment that is used, the way that it is used, the standards of confidence of the operator that will use it and all of these other matters that are going to ensure close analytical controls.

When you make available to the accused a sample of the breath that has been tested, you in part do this, and when you make two tests mandatory, you in part do this, because of necessity in any measurement there are small variations and the operator of the test must be knowledgeable enough to deal with the kind of a variation that normally occurs. If he is consistently getting exactly the same answer then one knows that this is not a proper recording of things as they occur in real life. You have these two automatic controls on the whole conduct of the analyses. This may be as far as one can go federally. I assure you, however, that as far as we are concerned provincially, our controls go much further than this.

Mr. RYAN: You seem to have backed away from the term "arterial" blood as well as from the term "venous" blood.

Mr. SMITH: No, arterial blood would be fine.

Mr. RYAN: Is lung blood any better?

Mr. SMITH: "Arterial" would be fine, and this does express the relationship between breath and the kind of blood that we are dealing with.

Mr. RYAN: Maybe "arterial" should be modified in some way. I wonder if you would mind describing for us what happens when the venous blood goes back to the heart; from there through the lungs to the head.

Mr. SMITH: The venous blood comes back to the right side of the heart where it is pumped to the lungs; there it becomes arterial because it now picks up oxygen and gives off carbon dioxide and other waste products. It goes from there back to the more powerful side of the heart, the left side of the heart, where it is pumped out to the brain and all of the tissues. So you have the blood flowing through the lung which is just about to be delivered to the brain where the alcohol in that blood has its effect on the brain. It is in very close relationship, as close as one can possibly get—and this blood is in fact, arterial.

Mr. RYAN: I take it from what you are saying that very little if any impurity occurs in the arterial blood, even though it has to go back to the heart and be pumped up to the brain.

Mr. SMITH: There is very little change in it from the time it leaves the lung until the time it goes to the heart and to the brain.

Mr. RYAN: Would it be a change not worth worrying about?

Mr. SMITH: As a change it is inconsequential, in terms that we are thinking of here.

Mr. RYAN: So arterial blood, substantially, would be the way you spell it out.

Mr. SMITH: Yes.

Mr. RYAN: You told us they puncture the lower lobe of the ear in Sweden and take the blood from there?

Mr. SMITH: Yes.

Mr. RYAN: I suppose that would be sort of half arterial and somewhat venous, would it?

Mr. SMITH: Yes. You have a delivery system to the tissues, which is arterial, breaking up into smaller and smaller vessels which eventually become small enough to be called capillaries, and you get the distribution of alcohol from capillaries to tissues. Then you have the collecting mechanism at the other end of the capillary which join and become larger and larger vessels which become known as veins. So, as you say, the capillaries are midway between artery and vein and the correlation there between capillary blood and lung air is reasonably good. It is strange to think of the difficulties if you spell out arterial blood and then suggest that blood or urine samples could be used

for confirmation because one cannot obtain arterial blood samples—the procedure is much too painful. But the urine tests are an expression of arterial blood because it is the arteries that supply the kidney. This question of the confirmatory tests bothers me a bit. If you do spell out arterial blood then this would prevent the use of a blood test for confirmatory analysis. This may be the only way open to the accused to get his own sample under some conditions that exist in the hinterland of the country.

Mr. RYAN: I think in the legislation it could be spelled out on that exceptional basis in another paragraph or clause.

Mr. SMITH: Yes, it could.

Mr. RYAN: If there was sufficient doubt from a blood test then that test would be invalidated.

Mr. SMITH: That is right.

Mr. RYAN: What about the Swedish test? How many parts per thousand in the blood would be necessary to convict?

Mr. SMITH: In Sweden, at one level of the conviction, which represents a fine and a loss of licence for, I think, three months or so, the level is .05. For imprisonment and loss of licence for life or until they can show cause the level is .15. In Norway, they have the one level of .05, which they have had since 1923.

Mr. RYAN: Is that an ear test, too?

Mr. SMITH: This is taken on the ear prick blood. They take six samples, which all are sent to the central laboratory of the country. The samples are analyzed by two different methods, the results correlated, and whatever benefit in the analysis needs to be given to the accused is given to him there in terms of presenting the results of these analyses. It is very carefully controlled analyses throughout. We need to approach this careful control of analyses if we are going to do this sort of thing.

Mr. RYAN: I take it you feel the breathalyzer is a lot more practical?

Mr. SMITH: It is far more practical and, in my opinion, as it is used, and the way we use it in Ontario, and the controls that we place on its use, is far more accurate in the sense that nothing can go wrong with it, if one follows the prescribed method of operation. If something does go wrong, one will see it immediately. Unfortunately, I cannot say the same for blood tests as done through many of the laboratories in this country and in others. There are too many instances that have been brought to my attention where the results obtained by these methods do not agree with the amounts put in these samples. We have actually put certain amounts of alcohol in samples and sent them out to laboratories as blind tests and we got the answers back. In some cases, these are not very good. We have done this in Ontario and our results are within .01 per cent of what they should be, but it is not necessarily true in other jurisdictions.

Mr. WAHN: Dr. Smith, as I understand it, the breath tests imply the testing of arterial blood. You mentioned that it would not be practicable to take arterial blood for the purpose of a confirmatory blood test. Does that mean that you are taking venous blood for the purpose of blood tests?

Mr. SMITH: Yes, you would be.

Mr. WAHN: You are not testing the same things then?

Mr. SMITH: You are not really testing the same things.

Mr. WAHN: Then, is this a weakness in the confirmatory tests?

Mr. SMITH: You might say in a nit picking sense, yes, but in practical terms we are doing analyses on these people usually long after they have finished their drinking, usually long after the major portion of the alcohol has been absorbed, and under these conditions there is essential agreement between the alcohol and venous blood and in the breath or arterial blood. So it is not really a practical problem but one that in terminology is semantics, which one should be aware of.

Mr. WAHN: In what type of blood is the alcohol level likely to be higher, in the arterial blood or the venous blood, if you took these samples at the same time?

Mr. SMITH: Where there is a difference this will be in the early stages after taking alcohol, and the arterial blood under those circumstances can be higher, but it takes very rigorous drinking conditions to demonstrate the difference. In other words, one has to take a mickey of whiskey and have the tests done in about 15 minutes after he has finished the whiskey to demonstrate a difference.

Mr. WAHN: Where they take the blood from the ear in the Swedish test is this arterial blood or venous blood?

Mr. SMITH: Well, it is midway between the two; it tends to parallel the arterial blood rather than the venous blood.

Mr. WAHN: You mentioned that in order to obtain accuracy you must be careful with regard to the instruments used and also that the technicians must be skilled. Could you estimate with any degree of accuracy to what proportion of the Canadian population these instruments and skilled technicians are available at the present time?

Mr. SMITH: They are available to a limited extent in Nova Scotia and to larger extent in New Brunswick. I do not know the situation in Newfoundland; I think possibly it is non-existent. I do not know of an instrument being used in Quebec at the present time in practical work. The coverage is fairly complete in Ontario; we have 55 instruments and 350 trained operators. I believe there are a few instruments in Manitoba. The coverage in Saskatchewan is fairly complete. I think the coverage in Alberta is only in the Edmonton area, and coverage in the Vancouver area of British Columbia and it is extending throughout the province because of some recent legislation that they have. These facilities throughout the country could be extended very readily to take care of the problem. I feel we are quite ready for it in Ontario.

Mr. WAHN: Thank you, Mr. Chairman.

Mr. TOLMIE: I believe there is a large body of opinion which is opposed to the idea of police officers indiscriminately stopping a motorist and forcing the motorist to have a compulsory breathalyzer test. Do you think it would be preferable to have the test mandatory only as a result of an accident or perhaps for some traffic violation? In other words, should the policeman be allowed arbitrarily to apprehend any motorist and to force a breathalyzer test on him without more than perhaps a reasonable idea that he is impaired?

Mr. SMITH: I think this question will resolve itself in usage. I should think the overzealous officer who stops too many people without cause would find himself in great difficulty in time. It seems to me, however, that where there is something in the driving, an improper turn, or other infraction, and the smell of an alcoholic beverage on the breath, there are probably reasonable grounds to request a test, in addition to the fact that in other cases there may have been an accident. It seems to me that one great deterrent would be the properly scheduled spot checks that are occasionally done, not that these need be very widespread, but the fact that they can be done would have a tremendous deterrent effect.

Mr. TOLMIE: I think this is the crux of the whole matter. I believe if you had been drinking and had just left a party, just the fact that perhaps you might be stopped indiscriminately and be forced to take a test, would have a most severe deterrent effect.

Mr. SMITH: In answer to your question, I would not like to see a situation where spot checks would be eliminated. I would like to see the possibility of these for the deterrent value that they undoubtedly will have. I think as a society we can manage this somehow without undue interference with the average motorist.

The CHAIRMAN: What is the procedure followed by the Toronto Metropolitan police to prevent accidents around the festive season? A man may be driving his car and when he comes to a stop light a policeman puts his head in the window. You could probably tell us what happens from then on.

Mr. SMITH: As I understand it, they do set up locations at unspecified places around the city and stop the cars as they are going by with a very cursory check on brakes, lights, driver's licence and so on. In the course of this, they also have a watchful eye for any evidence of the effects of alcohol. In the course of this they find a number of people who are driving without a licence; perhaps a criminal is using the road; the number of charges for impaired driving increase, and when they are publicized in the daily paper, the accident rate goes down during these checks. There is a general check, including the possible effects of alcohol.

Mr. WAHN: I have one other question. Did Dr. Ward Smith not mention that in some cases blood tests do not agree with the actual facts. If so, this would tend to lessen the value again of the confirmatory blood test. I believe he said that in certain areas he had found that in practice the bloods tests were in error.

Mr. SMITH: There again, if blood tests or any other tests are used to confirm the breath tests, I would like to see the same kind of controls on the way in which that analysis was done and by whom. If these controls were exercised, then there will be essential agreement.

Mr. WAHN: I gather there is not the same problem with regard to urine tests.

Mr. SMITH: The same problem obtains with respect to the analysis of urine.

Mr. WAHN: Does it?

Mr. SMITH: Yes.

Mr. WAHN: It could be out just as much as the blood test?

Mr. SMITH: It depends upon the methods used and the person using the methods. This is what this chapter in "Forensic Science" is all about. I reviewed the various things that can occur in the analysis for alcohol both by using breath, blood and urine and outlined the various methods which have been shown to be acceptable through usage over a number of years and the controls that are necessary on these analyses if they are to be acceptable.

There is an analytical problem here. I know it is difficult to ensure federally this kind of control in the provinces. There are already discussions beginning as to how the various laboratory people across the country will meet this problem. I am sure this can be done by agreement with those concerned in the analytical programs of the provinces.

Mr. WAHN: But at the present time at any rate there can be errors in blood tests and in urine tests. Could there be errors also in breath tests, or is there something inherently more accurate in breath testing than there is in blood testing and urine testing?

Mr. SMITH: Any analysis is subject to inaccuracy if it is improperly controlled, but where you specify the controls it is possible to ensure accuracy. We have done this with our breath testing, our blood and urine testing in the province of Ontario.

Mr. WAHN: Is it easier in any one of these tests to obtain accuracy than in another?

Mr. SMITH: It is easier to obtain accuracy in a breath test than it is in a blood test or a urine test.

Mr. WAHN: From the theoretical considerations involved it is easier to ensure accuracy with the breath test?

Mr. SMITH: Than in either of the other two.

Mr. WAHN: Either of the other two.

Mr. SMITH: First, that the sample is injected directly into the instrument so you do not have the problem of contamination of the sample. Second, that the sample is uniform once you establish the conditions for taking the sample.

This is a minor point, but in taking a portion of a blood sample for analysis, one could have a different distribution of blood cells and food portions of the blood, which can affect the analysis to a small extent but, nevertheless, there is a variation there which is not present in the breath test.

Third, the instrument is calibrated so that the relationships in the instrument are already fixed, and as long as one employs a controlled analysis, where you have a definite amount of alcohol and water, and the air put through it into the instrument each time, it should read a certain reading—so you are checking your instrument with each analysis that is done, and this immediate check gives you tremendous stability with a breathalyzer. With our blood test work and urine test work we also employ these standards. We run these standards through with each set of analysis. As long as that sort of thing is done one should

see when anything has gone wrong in this. I believe that the breath test is capable of the greatest control and the least likelihood of error than even the blood test.

Mr. RYAN: Mr. Chairman, suppose three, four or five men were tested in the same evening by the one machine, would there be any possibility of one test affecting the other? How does this work?

Mr. SMITH: No. There is a stage in the analysis where any residue of the previous sample is flushed out of the machine before a second sample is put in. For example, in our procedure we first run a sample of room air to assure ourselves that there is no contamination anywhere in the instrument or in the ampoule that is used or any portion of the test, and the reading on it should be less than .005. Then we run a standard which, under the conditions we run it, should read 1.5 per cent. This is a check on the entire workings of the instrument, discalibration incidentally, the reactivity of the material in the ampoule, so that all of this is behaving properly. Then there is a flushing of the instrument with room air; then the sample of the breath of the accused is put through it, flushing and then a second sample of the accused's breath, all using the same ampoule. There is no carry over from the standard to the sample of the accused's breath. So that is all taken care of with each analysis that is run.

Mr. RYAN: Is there any setting on the machine that applies specifically to the person being tested?

Mr. SMITH: Yes. We use a mouth piece, a little plastic tube that is attached to the tube entering the instrument, and a fresh one of these is given to each person. These can be cleaned in a solution that would remove any bacteria, contamination and so forth, then dried and a fresh one used for each person. There is no contamination of bacteria, for example, from one person to the next.

Mr. RYAN: A person breathing into a machine or this type of thing would be a lot more scientific and accurate than somebody breathing into a policeman's face to determine impairment?

Mr. SMITH: Oh, yes.

The CHAIRMAN: If there are no further questions, thank you very much indeed, Dr. Smith; you were most generous with your time. We appreciate it very much.

Is it agreed that "Methods of Forensic Science", Volume 4, by H. Ward Smith, the Attorney General's Laboratory, Toronto, Canada, and particularly the passages therein marked by Dr. Smith be an exhibit.

Some hon. MEMBERS: Agreed.

Mr. AIKEN: Mr. Chairman, does this mean that the whole document will be reproduced?

The CHAIRMAN: No. It simply will be an exhibit. It will be here available or anybody to read but it will not be printed in the proceedings.

Mr. AIKEN: This is why I raised the question. If it is made an appendix, it will have to be printed in full.

The CHAIRMAN: We will make it an exhibit. If there is no further business the meeting stands adjourned. We will meet on Thursday at eleven o'clock when our friend, Mr. Farmer, will be here as a witness, together with others, I take it.

Mr. FARMER: I will be alone, sir.

The CHAIRMAN: The meeting is adjourned.

**OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE**

This edition contains the English deliberations
and/or a translation into English of the French.

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 18

THURSDAY, NOVEMBER 24, 1966

Respecting the subject-matter of

Bill C-26, An Act to Amend the Criminal Code (Safety
Devices for Automotive Vehicles)

Bill C-49, An Act to Amend the Criminal Code (Dangerous
Motor Vehicles)

Notices of Motion Nos. 26, 31, and 38

and

Bill C-87, An Act to Amend the Criminal Code (Impaired Driving)

WITNESSES:

From the Canadian Highway Safety Council: Mr. Philip J. Farmer,
Executive Director; and Mr. Yves Mondoux, Assistant Director of
Public Relations.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1966

UNIVERSITY OF OTTAWA

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron (*High Park*)

Vice-Chairman: Mr. Yves Forest
and Messrs.

Addison,*
Aiken,
Choquette,
Fulton,
Goyer,
Grafftey,
Guay,
Honey,

Laflamme,
Latulippe,
MacEwan,
Mather,
McCleave,
McQuaid,
Nielsen,

Otto,
Ryan,
Scott (*Danforth*),
Tolmie,
Trudeau,
Wahn,
Woolliams—24.

(Quorum 10)

*Replaced Mr. Chrétien, Wednesday, November 23, 1966.

Timothy D. Ray,
Clerk of the Committee.

ORDER OF REFERENCE.

WEDNESDAY, November 23, 1966.

Ordered,—That the name of Mr. Addison be substituted for that of Mr. Chrétien on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House of Commons.

MINUTES OF PROCEEDINGS

THURSDAY, November 24, 1966.
(22)

The Standing Committee on Justice and Legal Affairs met this day at 11.25 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Addison, Cameron (*High Park*), Choquette, Guay, Honey, Latulippe, Mather, McCleave, Ryan, Tolmie (10).

In attendance: From the Canadian Highway Safety Council: Mr. Philip J. Farmer, Executive Director; and Mr. Yves Mondoux, Assistant Director of Public Relations.

The Chairman introduced Mr. Farmer and Mr. Mondoux. Mr. Farmer read a brief on behalf of the Canadian Highway Safety Council re Bills C-26, C-49. Following this he made some comments on previous evidence given before the Committee.

Mr. McCleave raised a question of privilege relating to Mr. Farmer's comments on evidence given by Mr. Heward Grafftey, M.P.

Mr. Farmer then made some comments on Bill C-87.

*Agreed,—*That a prepared statement by the Canadian Highway Safety Council entitled *Bill C-87, Alcohol and Traffic Safety* be appended to today's proceedings (*See Appendix 11*).

Mr. Farmer read a reprinted article entitled *Alcoholism and Traffic Fatalities: Study in Futility* by Melvin L. Selzer and Sue Weiss from the *American Journal of Psychiatry*, Vol. 122, No. 7, January, 1966.

Following comments by Mr. Farmer on previous evidence by Mr. Bazos,

*Agreed,—*That a letter from Mr. C. E. Laybourn, Director of Traffic Safety, Ontario Department of Transport be made an exhibit (*See Exhibit 15*).

*Agreed,—*That *Fatal Motor Vehicle Traffic Accidents on the King's Highway only, May—1966* by the Planning Branch, Traffic and Planning Studies Section, Ontario Department of Highways be made an exhibit (*See Exhibit 16*).

After questioning by the Committee, Mr. Cameron thanked Messrs. Farmer and Mondoux for their excellent brief and other material they had provided the Committee with.

At 1.10 p.m. the meeting adjourned to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

THURSDAY, November 24, 1966

The CHAIRMAN: I am going to suggest that we ask Mr. Farmer of the Canadian Highway Safety Council and Mr. Mondoux who is here with him, to proceed with their presentations. After you have concluded the members will ask you questions.

Mr. PHILIP J. FARMER (*Executive Director, Canadian Highway Safety Council*): Thank you Mr. Chairman. With your permission, we will go ahead with our formal brief as it relates particularly to Bills No. C-26 and C-49. I would like also Mr. Chairman, to make some comment on previous evidence that has been presented to this committee on these two bills. Also if time permits, I would like to submit some supporting evidence on Bill No. C-87, particularly in view of the testimony given on Tuesday last by Dr. H. Ward Smith.

Mr. Chairman and gentlemen, the Canadian Highway Safety Council is grateful for the opportunity of appearing before this committee today.

The Canadian Highway Safety Council is the national co-ordinating body in highway safety.

The Council was formed in 1955 in Ottawa following a national conference attended by more than 400 prominent Canadian citizens interested in what promised to be the country's major problem, traffic accidents. The first General Chairman of the Council was the Honourable Brooke Claxton.

The Council groups together and enjoys the full co-operation of the federal, provincial and local governments, business, industry, labour, provincial safety councils, associations and social groups that otherwise would have no common meeting ground in the field of safety.

The Council is represented on the committee of the Canadian Government Specifications Board currently drafting automobile safety standards. At the request of the Board the Council has written two draft sections of the Code.

The Council is also a member of the Canadian Standards Association committees on automobile tires, seat belts, safety helmets for motorcyclists, lighting or commercial vehicles, directional signals for motor transport and advance warning devices. The Council chairs two of the committees.

Coming straight to the point, the Council wishes to go on record as favouring and supporting the establishment of minimum safety performance standards for all automobiles manufactured and/or imported for sale in Canada. With regard to the need for specific safety devices in cars, for the optimum safety of occupants, Council records show resolutions and recommendations dating back as far as 1956 on such matters as disc brakes, emergency brake performance, win braking systems, banning of illegal braking fluids, seat belts, combined lap and shoulder belts, safety door locks, lights, windshield washers, tires, car trailer latches and car safety standards generally.

The Council feels that, for the sake of uniformity, efficiency and economics, these safety standards should be North American in scope.

Ideally these standards should be mandatory to eliminate the competitive aspect inherent in the voluntary inclusion of safety devices in cars. The constitutionality involved is, of course, a matter for the legal authorities.

Further, to avoid unnecessary duplication in automotive research, which is costly, the council feels that the development of standards should be a co-operative effort between governments, industry and independent research groups.

In this connection I quote Dr. William Haddon, Jr., recently appointed by President Johnson, Administrator of the new Traffic Safety Agency set up by the United States government to implement the new Traffic Safety Act and who, by the way, already has been suggested among the experts to appear before this committee. Dr. Haddon said:

Issuing requirements for the auto industry to meet is not so simple. This will require the development, first, of performance tests, and, second, the reaching of a consensus as to the levels of performance which vehicles should meet.

I do not feel that our job is to do things in Washington or to control things from Washington any more than is necessary to see that the basic mission is accomplished.

As far as the industry is concerned, this means that we will be pushing for it to do its job, just as we will be pushing everyone else to do theirs. We will be successful to the extent to which others run with the ball.

It is obvious that close co-operation between governments, industry and separate research groups will be necessary.

In the event that a decision is made to cover automobile safety in the Criminal Code, the Council offers the following comments on Bills C-49 and C-26 being considered by this committee.

Bill C-49

1. This Bill should not be tied to section 221 of the Criminal Code, which deals with offences relating to the operation of a motor vehicle, inasmuch as the proposed subsection (5) is in no way related to the existing offences under that section.

2. Section 492 of the Criminal Code requires that a person charged with a criminal offence must be provided with sufficient detail of the circumstances of the alleged offence to give the accused reasonable opportunity to know with what he has been charged. The wording of subsection (5) is so general it seems to be in conflict with section 492.

3. It would be impossible to prosecute unless the bill was clarified to spell out what is intended as a minimum of safety for automobile construction so that comparison is possible to show a definite non-compliance beyond a reasonable doubt.

Bill C-26

1. This Bill should not be linked to section 226 of the Criminal Code which deals with offences relating to the ownership, or care, charge or control of a motor vehicle or vessel.

2. If the Bill is intended to cover motor vehicles manufactured in Canada, in the interest of public safety, it also should cover motor vehicles imported into Canada.

3. All but two of the safety devices listed will be standard equipment items in 1968 model automobiles manufactured in Canada. These safety devices are covered by the Canadian Government Specifications Board's Automotive Vehicle Safety Code.

4. Without specific minimum performance standards for safety devices, it would be difficult to assure public safety and difficult to show a definite non-compliance beyond a reasonable doubt.

There is no simple solution to Canada's highway accident problem. From 85 to 90 percent of traffic accidents result from driver errors. Statistics show that some of the more common errors are: Failing to yield the right-of-way; speed too fast for conditions; driving on the wrong side of the road; failing to stop at a through street; inattentive driving; cutting in; improper passing; improper turns; improper parking.

Approximately 29 percent of at-fault drivers in fatal accidents have previous accident or conviction records.

As the committee is aware, the Council supports Bill C-87 since alcohol is an important factor in traffic accidents.

To obtain optimum results the traffic accident problem must be attacked with a balanced program in four major areas: research; engineering; laws and enforcement; education and Public Information.

There are three phases to a traffic accident:

1. *The initiation phase*—Accident prevention is of the utmost importance at this time. This involves a myriad of factors evolving from the driver, the pedestrian, the vehicle and the highway.

2. *The brief interval of the crash*—Injuries depend on how well the impact forces have been anticipated by the designers of the vehicle and the highway.

3. *The clean-up phase*, This is a highly neglected field—Slow or inadequate emergency care of the injured can mean completely unnecessary death or disability and prolonged medical care.

A great deal has been said about blame for the lack of positive action on traffic safety.

In the New Testament John quotes Christ as having said, "He that is without sin among you, let him first cast the stone at her."

Using hindsight we all should have done more. By "we" I mean: safety councils; members of Parliament; automobile manufacturers; the medical profession; the legal profession. In fact, all Canadians must take some of the responsibility.

The point has been made that we need safer cars. The time has come to stop throwing stones and ask ourselves what can we do about it now, and what can we do in the future.

The overall problem of improving the crash worthiness of automobiles is sufficiently complex that various aspects have been isolated for concentrated study. These studies include:

1. Controlled collisions of actual automobiles to define the actual acceleration environment within the passenger compartment. However, the development

of human tolerance data, improved interiors and restraint systems by this means alone is not feasible.

2. Human responses and tolerance limits for the type of impact forces and accelerations that occur in automobile collisions are being investigated with cadavers and anthropomorphic dummies in a variety of sled tests.

The recent Stapp Car Crash Conference showed that these research studies which are now being carried out are extremely difficult and complex. They are complicated by the very necessity to use dummies and cadavers rather than live humans, and by system nonlinearities which preclude extrapolations and becloud interpretations of the test results.

Work is being done now to engineer computer programs to design automobile interiors and restraint systems. These programs can be only of limited use until the engineering and biomedical research programs mentioned above have been completed. The day is not too far distant when computer implemented designs of automobile interiors can be rated for safety before manufacture commences.

But that is still in the future! What can we do now?

Last year in Canada, 4,879 died in highway accidents, 148,814 were injured and there were 395,000 reported accidents.

Car safety devices will reduce the number and severity of injuries. However, they will not appreciably reduce the total number of accidents.

Statistics show that 27 per cent of those killed were pedestrians, and 73 per cent of the deaths were due to vehicle crashes.

The leading causes of fatal injuries sustained in the "second crash" were listed in two well known studies. By order of importance they were shown as: Cornell study—

- (1) ejection,
- (2) steering assembly,
- (3) instrument panel,
- (4) windshield,
- (5) door structures,
- (6) front corner post,
- (7) roof.

University of Michigan study—

- (1) ejection,
- (2) front door,

Most safety experts agree that without the use of seat belts or the combination of seat belt and torso restraint many of the other automobile safety features will have limited effect.

A recent study in depth of 139 fatal accidents involving 177 deaths indicated the following possible survivability if the passenger had been using restraints: seat belt only 40 per cent; seat belt and shoulder belt, plus 13 per cent (or total

of 53 per cent); seat belt and double shoulder belt, plus 7 per cent (for a total of 60 per cent). It is indicated that 37 per cent would not have been saved, and 3 per cent were unknown.

While recognizing that these figures apply to a particular series of accidents, whether or not they represent the national average, we can translate the data into Canadian statistics after first deducting the pedestrian deaths. It is possible that the following lives might have been saved on Canadian highways in 1965 if restraints had been worn by drivers and passengers.

	Approximate Reduction in Death	
Use of seat belt only	29.2%	or 1,420 people
Use of seat and shoulder belt	plus 9.5%	plus 460 people
Use of seat and double shoulder belt	plus 5.1%	plus 250 people

There can be no question that the use of seat belt and torso restraints will make a significant reduction in the number and severity of injuries.

The introduction of the energy-absorbing steering column in 1967 and 1968 model cars will undoubtedly further reduce the number and severity of injuries. Of interest is the recent crash of a 1967 model car equipped with an energy-absorbing steering column. The car travelling at approximately 60 mph crashed into a stationary tractor trailer. The driver wearing a lap belt only, escaped with facial lacerations from flying glass and bruises to his chest and hips. While it is too early to report a major success, the result of this one incident is encouraging.

The new safety glass installed in 1966 model cars is also producing an encouraging reduction in injuries.

It also must be borne in mind that if all known safety devices were installed in new model cars to-day, it would take about 12 years to replace cars now on the highway.

Of major concern, is the fact that while seat belts were first included as standard equipment in 1964 model cars, only 30 per cent of Canadian cars are presently so equipped.

The fact that seat belts and torso restraint systems are installed in automobiles means little unless they are worn. It is estimated that seat belts are worn regularly by approximately 11 per cent of Canadian drivers and passengers. A recent survey of 566 automobile accident hospital cases revealed that while seat belts were available to 24 per cent, only 3 per cent of the victims were using the seat belt at the time of the accident. This is an actual Canadian survey.

Unfortunately there is no pill that we can take to give us instant safety. It is obvious that all phases of the accident problem—car safety design, accident prevention and emergency care—must be attacked with equal vigour.

To achieve the optimum result in highway safety is a large and difficult task. However, we know that accidents can be prevented and injuries reduced. To reach our goal will require the co-operation, dedication, energy and resources of governments, business and industry, the legal and medical professions, safety councils and all interested agencies.

It means all-out war on accidents. All Canadians must be involved.

Gentlemen, this was the formal presentation of the Canadian Highway Safety Council on Bills No. C-26 and C-49. With your permission, while we are still speaking on these two bills, the Council would like to take this opportunity to comment on certain testimony previously presented to this committee.

The CHAIRMAN: It is quite in order.

Mr. FARMER: Thank you Mr. Chairman. Proceedings and evidence No. 10 was a presentation by the Canadian Automobile Association. The Canadian Automobile Association posed the creation of a consultative council on highway safety. The Canadian Highway Safety Council submits that this would be a duplication of the functions of the council. The council is the national co-ordinating body in highway safety. It is a bilingual, non-profit, non-partisan, public service organization, supported by the federal government, provincial governments, business, industry, labour, national associations, provincial safety councils, service and social groups interested in highway safety.

The council has tabled with this committee copies of a report covering its varied activities. This is a report that will be available to the committee. The report will show that the formation of a consultative council on highway safety would duplicate the work done by the Canadian Highway Safety Council and fragment the safety effort. Naturally, I might add, that we welcome government support, particularly in the field of safety research.

Proceedings and evidence No. 4 was a presentation by Mr. Heward Grafftey. On page 81 the witness states, and I quote:

...I say, that the highway safety councils and the safety leagues have done a good job in terms of trying to advocate the building of better roads; they have done a good job in terms of cajoling the driver not to be a 'nut behind the wheel', but why do they refuse to discuss the building of safer automobiles?

The Canadian Highway Safety Council has made resolutions and recommendations on car safety devices dating as far back as 1956. These resolutions and recommendations have been supplemented by the presentation of papers, public information releases and campaigns. These facts are on record for all to see.

On page 81 again, the witness says, in effect, that the Canadian Highway Safety Council accepts silencing money, and in return refuses to talk about car safety. He also indicates that the council is the main reason that very little legislation has been passed by parliament.

This is a completely irresponsible statement which does grave harm to the safety movement. It is an insult to the thousands of all your workers who dedicate their time, money and energy to accident prevention. The council's position on car safety is clear, and it is on record. If this committee is interested, the council will receive 9.4 per cent of its 1966 budget from the motor vehicle manufacturers. The council will also receive 18.8 per cent of its budget from the federal government in 1966. Presumably the witness might also consider this hush money. The official policy of the Canadian Highway Safety Council is set by its executive committee. The executive committee members, 60 in number, receive no remuneration or expenses from the council; their services are voluntary. The committee is made up of representatives from the federal government, all provincial governments, business, industry, labour, national associations, provincial safety councils and service organizations. There are many prominent Canadian men and women serving the council. To suggest that the council is receiving bribes and is obstructing Parliament is a completely irresponsible statement.

We feel that Mr. Grafftey should either supply evidence to your committee or withdraw his statements.

On page 88 the witness states:

In the Canadian Highway Safety Council last week in Calgary—renowned government experts addressed the Council on the building of safer roads and renowned government experts addressed the council on the policing of drivers and on the educating of better drivers. Who addressed the Safety Council on the building of cars, or on the annual inspection of cars? Executives from the automobile industry. Where else, in modern society, would we let such a farce continue?

For the record, Mr. Chairman, Mr. Grafftey was invited to attend the Calgary conference but declined. This was unfortunate since it would have provided him with an excellent opportunity to contact the grass roots, the individuals and associations interested in safer cars, safer roads, safer drivers and to find out first hand what is being done. To set the record straight, the council always has endeavoured to have speakers and panelists, persons who are the most qualified on the particular subject being considered. The Calgary conference was no exception. On the subject of automobile safety the council endeavoured to obtain speakers knowledgeable on the subjects on which they were requested to speak. These speakers included Mr. S. E. Swallow, Director of Service with the Ford Motor Company of Canada and chairman of the council's motor vehicle safety committee; Mr. W. A. Woodcock, chief engineer of General Motors of Canada and chairman of the council's automotive engineering committee; Mr. R. B. Armstrong, assistant chief engineer, Body Components and Developments, Chrysler Corporation, Detroit, Michigan; M. J. Widman, Ford Research and Engineering Centre, Dearborn, Michigan; Mr. R. McMillen, director of Tire Development, Goodyear Tire and Rubber Co., and Mr. P. S. Meyer, General Motors Engineering staff, Warren, Michigan.

On the subject of alcohol and road traffic and the subject after the violation, the council had as speakers, His Hon. S. V. Legg, judge of the district court of Northern Alberta; Dean W. F. Bowker, Q.C. Dean of the faculty of law university of Alberta; Professor J. D. Taylor, assistant professor of Pharmacology, University of Alberta; Dr. H. Ward Smith, director of the Attorney General's Laboratory, Ontario; Magistrate R. V. Read, City of Calgary, and Mr. R. M. Anthony, Chief Crown Prosecutor, Department of the Attorney General, Alberta. Dean Bowker, Dr. Ward Smith and Mr. Anthony already have been witnesses for this committee.

Similarly, on the subject of roads the council had such experts as Monsieur Jacques Verreault, Deputy Minister of Transportation and Communications, Quebec; Mr. D. E. Campbell, Traffic Engineer, City of Calgary; Mr. B. M. Huffman, Traffic Engineer, City of Edmonton and president of the Edmonton Safety Council, and Mr. D. D. Kuchinski, Traffic Planning Engineer, Department of Highways, Alberta.

On the subject of education the council was fortunate to have such experts as Dr. R. E. Rees, Director of Special Services, Department of Education, Alberta; Dr. E. J. M. Church, Assistant Director of Curriculum, Department of Education, Alberta; Mr. Robert Warren, Superintendent of Schools, Calgary; Dr. J. W. Woodsworth, Head of the division of Educational Psychology, University of Calgary, and Dr. James Malfetti, Chairman of the Department of Health Education, Columbia University.

It is indeed unfortunate when the work of so many dedicated safety people can be undermined by incorrect statements.

I would like also Mr. Chairman to correct some statements in the Minutes of Proceedings and Evidence No. 4. At page 79 the witness stated that one million were injured in 1965, two-thirds permanently disabled. The correct figure should read 148,814 injured in highway accidents, one-third permanently disabled.

On page 80 it was stated:

...if the federal government orders the automobile industry to put into the automobile at the production stage already known scientifically proven safety features, we could immediately reduce this toll in accidents and injuries...

Corrected, this should be "known car safety devices will not appreciably reduce the number of traffic accidents". On the basis of normal production it would take 12 years to replace automobiles now on the road. There will be no dramatic overnight reduction in injuries if a law is passed.

On page 88 it was stated that 87 per cent of the death and injury producing accidents took place under 45 miles an hour. The correct statement should have been 87 per cent of traffic accidents and 45 per cent of traffic fatalities occur at speeds under 40 miles per hour.

The CHAIRMAN: Have you something you want to say, Mr. McCleave?

Mr. McCLEAVE: I just want to raise a question of privilege. I do not know if the witness advised Mr. Grafftey that he was going to quarrel with some of the statements that Mr. Grafftey apparently had made previously. I was not at that meeting so I do not know the merits of this particular issue at all. I did phone Mr. Grafftey's office so that he would at least have notice. I think he is in the position many of us are in; he is on two or three committees that are all meeting at the same time.

I would like to ask the witness whether Mr. Grafftey had been given notice as to what was going to be said here this morning.

Mr. FARMER: No sir, he was not. I did not know that this was advisable.

The CHAIRMAN: I did not know either, Mr. McCleave.

Mr. McCLEAVE: No. I realize that, Mr. Chairman.

The CHAIRMAN: On the question of privilege, I would think that a full copy of what has been said will be in Mr. Grafftey's hands, and he will have a proper opportunity of replying to it.

Mr. McCLEAVE: In fairness to the witness, he would know about the multiplicity of simultaneous committee meetings. This is a problem that bedevils us.

An hon. MEMBER: Mr. Grafftey is a member of this committee.

The CHAIRMAN: Yes, and he was at several meetings.

Mr. FARMER: Mr. Chairman, I did not realize that he was a member of the committee. I must say, looking back on the previous proceedings, that this is an error on my part.

The CHAIRMAN: I do not think that any harm has been done.

Mr. FARMER: I would certainly like Mr. Grafftey to see this, and I would be very happy to talk to him about it. We did, Mr. Chairman and gentlemen, wish to take this opportunity to correct certain statements that were made, and I appreciate your hearing us out on that.

This, Mr. Chairman, concludes the evidence that we wished to submit on the two bills we were talking about. We have some further evidence that we would like to submit to the committee on Bill No. C-87, if this is the time to do it.

The CHAIRMAN: Yes, this is the time. Have you copies of that statement you made?

Mr. FARMER: Yes. I think this would be advisable, Mr. Chairman, to distribute some of this information.

Just as a preamble, at the hearings on Tuesday when Dr. H. Ward Smith was testifying, some committee members wanted to know if there were some statistics available on the alcohol problem in so far as it related to traffic accidents. I promised that we would endeavour to bring some further evidence before this committee, which I am glad to do today. I regret, Mr. Chairman, that we do not have this evidence in the French language because I did this in rather a hurry yesterday. I apologise to the committee members for not having this available.

The CHAIRMAN: You are just going to make some comments on this?

Mr. FARMER: Yes.

The CHAIRMAN: Perhaps you could undertake to give us a copy in French, and if the committee agrees, then both can be made an exhibit to today's proceedings.

Mr. FARMER: Thank you very much.

The CHAIRMAN: Or they can be made an appendix, if the committee so decides.

Mr. FARMER: I shall be very pleased to do this sir.

Mr. RYAN: Mr. Chairman, I have read this through in English. It seems to be an important document and, therefore, I suggest that the document, in both French and English be made an appendix.

The CHAIRMAN: Is it agreed that the statement on Bill No. C-87, "Alcohol and traffic safety", in both English and French, be made an appendix to today's proceedings, a copy in the French language to be supplied later by Mr. Farmer?

Some hon. MEMBERS: Agreed.

Mr. FARMER: Mr. Chairman and gentlemen, the question was posed: "What is the involvement of alcohol in traffic accidents?". As I think you are aware, the Council does support Bill No. C-87. We feel that the present sections of the Criminal Code of Canada, namely sections 222, 223 and 224, should be repealed, because in our opinion they discriminate in favour of the drinking driver and do not protect the innocent. They constitute an exception to the rules of evidence. They are an obstacle to law enforcement. It is in the interests of public safety that a true disclosure be made of the blood alcohol level of all drivers suspected of intoxicated or impaired driving.

The Grand Rapids Survey, which I believe, gentlemen if any of you have had an opportunity to read it, is one of the classics in alcohol research as far as

traffic accidents are concerned. I have it in my hand here. This is one of the few controlled research surveys done on this problem, and it has gone into it in considerable detail.

To comment briefly on the results of the Grand Rapids Survey which was carried out incidentally by the department of police administration of Indiana University their findings are that in 20 per cent of accidents drivers had a positive blood alcohol level, and that these drivers represented 11 per cent of the driving population. In non-accident statistics these are samples taken from drivers who were not involved in accidents 11 per cent of the drivers had positive blood alcohol levels. I have appended to this some of the statistics which we took from the Grand Rapids Survey.

To go on to just one or two highlights, in every case the higher blood alcohol levels are associated with more frequent accident experience, and in general accident experience increases rapidly as the blood alcohol level approaches and exceeds .05 per cent. This association is so strong that any other explanation of the frequency of accident experience of drivers in the higher blood alcohol range can be substantially ruled out. You will notice that on page 2 of the statistics that we have appended, the accident probability goes from 1 at zero blood alcohol level to 7 times at .10 per cent to 25 times at .15 per cent, and above .15 per cent blood alcohol level it is extremely high. Again on page 2, drivers with blood alcohol level of 0.05 per cent and higher, cause 15 per cent of the accidents, while accounting for just over 3 per cent of the driving population. Drivers with blood alcohol levels of 0.10 per cent representing less than 1 per cent of the driving population, accounted for almost 10 per cent of the accidents. Drivers with .15 per cent blood alcohol level accounted for 6 per cent of the accidents, but were only .15 per cent of the driving population.

Also I think the question was asked, which I have answered, on the involvement of non-accident drivers—11 per cent, and I think this can be seen from table 1. Table 2 is interesting, it shows the involvement index with varying levels of blood alcohol. I think tables 9 and 10, which are listed, also give some idea of the involvement, particularly in the higher blood alcohol levels.

Yesterday, Dr. Ward Smith called me. Since going back to Toronto he had an opportunity to look into his department's reports this year on blood tests they have taken on deceased drivers. His findings were that over 50 per cent of the deceased drivers which were tested by his department had blood levels of .10 per cent or more of blood alcohol. Also I would like to quote in 1954 a survey that was taken in Toronto, which gave the following results.

Non-accident sampling, 7.7 per cent of the drivers had over .05 per cent blood alcohol. In the accident sample, 22.4 per cent of drivers had over .05 per cent blood alcohol.

Holcomb, in his paper "Alcohol in relation to traffic accidents", which was a survey carried out in Evanston, Illinois, reported that in the non-accident group 4.5 per cent of drivers had over .05 per cent blood alcohol. In the accident group, 32.4 per cent of drivers had over .05 per cent blood alcohol. He found that 12 per cent of all drivers had been drinking. This you will notice comes pretty close to the Grand Rapids Survey of 11 per cent.

Dr. William Haddon, Jr., whom we referred to earlier this morning, in his survey in Westchester County, New York, which was a survey of single car fatal

accidents, found that 83 per cent of drivers had .05 per cent or more blood alcohol.

Another survey carried out by Longettie and Barnett in San Bernardino, California, showed that in 68 per cent of San Bernardino fatalities the driver was impaired.

In general, alcoholics or problem drinkers are the main offenders in the traffic accident problem. This viewpoint is supported by authorities in Canada, United States, Great Britain and Australia. There are about 250,000 alcoholics in Canada, and it is estimated that 9 out of 10 drive. The Canadian Highway Safety Council believe that an attempt must be made to segregate the alcohol or problem drinkers from the rest of the driving public. Rehabilitation should be attempted, but if this fails these drivers should be ruled off the road.

Now, supporting this evidence, was an excerpt which came into the office yesterday afternoon, which I would like to read into the proceedings this morning. It is a study entitled "alcoholism and traffic fatalities", a study in futility. It was carried out by Melvin L. Selzer and Sue Weiss, and was published in the American Journal of Psychiatry, Volume 122, No. 7. Pages 762 to 767, January 1966. The study was undertaken to determine the incidents of chronic alcoholism in drivers responsible for fatal non-pedestrian traffic accidents. All deceased and surviving drivers in Washtenaw County, Michigan, who were responsible for fatal traffic accidents between October 1961 and December 1964 were included. Of the group, 40 per cent were alcoholic; 7 per cent were pre-alcoholic; 36 per cent were non-alcoholic. At the time of the fatal accidents 35 per cent had actually been drinking, the majority of drivers falling into the alcoholic group. This group also had a long history of serious psychopathology, being frequently paranoid, depressed, violent or suicidal. Of this alcoholic group, 45 per cent had a history of prior arrest or drunken driving and driving without licences. Two of them also had killed people in previous accidents. The group had more moving traffic violations and arrests than the non-alcoholic group. It is evident from this study that an identifiable group of alcoholics were responsible for more than one-half of the fatal accidents investigated. The authors feel that only a program that is designed to detect, restrain, rehabilitate the alcoholic driver will protect society from the eventualities which are now labelled as accidents. That concludes the quote from this study.

As I say gentlemen, this came to hand after we had prepared this late yesterday. I think it is very significant evidence, which certainly supports Dr. Smith's findings in Toronto, it certainly backs up the other surveys that we have quoted. We intend to get this paper to find out some more about it. I think those are the quoted highlights.

I would also like to bring before this committee the fact that Dr. Ward Smith in his presentation on Tuesday, referred to the fact that CTV were making a special film and program on tests that were being carried out with the co-operation of his department at Harewood Acres, Ontario, by racing car drivers. This program will be entitled ".08" and will be shown on the CTV network on Thursday December 15th, from 9.00 to 9.30 p.m. eastern standard time. I think this would be a film that, certainly, we on the Canadian Highway Safety Council wish to see, and we would think that most people interested in this subject would also wish to see it.

I also would like to leave with the committee as evidence a report of the Ontario Department of Highways on fatal motor vehicle traffic accidents on the King's highways. This is May 1966, and it is a typical one. I took it yesterday and went through it. It lists the fatal accidents on the King's highways in Ontario. This particular report shows that drinking was involved in 50 per cent of the accidents, 51 per cent of the fatalities, and if you take out the pedestrian and the motorcycle, the involvement of drinking goes up to 57 per cent. If it is acceptable, Mr. Chairman, I would like to leave this copy with the committee for the members to see.

I believe Mr. Chairman, that what raised the question on this matter of involvement of alcohol in traffic accidents on Tuesday, was some information that was presented to this committee. I do not have this, but I believe it was information that came from "Accident Facts 1965"—statistics relating to motor vehicle traffic accidents put out by the Ontario department of transport. I hope I am right in quoting these figures because I think these are the ones. In all accidents: ability impaired, 1.7 per cent; had been drinking, 6.1 per cent. In fatal accidents: ability impaired, 2.3 per cent; had been drinking, 13.8 per cent. Assuming, Mr. Chairman, that these were the figures that were presented to you, I have contacted the Ontario Department of Transport, who have advised us, which we felt would be the case, that these statistics they quote are compiled from police reports of accidents, and though on many cases the police may suspect that the driver had been drinking, this does not appear in this report. I think you can understand this—if there is an accident on the highway he may smell of alcohol, but if there are no obvious signs of impairment he will not report this. I have talked to the Royal Canadian Mounted Police about this and they say this is a fact, that this is the way they are forced to operate. I think that this, gentlemen, would explain the discrepancy between these figures which are reported and the figures that I have tabled with you today.

This, gentlemen, concludes any evidence that I wish to submit to the committee at this time on alcohol and highway traffic. I hope that it has been of some use. If there is any further help that we can give to you we would be more than pleased to do so.

The CHAIRMAN: Thank you very much Mr. Farmer. Have you a letter from the Department of Transport?

Mr. FARMER: I have; I do not know whether I should table this.

The CHAIRMAN: Well, I think that having mentioned it and related your comments on it, it should be filed with the committee.

Mr. FARMER: All right. I do not suppose there is anything wrong with it. I asked them a question and this was the reply I got.

The CHAIRMAN: It is agreed by all that it should be appended or included as an appendix to today's proceedings?

We have this report of the Ontario Department of Highways on fatal motor vehicle traffic accidents on the King's highway only. I presume Mr. Farmer has gone through it and has written down at the bottom "drinking, 50 per cent of the accidents and 51 per cent of the fatalities". That, I take it, is taken from this. May I have that letter.

Mr. FARMER: Sir, could I obtain a copy of this for our file?

The CHAIRMAN: We could have one photostatted, yes.

Is it agreed that these will be included as either appendices or exhibits? I think probably they would be better as exhibits, but that is up to you to decide. With the observations that I have made about it, this will be included as an exhibit, and the letter from the Department of Highways will be included as an exhibit also.

Some hon. MEMBERS: Agreed.

The CHAIRMAN: Well, now, Mr. Mondoux, do you want to say anything at this stage?

Mr. MONDOUX: Mr. Chairman, I was here to help Mr. Farmer answer questions. Mr. Farmer made a presentation.

The CHAIRMAN: I have Mr. Mather, Mr. Tolmie, Mr. Honey and Mr. Ryan.

Mr. MATHER: Mr. Chairman, I only have one brief question. First of all, I would like to say that I was much impressed by the brief and the presentation made by the Canadian Highway Safety Council. I feel that it covered in a very clear way every aspect of what we have been discussing up until now.

On the basis of your figures, something more than 400 people are being killed every month in Canada on the highways, and rather more than 40,000 people are being injured every month on our highways. This is not even mentioning a three quarters of a billion dollar annual toll which is the direct economic loss associated with these accidents. Naturally, this is a major national problem. Your organization states that it is the national body which seeks to co-ordinate, and in fact does so, efforts toward reducing this toll. With that preamble it seems to me that it sets the picture for my question.

What amount of federal or provincial financial assistance does the Canadian Highway Safety Council receive for its effort?

Mr. FARMER: The Canadian Highway Safety Council, up until this summer, was receiving \$25,000 per annum from the federal government. This was increased this year to \$40,000. We have asked the federal government for a sum of \$50,000, which we feel is a very minimal amount that would be required to start in the many programs we should embark on to tackle this immense safety problem. We are receiving—I have not the exact figure—about \$28,000 from the provinces. In other words, up until this last summer we have been receiving more money from the provinces than from the federal government. Over two-thirds of our support has come from business and industry, and we have been asking them to give on the basis of 50 cents per employee. Some may wonder where this \$250,000 comes from. The government, including the armed services, has about 460,000 people on their payroll. If you took 50 cents per head that would be \$230,000. Each and every day in Canada there are 14,000 hospital beds which are taken up by accident victims. The government is talking about Medicare; I think you can see the tremendous drain which is going on in that direction that we are paying for, to say nothing of the insurance they must have on their vehicles. The Canadian Highway Safety Council is the sole support of the National Safety League of Canada. We are working in many fields, including those which concern the federal government. We are working in fields associated with the Department of National Health and Welfare, and we work with the

Justice Department. We work with the Department of Transport, The Department of Agriculture—we have been asked to undertake the farm safety program by various groups across Canada, as well as with a number of other groups in the federal government, including labour and industry, who, we feel, we are working in conjunction with. We are concerned with safety in all these fields. We feel the council has done a reasonable job with the resources we have had available. We have not done the job that should be done and what could be done. We require additional support not only from the government, but from industry and all associations that are interested in safety. I hope that answers the question, Mr. Chairman.

Mr. MATHER: Thank you.

Mr. TOLMIE: Mr. Farmer, I am not quite sure from your evidence whether you would endorse a national safety code which of course would force all automobile manufacturers to incorporate certain safety features in their cars. Is your committee behind this?

Mr. FARMER: Are we talking of car safety devices sir?

Mr. TOLMIE: Yes.

Mr. FARMER: Yes, we are fully in support of that, as we have so stated in our brief. We have gone on record as favouring and supporting the establishment of minimum safety performance standards for all automobiles manufactured and/or imported for sale in Canada. We further go on to say that we feel that these should be North American in scope. We say that these should be mandatory to get away from the competitive aspects and to make sure that they are put in all automobiles. We have left the constitutionality of this thing to the legal authorities. We are basically concerned in seeing that the mission is accomplished, not how it is accomplished; and anything we can do to support it we will do. I hope that is clear. We are definitely in favour of minimum standards and, as they should be, mandatory standards.

Mr. TOLMIE: The only point you make here is that you have certain reservations about the proposed bill as far as mandates are concerned.

Mr. FARMER: This is right, sir. We have tried to be constructive in our approach to these bills. We certainly compliment the members of this committee and the members of the House who have put forward these ideas because, as I say again, the general intent and idea is that we need car safety features. We are in support of this. We think we see certain things that would not be quite right in the way the bill has been worded.

Mr. TOLMIE: Now, Mr. Farmer, this brief is directed chiefly towards new cars and automobile manufacturers. Of course the majority of cars on the road today are used cars. If this is so, should not a more definite attempt be made to force used car drivers, the ordinary driver, to incorporate certain minimum safety features in his car, if we are really serious about trying to eradicate accidents.

Mr. FARMER: Certainly, we should try to do this. The sooner we can get safety devices into cars, the better. I think we have outlined that the seat belt is a device that can be installed, I would think, in any car.

Mr. TOLMIE: Would your committee recommend legislation which would force all car drivers to have certain minimum standards?

Mr. FARMER: I would think yes, but of course this would have to be within reason. I think you realize what I am talking about. If you limit it to things that the owner of the car could put into it fairly easily or without great modification or cost, then this should be done—I am thinking about seat belts as just one item. We would say yes, this should be done.

Mr. TOLMIE: The reason I bring this up is that most of the witnesses devote a great proportion of their time and thought to new cars, and to my way of thinking there is a certain skirting of the fact that the essential point is to have safety devices put in the cars now being used.

You also state that 85 to 90 per cent of traffic accidents result from driver error, and I assume this to be correct. If this is so, then should not most of your attention be devoted to improving driving habits? I was just wondering if you would recommend say, stricter tests before drivers receive their licences. And after they do receive their licences should there not be periodic examination? If this is the crux of the matter—85 or 90 per cent—then why is there not more effort devoted to this sphere?

Mr. FARMER: We have, as stated in our brief, always advocated what we call a balanced program. We agree that minimum car safety standards are essential. We also have been expending a great deal of our efforts in the field of driver education. We believe that educating the public in proper driving habits, to avoid the accident in the first place, is one of the very important factors. In other words, if we spent all our time on car safety devices and disregarded the rest of it, it would be similar to giving a tuberculosis patient cough medicine; it might cure his cough but it would not cure the disease. I think if you look at our presentation which we have left with you, you will agree that the Canadian Highway Safety Council has expended quite an effort in the field of driver education. We not only do this, but we believe in a program that starts with the pre-school child.

We have a national program called "Elmer, the Safety Elephant" program, which is slanted to the youngsters from kindergarten to grade 4. In communities where this program has been carried out the accident rate involving school children has gone down up to 50 per cent in nearly every case. We also sponsor and advocate bicycle safety programs to educate the young people to learn to operate a vehicle properly in traffic and, incidentally, also to reduce accidents. We advocate high school driver education. Where high school driver education has been put into the schools, accidents have been reduced 50 per cent, and violations reduced by 81 per cent.

One of the great concerns we have is that most young people today obtain their driver's licence without proper driver education. This year, in 1966, we estimate that nearly 385,000 young Canadian boys and girls will come of driving age, yet a survey that we did this year shows that less than 4 per cent of these young people actually will have the opportunity to take a driver education course. We go further than this; we believe that there should be re-education programs. We have a program called our Driver Improvement Program, which is aimed at the person holding a driver's licence, to upgrade their driving. We have pretty good evidence to suggest that well over a million Canadians obtain their driver's licence without any form of test whatsoever. This is an alarming thing, when many of us learned to drive, there were no expressways. Speed limits were 40 miles an hour. Techniques have changed and people should be upgrading

their knowledge. This whole problem of education is a continuing one. We must have a continuing education program for the pedestrian. Twenty-seven per cent of our fatalities last year were pedestrians. This is a big program. Going beyond that, we are on record as advocating periodic driver re-examination. We feel this should be done. That program that was put on last year, "The Canadian Driver's Test", which we were privileged to have a hand in, indicated that possibly 42 per cent of Canadian drivers might fail to pass the test if they were given one.

Mr. TOLMIE: Mr. Farmer, if this is so important—and from your evidence it is—would it not be good policy on the part of your committee to bring your influence to bear in provincial governments to make it mandatory to pass driver education courses and get a certificate before licenses are granted. This would put teeth into your program.

Mr. FARMER: We have been at this a number of years now. We have a program qualifying high school driver education teachers. This summer we qualified 407 high school teachers to teach driver education in Canadian high schools. This is a start, it requires a lot of money, we spent something like \$52,000 of our budget on this alone. We have trained 11,000 so far in Canada, and this is a continuing program. We have advocated this, and we feel that we are on the verge of a major breakthrough with the provinces. The Province of Quebec this year has made high school driver education mandatory in all vocational schools. We are hoping that next fall it will be compulsory in all secondary schools in the province. The Province of Alberta is looking very seriously at this. The Province of Saskatchewan now are giving the course to about 25 per cent of the secondary school pupils, and they expect to make it mandatory next fall. We have been talking to most of the provinces and there is evidence coming in now that we are on the verge of a breakthrough in this field. In Ontario there will be 200 schools this fall giving driver education. This is a big program and it requires a lot of money. It has been a hard one to sell, particularly to departments of education and school boards which feel that their programs are already very full.

The CHAIRMAN: Thank you. Mr. Honey is next, followed by Mr. Ryan and Mr. Guay.

Mr. HONEY: Mr. Farmer, has the council facilities for doing research work in automobile safety features.

Mr. FARMER: No sir, we have not.

Mr. HONEY: Do you have to rely then on recommendations from institutions or organizations who have these facilities, such as the automobile manufacturers?

Mr. FARMER: This is right, sir, we rely on studies that have been done by the automobile manufacturers, by a number of universities, and there are a number of private institutions which are doing research work in this field.

Mr. HONEY: What are some of the private institutions, Mr. Farmer?

Mr. FARMER: I was thinking more of universities when I said that.

Mr. HONEY: So it is pretty well limited to universities and the automobile manufacturers.

Mr. FARMER: This is right.

Mr. HONEY: Do you find much divergence, if any, in the findings and recommendations of the manufacturers as opposed to the university groups?

Mr. FARMER: I do not know that I can answer that question fairly. Certainly in the papers that I have been privileged to read, and the meetings that I have attended—two weeks ago I went down to the Staff Car Crash Conference—it appears that they are working toward the same end. I have not seen any radical differences of opinion.

Mr. HONEY: Is there a fallacy that there is a danger in wearing seat belts? Some people say that it is debatable whether or not seat belts are helpful, you know how such things get around. Have you a comment on this?

Mr. FARMER: This unfortunately has been a deterrent to the use of seat belts. This is a problem that we try to overcome by public information releases, articles and newspapers. You meet people quite often who are violently opposed to using them because they have some idea that they may be trapped in the car and so on.

Mr. HONEY: That is a concern of yours, is it?

Mr. FARMER: That people have been given the wrong information or assume the wrong information?

Mr. HONEY: Yes.

Mr. FARMER: The facts show that, as you have seen here today—

Mr. HONEY: Oh, we have seen the facts, yes, I wondered if this opinion or fallacy was a real thing that does concern you.

Mr. FARMER: Just how prevalent it is, it is difficult to say. Certainly I would say that the majority of the public have assured themselves that driving around town they are quite safe without doing up the seat belt, whereas we know that this is not true.

Mr. HONEY: I suspect this excuse is used by people who probably do not like to be bothered using the seat belt.

Mr. FARMER: This is right. I was talking to a garage owner one day and he said that I would be amazed at the number of people who come in and ask him to remove the seat belts, their excuse apparently being that they are too uncomfortable to sit on. This is the type of thing you are up against.

Mr. HONEY: Thank you, Mr. Chairman. I hate to ask questions and then leave, but I have an appointment. I thank Mr. Tolmie for letting me proceed.

Mr. RYAN: Mr. Chairman, I would like to ask Mr. Farmer if the Canadian Highway Safety Council is incorporated; if so, how?

Mr. FARMER: We are incorporated under federal charter as a non-profit organization.

Mr. RYAN: Have you any competitors with a federal or provincial charter in his field in Canada?

Mr. FARMER: No sir—well, there are other provincial safety councils which are supporters of ours.

Mr. RYAN: And they work harmoniously with you in all cases.

Mr. FARMER: Yes sir. They are members of our executive.

Mr. RYAN: Do you gather accident statistics for your own use or do you depend upon the Dominion Bureau of Statistics for them?

Mr. FARMER: We use the Dominion Bureau of Statistics; we also gather statistics for our own use. We have a system set up with all the major cities in Canada over 5,000 population. We get reports from them twice a year on their accident picture. We publish the facts on this.

Mr. RYAN: This committee has had evidence from a prior witness to the effect that accident statistics in Canada is very difficult to obtain with any great degree of accuracy because there are so many jurisdictions and the various police departments have different standards for making up their reports. Do you find this to be the case?

Mr. FARMER: I think that we are getting reports that are probably reasonably accurate with regard to what is being asked. Now there are certain problems to this; these are police reports and they are not gone into in any great depth. I think we have to recognize this. There are two things required, one of which is to collect general data on all accidents, which should be as simple as possible. But to go beyond this, to go into it in depth, to get research statistics on which to base your accident prevention programs, your car safety designs, and so on, would require research in depth on a segment of the accident problem.

Mr. RYAN: Do you consider the fact that you cannot have absolute confidence in your statistics a great weakness in your field?

Mr. FARMER: Let us put it this way; I think that we could be aided greatly by better and more statistics. However, I do feel that we have a great deal of evidence today to support certainly the major programs we are embarked upon. In other words, we still feel quite sure, for example, that education of the young people in the schools, driver education—

Mr. RYAN: If I can interrupt you, that is in a different area than what I am talking about.

Mr. FARMER: Are you thinking of car safety sir?

Mr. RYAN: I am thinking of the statistics and reporting that you are getting; is it good or is it bad? Does it give you a substantial picture or does it just give you part of the picture?

Mr. FARMER: To answer the question specifically, it only gives part of the picture, yes.

Mr. RYAN: Is there anything your council could do to improve this picture? Have you any thoughts along that line?

Mr. FARMER: We have been talking to the motor vehicle administrators, who are really the ones in each province who gather these statistics, and they in turn report them to D.B.S. The last provincial federal conference which we had the privilege of participating in was in 1955 or 1956 I believe—I am not sure of those dates. We are hoping that one will be reconvened within the next few months to go into this picture. I think we must realize that this is fairly complicated and we must have some really definite ideas of what we want in the way of facts; what do we need to carry out our research programs, whether they are educational or designed programs.

Mr. RYAN: Well have you a standard report that you are prepared to recommend to all jurisdictions and police commissions across the country?

Mr. FARMER: There is a standard report that I think is being used, which is one that was agreed on by the provinces and the D.B.S. There is also a standard form of reporting.

Mr. RYAN: I take it the breakdown today is coming from the individual accident report not being complete in some cases or no report at all being turned in in other cases when there should have been. There would be a weakness in this.

Mr. FARMER: Well I do not say that is the prime weakness. I think that it depends again what date you are trying to get out of the report. I do not think that you can design one form which will give you all the information that you would require to do research work. It would be too complicated. The police officer himself, for example, would not be capable of going into an accident in detail to determine the cause of the accident, and so on. This would require a team of skilled people: engineers, medical people, and other research people, and I think that on this basis you cannot do that across the board. I think it was Dr. Mosley, in his study in the United States, who said that something between one and two hundred fatal motor vehicle accidents that he investigated in depth with a team of research people engineers, doctors, so on, cost him something in the neighbourhood of half a million dollars. So you can see this is a very, very costly investigation, and I do not think it would be necessary to do anything like this across the board to get us the information that would be required to develop programs, whether they are educational or engineering programs.

Mr. RYAN: What other plans have you for spending the extra money you are asking for now in your budget.

Mr. FARMER: There are many areas, sir, that we should be getting into in the educational field. We should be doing this driver improvement program which we have been given Canadian rights to, which will take, we estimate, at least 100,000 to fund and make it self supporting. We would like to get into the field of carrying out a traffic safety inventory of all the major cities in Canada, and this will take considerable money—in other words, to go in each year and study their accident problems. In the statistics field there are many things we would like to do, get out proper statistics, public information pieces on safety and so on. We would like to spend more money in the education field; we would like to do more in the co-ordinating field between the provinces and between research groups; also in the publishing of information that comes up. We are very limited in what we can do with our present resources. There is no end to what we can be doing. To be quite frank, we are scratching the surface on this problem.

Mr. RYAN: Thank you.

The CHAIRMAN: Mr. Guay.

Translation)

Mr. GUAY: This question might be out of order, but regarding the matter of second-hand vehicles which was brought out by Mr. Tolmie just now, have you got a procedure which must be used to guarantee that these vehicles should be provided with minimum safety devices. Have you thought of such a form?

Mr. MONDOUX: With your permission, Mr. Chairman, I will answer Mr. Guay. Mr. Guay, in this respect we have not prepared a procedure of that kind that we could put before the Government to ensure inclusion of safety devices in automobiles, but there is already a form which is more or less accepted and I think it is just a question of time before it is generally accepted, and that is compulsory inspection of automobiles. You have voluntary inspection in Quebec at the present time, you have a sort of compulsory inspection in Ontario. It becomes obligatory if a policeman tells a driver that he has to submit to it. In British Columbia you have inspection, you also have it in its voluntary form in Alberta and Saskatchewan. And in the Maritime Provinces, they are talking about it. It is just a matter of time before we get compulsory mechanical inspection. This is the way to ensure the inclusion of safety devices which will be considered essential to the safety of the driver in Canada.

As for passing legislation *a priori*, so to speak, if the present bill is to contain a provision obliging drivers of old vehicles to put certain safety devices in them, the only means of enforcement would be through a system of compulsory inspection, by the provinces of course.

Mr. GUAY: You say 12 years, is that not a long time? I am referring to page 10 of your report, where you say it would take about 12 years.

Mr. MONDOUX: Yes, because so far we have been of necessity obliged to look at things as they are and we must take account of the fact that the driver doesn't do things voluntarily. When you have voluntary inspection, and you have a driver who is afraid his car may have something wrong with it, then he will not go anywhere near an inspector. At the present time you have no means of forcing a driver to put this or that device in his car, but, even so, there is an infringement of personal freedom, unless the device is essential for saving lives. You have to decide this before you take this aspect of the law into consideration. In some of the States of the United States they do force you to install seat belts but not to fasten them on. There is one particular city, I cannot remember its name, where somebody proposed a municipal ordinance to force every driver in his car to fasten his safety belt, and they tried it out to see how the public would react. You can be quite certain that if that were done federally there would be a civil war.

Mr. GUAY: Do you not think that there is something that could be done through the automobile insurance companies; they could declare a person non insurable, if he did not put in safety devices. As you know in the Province of Quebec if you have an automobile accident with damages over \$250, the driver has to take out new insurance and submit to a driving examination. So in the Province of Quebec, there is a certain control over accidents, but it seems to me that the automobile insurance companies would be very useful here?

Mr. MONDOUX: I think the Committee would be entirely in agreement with you. Some companies are seriously thinking of offering reduced premiums for cars which do have safety belts. This sort of thing is quite possible because insurance companies are really bothered about reducing the number of serious accidents and, of course, the high claims which follow.

(English)

Mr. FARMER: Mr. Chairman, if I might comment, the city in the United States that put in this ordinance requiring seat belts to be fastened or the owner would be subject to a fine, was the city of Brooklyn.

There is also another very interesting item on seat belt liability, which we have noticed here and which is along the line you suggest sir. A Texas jury has found the plaintiff's failure to wear a safety harness with which the car was equipped, was contributory to negligence and therefore reduced the plaintiff's recovery damages by 95 per cent. So it looks as though the insurance companies are looking very seriously at this now, and things like this will certainly have an impact on the driving public. When they learn that they may have 95 per cent of their claim washed out for failure to wear a seat belt, this would, I think, be an incentive for them to do something about it.

Mr. McCLEAVE: I was wondering how the council operates. We have heard statements from Mr. Farmer and his associate this morning. Are these statements or pronouncements on behalf of the council the result of the council having passed resolutions, for example?

Mr. FARMER: On car safety?

Mr. McCLEAVE: Yes, on any topic that you have discussed with us here this morning.

Mr. FARMER: Yes sir.

Mr. McCLEAVE: How does the authority work? Do you get the right to speak from what council has decided?

Mr. FARMER: Yes. I think I stated that council policy is carried out by our executive committee. We have a national safety conference every year, which people from all across Canada attend. Resolutions are put before the conference, and we pass certain things. Nearly every year in the last ten years, for example, we have had resolutions on your bills, as well as on sections 222, 223 and 224 of your Criminal Code, which we want repealed. We do consider definite items such as safety devices and so on, and pass resolutions on them.

Mr. McCLEAVE: I was not sure, in answer to the last witness, whether you said the council had considered resolutions dealing with safety devices for older cars, but had not adopted the same.

Mr. FARMER: To my knowledge, we have not considered resolutions on older cars per se, no.

The CHAIRMAN: Is that all Mr. McCleave?

Mr. McCLEAVE: Yes, thank you very much.

The CHAIRMAN: Mr. Latulippe, you are next.

(Translation)

Mr. LATULIPPE: I do not have very many questions to ask. I do recognize that it is late.

(English)

The CHAIRMAN: I know it is late, but we want to hear you.

(Translation)

Mr. LATULIPPE: I will reserve my questions for some future occasion, but I would like to thank the Canadian Highway Safety Council for its brief. There are certainly very many improvements which are necessary for highway safety. What you do is certainly worthwhile and is of great help to society at large. But

the small question I would like to ask you refers to insurance. We will agree that at the present time there are many accidents which are very expensive. The insurance policies are very expensive. If somebody has an accident and sees his premium raised, would it not be better to ask the provinces—since it is under provincial jurisdiction—to have some kind of standardized automobile insurance because I believe that the insurance companies exercise a control which is all their own and which is really in their favour rather than in favour of the insured. I feel the insurance companies really go a little too far. I wonder whether there should not be another solution. I believe that the various levels of government should have some kind of an insurance at reasonable levels to compete with private insurance companies.

(English)

Mr. FARMER: Mr. Chairman, if I might answer, I would say that this is definitely outside the sphere of the Canadian Highway Safety Council; it is not really safety *per se*.

In answer to your question sir, I do not think that we would be in a position really to speak to it. Because I would not consider this a safety problem in that regard I would prefer not to make any statement. We do not think this is at all within our sphere of action.

The CHAIRMAN: Well, it is certainly a matter of provincial government policy, maybe even federal government policy. I think the province of Saskatchewan has insurance legislation. I know it insures the drivers of automobiles, but whether that increases the safety on the highways or not is a debatable point. It does provide for compensation to people who are injured or suffer property loss.

Have you any more questions Mr. Latulippe?

Mr. LATULIPPE: No, Mr. Chairman.

The CHAIRMAN: Mr. Farmer and Mr. Mondoux, I can assure you that we all have listened with a great deal of interest to what you have had to say. We thank you for coming and particularly for your courtesy in remaining so that all questions could be asked.

APPENDIX 11

CANADIAN HIGHWAY SAFETY COUNCIL
LE CONSEIL CANADIEN DE LA SÉCURITÉ ROUTIÈRE

Bill C-87—Alcohol and Traffic Safety

The Canadian Highway Safety Council supports Bill C-87. Present sections 222, 223 and 224 of the Criminal Code should be repealed because they:

1. discriminate in favour of the drinking driver and do not protect the innocent;
2. constitute an exception to the rules of evidence;
3. are an obstacle to law enforcement; and
4. It is in the interest of public safety that true disclosure be made of the blood alcohol level of all drivers suspected of intoxicated or impaired driving.

Grand Rapids Survey (Refer to statistics)

20 per cent accidents—drivers had positive blood alcohol levels; 11 per cent of driving population.

Non-accident—11 per cent of drivers had positive blood alcohol levels.

1966 Report Ontario Attorney General's Laboratory—

Over 50 per cent of deceased drivers had .10 per cent or more blood alcohol.

1954 Toronto Survey—

Non-accident—7.7 per cent of drivers had over .05 per cent blood alcohol.

Accident—22.4 per cent of drivers had over .05 per cent blood alcohol.

Holcomb—Paper—Alcohol in Relation to Traffic Accidents (Evanston, Illinois)

Non-accident—4.5 per cent of drivers had over .05 per cent blood alcohol.

Accident—32.4 per cent of drivers had over .05 per cent blood alcohol. 12 per cent of all drivers had been drinking.

Dr. Wm. Haddon

Westchester County, N.Y.—Survey of single car fatal accidents. 83 per cent of drivers had .05 per cent or more blood alcohol

Longhetti & Barnett Survey—San Bernardino, California.

68 per cent of San Bernardino fatalities, driver was impaired.

Alcoholics or problem drinker are the main offenders. This viewpoint is supported by authorities in Canada, United States, Great Britain and Australia.

There are about 250,000 alcoholics in Canada and it is estimated that 9 out of 10 drive.

An attempt must be made to segregate the alcoholic or problem drinker from the rest of the driving public.

Rehabilitation should be attempted, but if it fails, these drivers should be ruled off the road.

Use of the Breathalyzer—

1. Substantiate evidence in cases of suspected impaired or intoxicated driving.
2. Occasional blockade.

STATISTICS FROM GRAND RAPIDS SURVEY

Driving with blood alcohol levels up to 0.08 per cent are less frequently observed in the accident-involved group than in the non-accident group.

Drivers with alcohol levels over 0.08 per cent are over-represented in the accident group with the amount of over-representation increasing with the alcohol level.

In the accident group alone the drivers with blood alcohol levels up to 0.04 per cent are under-represented while drivers with blood alcohol levels greater than 0.04 per cent are over-represented. Moreover, the amount of over-representation tends to increase as the blood alcohol level increases. Drivers with blood alcohol levels of 0.15 per cent and higher have the worse accident experience and there are 18 times as many drivers found in the accident group than would be expected on the basis of the non-accident sample.

Drivers in the blood alcohol range 0.05 per cent to 0.15 per cent appear twice as frequently in the accident as in the non-accident group indicating that drivers in this blood alcohol range are contributing more than their proportional share to accidents.

In every case, the higher blood alcohol levels are associated with more frequent accident experience and, in general, accident experience increases rapidly as the blood alcohol level approaches and exceeds 0.05 per cent. This association is so strong that any other explanation of the frequency of accident experience of drivers in the higher blood alcohol range can be substantially ruled out.

Based on the results of the Grand Rapids Survey, the probability of having an accident after drinking goes something like this:

<i>Blood Alcohol</i>	<i>Accident</i>
<i>Level</i>	<i>Probability</i>
0.00%	1.0
0.03%	0.6
0.04%	1.0
0.06%	2.0
0.10%	7.0
0.15%	25.0
above 0.15%	very high

Drivers with positive alcohol levels caused more than 20 per cent of all accidents while constituting about 11 per cent of the driving population.

Drivers with a blood alcohol level of 0.05 per cent and higher caused 15 per cent of the accidents while accounting for just over 3 per cent of the driving population.

Drivers with blood alcohol levels of 0.10 per cent representing less than 1 per cent of the population accounted for almost 10 per cent of the accidents.

Drivers with over 0.15 per cent blood alcohol level accounted for 6 per cent of the accidents and were only 0.15 per cent of the driving population.

Table 1
DISTRIBUTION OF ALCOHOL LEVELS

Group: Alcohol Level	Non-Accident		Accident		Non-Accident			Accident

HOUSE OF COMMONS
First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE
No. 19

TUESDAY, NOVEMBER 29, 1966

Respecting the subject-matter of
Bill C-105, An Act to Amend the Criminal Code (Insanity)

WITNESSES:

Mr. Andrew Brewin, M.P., Sponsor of Bill C-105; Professor Stanley Beck,
B.A., LL.B., LL.M.; and Professor Stuart Ryan, Q.C., B.A., LL.B.

LIBRARY
ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
JAN 24 1967 OTTAWA, 1967

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS
Chairman: Mr. A. J. P. Cameron (*High Park*)
Vice-Chairman: Mr. Yves Forest
and

Mr. Addison,	Mr. Honey,	Mr. Nielsen,
Mr. Aiken,	Mr. Laflamme,	Mr. Otto,
Mr. Choquette,	Mr. Latulippe,	Mr. Ryan,
Mr. Fulton,	Mr. MacEwan,	Mr. Scott (<i>Danforth</i>),
Mr. Goyer,	Mr. Mather,	Mr. Tolmie,
Mr. Grafftey,	¹ Mr. McCleave,	² Mr. Trudeau,
Mr. Guay,	Mr. McQuaid,	Mr. Wahn,
		Mr. Woolliams—24.

(Quorum 10)

¹ Replaced by Mr. Pugh, November 24, 1966.

² Replaced by Mr. Whelan, November 28, 1966.

Timothy D. Ray,
Clerk of the Committee.

ORDERS OF REFERENCE

THURSDAY, November 24, 1966.

Ordered—That the name of Mr. Pugh be substituted for that of Mr. McCleave on the Standing Committee on Justice and Legal Affairs.

MONDAY, November 28, 1966.

Ordered—That the name of Mr. Whelan be substituted for that of Mr. Trudeau on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House of Commons.

MINUTES OF PROCEEDINGS

TUESDAY, November 29, 1966.
(23)

The Standing Committee on Justice and Legal Affairs met this day at 11.20 a.m. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Addison, Aiken, Cameron (*High Park*), Forest, Grafftey, Goyer, Guay, Honey, MacEwan, Mather, Ryan, Tolmie (12).

In attendance: Mr. Andrew Brewin, M.P., Sponsor of Bill C-105; Professor Stuart Ryan, Q.C., B.A., LL.B.; and Professor Stanley Beck, B.A., LL.B., LL.M.

The Chairman introduced Mr. Brewin who made a statement on his Bill C-105. Professor Ryan and Professor Beck in turn made statements covering their written presentations.

The witnesses distributed various material to the Committee.

Agreed,—That the extract from Mental Disability and the Criminal Law pp. 30-372, the extract from Canadian Psychiatric Association Journal, June, 1964, Vol. 9, pp. 227-231 and copy of the case United States v. Freeman, United States Court of Appeals—Second Circuit, Federal Reporter 2nd Series, Vol. 357, p. 606-629, be made exhibits (Exhibits 17, 18 and 19 respectively).

Agreed,—That Criminal Insanity (From M'Naghten to Durham) prepared by the Research Branch, Library of Parliament, November 17, 1966 Mental Abnormality and the Criminal Law, by Professor Stuart Ryan, and Alternatives to the M'Naghten Rules by Professor Stanley Beck, be appended to today's Minutes of Proceedings and Evidence (See Appendices 12, 13 and 14 respectively).

After questioning, the Chairman thanked the witnesses for their kind cooperation and contributions to the Committee's proceedings.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, November 29, 1966.

The CHAIRMAN: Gentlemen, we have a quorum. I would like to remind the members of the Committee of our trip to Windsor. We leave from the centre block at 7.30 by bus to go to the airport. You have all received a copy of the itinerary. I understand present prospects are that there will be between 16 and 18 members of the committee on the tour. I think it is going to be very, very interesting. I will say no more on that, except to remind you to please be prompt at 7.30 so that there will be no delay in our departure.

Now, I have the honour to introduce our witnesses today. First of all, we have with us my friend and partner, Mr. F. Andrew Brewin, Q.C. We were partners for a good many years in the practice of law. I do not know whether or not we are partners in the practice of politics. Mr. Brewin is a distinguished counsel. He is particularly interested in underprivileged people. He is particularly interested in seeing that people receive a fair trial which brings him to the proposition of considering the M'Naghten rules which have been a standard of judicial evidence for a long, long time. You have all heard Mr. Brewin in the house and know of the active part he takes in all the debates of that chamber.

We also have with us today Professor H. S. Ryan of Queen's University. He obtained his B.A. from the University of Toronto in 1930, was called to the bar in 1933. He practised law from 1934 to 1957, interrupted between 1940 and 1946, during which time he was in the Canadian Army. In 1948, he became a Queen's Counsel. He has been a professor at Queen's University in the faculty of law since 1957, teaching criminal law and criminology, as well as other subjects.

We also have the pleasure to have with us today as a witness, Professor Stanley Beck, also of Queen's University. He earned his B.A. and LL.B. at the University of British Columbia and his LL.M. at Yale University. He is a member of the bars of British Columbia and Ontario. He is on the faculties of the universities of British Columbia and Queen's, teaching criminal law and other subjects. He is the editor of the University of British Columbia case book on criminal law and is on the editorial board of the CRIMINAL LAW QUARTERLY. We have great pleasure in welcoming these distinguished gentlemen to our meeting this morning. Without further ado, I will call upon Mr. Brewin to say what he has to say about the subject matter.

Mr. BREWIN: Mr. Chairman, it is not often I receive these accolades and praise from a former partner and one who, in at least a remote sense, is still a political partner. I would like to get on with the subject as quickly and directly as I can. I introduced a bill, Bill No. C-105, which was referred to this Committee. It deals with the subject of responsibility for criminal acts of persons

who are—and I put the word in quotation marks—“insane”. I use quotations because although that is the language of lawyers, it is an expression which I understand the experts in mental science, psychiatry, and so on, do not like. The bill is quite simple. It purports or seeks to amend section 16 of the Criminal Code which at present incorporates with some differences, a famous rule of law that has been applied in all common law countries such as England, Canada and the United States with variations, which I will mention.

The M’Naghten rules as to criminal responsibility were established in 1843 by an opinion of the judges of England asked for by the House of Lords in the famous M’Naghten case. M’Naghten, as some of you know, was the chap that suffered under delusions that he was being persecuted by the Tories. As a result of this he attempted to shoot Sir Robert Peel. He did not succeed in shooting him, but he did succeed in shooting his secretary. Henry Drummond, I believe, was the name of the man. He was not guilty on the ground of insanity, but there was a public outcry, public indignation, about the finding of not guilty and the House of Lords asked for the opinion of the judges, which was given in a series of rules on insanity as a defence to criminal responsibility. Ever since, these rules have been applied in the courts under growing criticism from various people, lawyers, psychiatrists, medical experts, and so on. The Canadian code, I think in 1893, with a few variations—my colleagues will correct the details, since they are much more expert than I in this field. Section 16 says:

(1) No person shall be convicted of an offence in respect of an act or omission on his part while he was insane.

(2) For the purposes of this section a person is insane when he is in a state of natural imbecility or has disease of the mind to an extent that renders him incapable of appreciating the nature and quality of an act or omission or of knowing that an act or omission is wrong.

(3) A person who has specific delusions, but is in other respects sane, shall not be acquitted on the ground of insanity unless the delusions caused him to believe in the existence of a state of things that, if it existed, would have justified or excused his act or omission.

(4) Every one shall, until the contrary is proved, be presumed to be sane and to have been sane.

In other words, the onus is on an accused person to show that he is insane, under this definition. This definition is virtually the same as the M’Naghten rules; one notable exception is that the word “appreciate” is used instead of the word “know”. Some people—which I will mention in more detail later—have seen some great significance in the difference. As far as I am concerned I do not think there is any clear difference between knowing and appreciating. This has been called the right or wrong test; that you are not responsible if you cannot appreciate or know whether the criminal act was right or wrong.

Now, the amendment which I propose is based upon a decision of the United States court of appeals in 1954 in the case of *Durham versus the United States*. Incidentally, that was a reaffirmation of what is known as the New Hampshire rule. For over a century, the courts of New Hampshire have been applying a different rule. It is a very short and simple provision which says:

no person shall be convicted of an offence in respect of an act or omission on his part while he was insane.

That does not change the section.

(2) For the purposes of this section a person is insane . . .

If the act of omission is the product of mental disease or defect.

Subsection (3) remains the same, presumption a person must show; that is the product of mental disease or defect. So, if this rule were adopted as I understand it, in a criminal case the defence would have the obligation, first of all, to show that the accused suffered from mental disease or defect, and, secondly, that there was a causal connection between this mental disease or defect and the commission of the criminal act.

Now, may I say that ever since we have had any sort of civilized criminal law, it has been recognized that, as the criminal law is designed to punish and deter people, it would be wrong to punish and impossible to deter people whose actions are not the result of any volition or will of their own but are the result of some mental disease. The real difference is between whether people should be treated as ill people or whether they should be punished or deterred as criminals.

It has long been recognized, ever since there has been any law, in England, in the 1300's, at any rate, that people were not responsible for their actions if they were totally unable to form any intent and were so mentally unbalanced

No subject in the whole field of criminal law has been more controversial and difference of opinion owing to the growth of psychiatric knowledge and the study of the human mind on what is a proper test to determine this.

No subject in the whole field of criminal law has been more controversial and had more learned articles written about it and more differences of opinion. Of course, it is a matter of very great importance for two reasons. One, that people who are not responsible should not be punished by the law; humanity requires that. The other side of the picture is that those who are mentally ill should be treated and should be detained as long as necessary so that the substitution of a different and more up to date definition would have a dual effect, namely to prevent the criminal punishment of those who fall within the revised definition and may not be held responsible. It would also have the opposite effect, that when these people were found to be in this condition and sent for treatment, they might be detained, not for some period fixed as an appropriate punishment, but for a period that their mental health and the safety of society requires. The changes are really a double-edged sword.

Now, I think I could summarize the matter reasonably accurately by saying that there are three, or perhaps four, different ways in which this matter has been dealt with. One is the M'Naghten test, which I have given to you already and, subject to modification in the Criminal Code, is the law of Canada and the law of many other jurisdictions.

The second test might be the addition of something called irresistible impulse, which has been adopted in many cases in the United States, recognizing that mental defects or illness may have still left the knowledge of the person unimpaired but made it impossible for him to control his actions.

Third, is the Durham case, or the New Hampshire rule, which is embodied in the amendment I have proposed.

The fourth is a test originally propounded by the American Law Institute and recently adopted by, I think it is, the Circuit Court of Appeals again, the United States Court of Appeals Second Circuit in the case of the United States

versus Freeman. That was adopted in a New York case, decided in 1966. It proposes still another test, which I will give to you later and which the Committee may well think is superior to the Durham test. As far as I am concerned, the point I want to make and substantiate to you is that the M'Naghten case is totally unscientific; it was formulated in an era when there was no knowledge of psychiatry; it has been universally criticized both by medical experts and also by lawyers. If this committee were to recommend, instead of the Durham test, the American Law Institute statement or the Freeman test, I would be perfectly happy and I think perhaps Mr. Ryan and Mr. Beck may have something more to say about that.

Now, gentlemen, I do not want to take up too much time. I did provide you with what looks like a disturbing amount of reading material on the subject, but I thought that you would like to know what this is about and it would be very convenient if you were afforded some material. Before I do that, may I just give one personal statement to you. My interest in this case arose not only out of the fact that I practice law—I admit that criminal law is not a specialty of mine at all—I have had a few connections with criminal law—but because a constituent of mine, a young man by the name of Markel, also known as Robert Robertson was convicted of arson shortly after I was elected and sentenced to 24 years in the penitentiary. He gave himself up. He had burned down four or five different places; fortunately there was no loss of life. There were four or five charges. None of the things he did made any sense. It was not done for the purpose of revenge or gain, to receive insurance or anything like that. It was a clear case of some sort of a mental condition which gave him a kick out of burning places down when he had had a few drinks. He was sentenced to 24 years in the penitentiary, although later psychiatric evidence clearly established that he was a mental case. I will not try to use proper language to describe it.

His case was appealed to our court of appeal, which confirmed the sentence. There was a great outcry about this, to the credit of the press and the public. The matter was referred to the then Minister of Justice, I think it was Mr. Chevrier or Mr. Fleming as I recall it. A re-hearing in the Court of Appeal was ordered and the sentence was reduced to 12 years. This young man is now applying for parole. I think the parole board are considering his case after a few years. I do not know how he has got along; we hear very good reports that his mental condition has been cured. That is a problem for the parole board. But, the point is this. Here was a young man who gave himself up, who asked for treatment who acted clearly under the influence of mental illness and who was sentenced to a criminal for 24 years. It was because of the interest I took in this case that I propounded this revision of the law. After study, I think I have found that the proposals are consistent with an enlightened view of criminal justice and deserve the most serious consideration of parliament.

Gentlemen, I have made available this vast amount of reading material. I know, from my own knowledge, that about the only time you will find it possible to read this material will be when you are listening to the speeches of your colleagues in the house. Nevertheless, if anyone is interested in the subject, I think you will find this material very well worth while. I seem to have misplaced my copy of the first item of the material which is headed, Criminal Insanity from M'Naghten to Durham. This was prepared by a young lady, whose name is a difficult one and which I cannot remember at the moment, in the research

department of the parliamentary library. I think you will find it to be an excellent summary of the situation in regard to the law and some of the observations on this matter.

It deals with the historical background, the M'Naghten case; on page 3 it covers the codification of the law in Canada, the substitution of the word "appreciate". It deals at the foot of page 3 with the New Hampshire decision. It discusses on page 4 the irresistible impulse test. It refers at page 4 to the Durham case of 1954 and reviews that particular case. It brings out the test which I have incorporated in the bill which is before you, that an accused is not criminally responsible if his unlawful act is the product of mental disease or mental defect.

Part 2 discusses the M'Naghten rule—Page 5—I will not delay over that, except to say that there is discussion of what is meant by knowledge that the act is wrong; the word "wrong" is ambiguous, it could be morally wrong or against the law.

The CHAIRMAN: We could have this printed as an appendix, Mr. Brewin. Would that be helpful?

Mr. BREWIN: Yes, that would be very helpful. Section 9 refers to—

Mr. GRAFFTEY: Before you proceed, Mr. Brewin, I would like to ask you one quick question. As I understand, your testimony up to now, the act as it now stands Section 16, subsections (2) and (3) embody the M'Naghten rule.

Mr. BREWIN: Yes.

Mr. GRAFFTEY: Subsections (2) and (3) embody the M'Naghten rule, to be replaced by your subsection (2), which embodies the Durham rule.

Mr. BREWIN: That is right.

I might say in connection with the statement that our subsections (2) and (3) of Section 16 embody the M'Naghten rule, that a very distinguished person, who was a partner both of your chairman and myself, Chief Justice McRuer produced a report that Professor Ryan may refer you to in 1953 on criminal insanity as a defence, in which a majority of the commissioners reported against a change in the law. The burden of Mr. McRuer's argument was that he felt there was a great difference between the words "appreciate" and "know". A minority report of her honour Judge Helen Kennear—maybe known to some of you—took the different view and said there ought to be a change in the law. I have a very great respect for Mr. McRuer, whom I worked with for many years. In this particular case I think his legal ingenuity carried him too far, because I do not believe that the refinement of meaning between "appreciate" and "know" is that significant.

I would like to refer you in that connection to the words of Mr. Justice Tignault at page 10 of this brief on criminal insanity, prepared by the research department. He says this in the case of Clark versus the King at page 630.

...although we have an express declaration by the legislature, the code really adds nothing to the common law; in fact the presumption of sanity of mind, involving criminal responsibility, is recognized in England as well as in all countries, and our inquiries need not carry us further, which are subject to the common law.

So, I think he takes the same view as I do, that there is not really any substantial difference.

Now, the memorandum from the library research department goes on and deals with the American system and deals also with the irresistible impulse test, which has never been accepted in England or in Canada or in a great part of the United States, which I am not certainly advocating.

Then it goes on to discuss the New Hampshire and Durham test which we are proposing here. I will not go into that because I have already summarized it for you. It deals with certain criticisms which have been raised about it.

Then it deals, at page 19, with what is called the Vermont test which is the same test, apparently adopted in the court of Vermont, as the American Law Institute model penal code. It was adopted in the case of *United States versus Freeman*, to which I am about to refer you. The conclusion of the writer of the brief is that criminal law at large, page 20, is under transformation. Several concepts are being reviewed and remain under evaluation.

In this general field the law of insanity deserves particular attention because the solution of the problems it raises needs not only the skill of the lawyer but also the psychiatrist. Fortunately, not all of us share the same philosophy and this makes it difficult to find an ideal solution.

It goes on to quote an expert on the subject, S. Glueck who has written a well-known textbook on the need for the law and the psychiatrist to draw themselves together.

Now, attached to that brief were a number of other documents; it is a bibliography, but I selected three as being particularly helpful. One is chapter XI of a textbook referred to here, *Mental Disability and the Criminal Law* is the title of it. The author's name does not appear on the document submitted. I myself was under the impression that it came from the American restatement on the matter. However, I just want to ask you to note a very few passages in this. At page 331, you will find a statement of the various tests which have been applied. First of all, 11—discusses the M'Naghten rule, the product rule, the model penal code and the Vermont test. You will see them all set out there. I would like to read from page 336. It says on criticism of the existing tests of criminal responsibility.

The question at bar, (i.e., the test for determining responsibility) far from being ordinary, is perhaps the most controversial problem existing in the criminal law today. The problem of articulating a test of criminal responsibility is essentially that of drafting a verbal formula which will enable the judicial process to discriminate effectively between those cases where a punitive-correctional disposition will benefit society, and those in which a medical-custodial disposition is proper. Although a crystal-clear definition of responsibility may be impossible and perhaps undesirable, an operational definition is not out of reach. Any definition of criminal irresponsibility should be consistent with the framework of our penal laws. In other words, such a test should be premised on the rationality of man and retain irrationality as a minimum criterion of insanity. Second, it should harmonize law and modern medical science, thus enabling the psychiatrist to make a maximum contribution unhampered by moral and legal abstractions and oversimplifications.

I will not read the rest, but on the same page, dealing with the M'Naghten test, there is a quotation from what is known as the Gower report, which is a report made by a Royal Commission in England, in 1953, on capital punishment.

Briefly, they have contended that the M'Naghten test is based on an entirely obsolete and misleading conception of the nature of insanity, since insanity does not only, or primarily, affect the cognitive or intellectual faculties, but affects the whole personality of the patient, including both the will and the emotions. An insane person may therefore often know the nature and quality of his act and that it is wrong and forbidden by law, but yet commit it as a result of the mental disease.

The chap Markel was a clear illustration of that, because Markel knew that what he did was wrong and gave himself up, but he had no control over his ability to handle himself under certain conditions. This document goes on to discuss the various tests and I will not hold you up on that, but I would ask you to turn to page 366 of this particular document. It criticizes the various things in detail, but this is the conclusion. It states:

It is desirable to broaden the class of the mentally disabled who are held criminally irresponsible without removing the issue from the jury.

My change of the law of course does not do that. The jury directed by a judge, after hearing the evidence, would still be the people who would decide the matter.

The M'Naghten and irresistible impulse tests define too narrowly the class of persons who should be hospitalized rather than imprisoned for their criminal acts. These tests also prevent psychiatric witnesses from presenting an adequate word picture of the defendant's mental condition because they are phrased in terms having little relevance to current learning in the field of psychology. The product test remedies both of these defects. However, the standard it sets is so vague that the jury has very little to guide it in resolving the conflicting evidence concerning the defendant's mental condition. There is a danger that the jury may rely unduly upon the expert, thus improperly shifting to the expert the jury's traditional responsibility for fact-finding. The Vermont and Model Penal Code test have had such limited practical application thus far that it is impossible to do more than speculate concerning the ability of the test to remedy M'Naghten without creating new pitfalls.

That is the conclusion and I think that is the conclusion of a good many American scholars and you will find, if you have time, that this is very valuable.

I have two more documents I would like to refer you to. One is in French, an extract from the Canadian Psychiatric Association Journal, an article by Dr. Lucien Panaccio and the French speaking members of the Committee will please pardon me if I do not attempt to read this in French, but I would call to your attention this article at page 228 where Dr. Panaccio expresses the opinion that the M'Naghten rules are based on a definition—this is my free translation—too simplistic and extremely limited of mental illness. Then at page 229: "It is ways the case that in a century of discussion and of criticisms on the subject of an excessively rigid arbitrary legal rule, that the M'Naghten rule should one day—that is to say, on July 1, 1954,—be rejected by the Court of Appeal in the District of Columbia in the no less famous case of Durham. The Durham test is much more in harmony with medical and psychiatric thought of our time. The

Durham rules do not seek to define with precision the terms 'mental illness' or 'mental deficiency' although the Hon. Judge Bazelon makes the following distinction as to the duration and origin of the two concepts".

At the bottom of the same column it says that the great advantage of the Durham rules is that they permit the psychiatrist to give evidence in medical fact and not just in moralistic terms. It makes it possible for him to speak the language of his own discipline without dividing the accused into that part where his knowledge is in question and that part where his will is in question. I hope that is a fair translation. Therefore the effect of this article is that this, gentlemen, is medical evidence and there is a whole host of medical evidence to this same effect.

The other document that I have given you is a decision of the United States Court of Appeals, 1966, in a New York case. Once again I will not ask you to look at the whole thing, but I will give you one or two brief references. On page 615, the following is stated:

We are here seeking a proper test of criminal responsibility. That we are not instead deciding the initial question—whether lack of such responsibility, however defined, should be a defense in criminal prosecutions—itself seems significant and worthy of at least some brief comment.

The criminal law, it has been said, is an expression of the moral sense of the community.

And perhaps that is why we in parliament are asked to deal with this.

The fact that the law has, for centuries, regarded certain wrong-doers as improper subjects for punishment is a testament to the extent to which that moral sense has developed. Thus, society has recognized over the years that none of the three asserted purposes of the criminal law—rehabilitation, deterrence and retribution—is satisfied when the truly irresponsible, those who lack substantial capacity to control their actions, are punished.

Then it goes on again to review the M'Naghten case and its background, and at page 618, at the bottom of the first column under (3), the following is stated, and I adopt this as the basis for my argument.

But the principal objection to M'Naghten is not that it was arrived at by this extraordinary process.

That was how they arrived at their decision in court.

Rather, the rule is faulted because it has several serious deficiencies which stem in the main from its narrow scope. Because M'Naghten focuses only on the cognitive aspect of the personality, i.e., the ability to know right from wrong, we are told by eminent medical scholars that it does not permit the jury to identify those who can distinguish between good and evil but who cannot control their behaviour. The result is that instead of being treated at appropriate mental institutions for a sufficiently long period to bring about a cure or sufficient improvement so that the accused may return with relative safety to himself and the community, he is ordinarily sentenced to a prison term as if criminally responsible and then released as a potential recidivist with society at his mercy. To the extent that these individuals continue to be released from prison because of the

narrow scope of M'Naghten, that test poses a serious danger to society's welfare.

I call that to your attention, because it is often thought that those who want a modernization of the rule are solely sentimentally interested in the person who commits the crime rather than the victims of crime. The opposite is partly the case as this passage indicates. Then at page 619, in the second column, it states:

Psychiatrists are not alone in their recognition of the unreality of M'Naghten. As long ago as 1930, Mr. Justice Cardozo observed that "everyone contends that the present definition of insanity has little relation to the truths of mental life." And Mr. Justice Frankfurter, as a witness before the Royal Commission on Capital Punishment, declared with his usual fervor: "I do not see why the rules of law should be arrested at the state of psychological knowledge of the time when they were formulated. I think the M'Naghten Rules are in large measure shams. That is a very strong word, but I think the M'Naghten Rules are very difficult for conscientious people and not difficult enough for people who say, "We'll just juggle them."

The test which they adopted is set out at page 622 and there is discussion of the Durham case. Paragraph 5 is the statement of the test that was adopted by this court and which some of the Committee may think is better than the Durham test adopted in my draft bill. As I have said, I do not mind, as long as the Committee recommends that we get away from the M'Naghten test and adopts either of these tests.

A person is not responsible for criminal conduct if at the time of such conduct as a result of mental disease or defect he lacks substantial capacity either to appreciate the wrongfulness of his conduct or to conform his conduct to the requirements of law.

That may be the test which you people would want to adopt.

MR. GRAFFTEY: Do you consider that a bit narrower than the test you have adopted in your amendment?

MR. BREWIN: It is, but it does give a little more precision to a standard that could be given to a jury. The standard that I have suggested merely implies causation, a causal connection between the mental condition and the act. This defines a little more fully what the presumed connection is, and therefore it is a matter of opinion. If you have a chance to read some of this material, you will see that some experts prefer one and some prefer the other, but they say in this decision that both tests are an infinite improvement over the M'Naghten rules, and that is the point I want to make.

Gentlemen, I think I have taken up a lot of your time; but I think you will find that it is a subject worth your while to look into and study. I hope you will be able to recommend a change in the law. It seems to me that it would be a very useful thing, that Canada would be in the van. In 1953 the English committee recommended it and the American courts have recommended it, and I have a statement here from Judge Bazelon. I mentioned this in *Hansard* when the matter came up first. He wrote the judgment in the Durham case and he said:

In this century the chorus of protest against M'Naghten's rule has become deafening. In a poll taken a few years ago, 80 per cent of 200 American psychiatrists pronounced these rules unsatisfactory.

I would like to quote one other thing. A famous American judge said this:

A society that punishes the sick is not wholly civilized. A society that does not restrain the dangerous madman lacks common sense.

I think that what I propose is consistent with not punishing the sick and therefore advancing in civilization and still restraining the dangerous mad man and thereby treating the matter with requisite common sense.

The CHAIRMAN: Thank you very much, Mr. Brewin. Is it agreed that the article "Criminal Insanity" prepared by the research branch of the Library of Parliament dated November 17, 1966, Chapter Eleven Mental Disability and the Criminal Law, extracted from the Mentally Disabled and the Law—the author of which is not mentioned, but referred to in the first item I have mentioned—the article on M'Naghten versus Durham rules by Dr. Lucien Panaccio which is in French and the report from the United States of America, Charles Freeman, appellant and the United States Court of Appeals Second Circuit, be printed as an appendix to today's proceedings?

Mr. AIKEN: Mr. Chairman, could all these people be called as witnesses?

The CHAIRMAN: That is what I am suggesting, but I would like to have your comments.

Mr. FOREST: Could we not restrict it to what was prepared by the research branch of the Parliamentary Library?

The CHAIRMAN: That is up to the Committee.

Mr. BREWIN: I have furnished the Committee—or the members here at least—with copies of these other documents.

The CHAIRMAN: I am not thinking of the Committee, I am thinking of people who may read today's proceedings and everything could be in one place.

Is it agreed that we print only the one from the Library on their research and that the others be exhibits to today's proceedings?

Mr. HONEY: Before a motion is put, could you advise the Committee on how wide is the distribution of our proceedings. Is this going to law schools and universities?

The CHAIRMAN: Could you tell us?

The CLERK OF THE COMMITTEE: It goes to universities and university libraries and law school libraries. They get this free through the Queen's Printer. There are also many other people who subscribe to this through the Queen's Printer.

Mr. AIKEN: Mr. Chairman, I think the memorandum which was prepared by the research branch could be useful, but the other documents are copies from reports that are available elsewhere, and I sometimes hate to load down our printers, unless it is necessary.

The CHAIRMAN: I knew it was a lot. It is agreed that only the article prepared by the research branch of the Library of Parliament dated November 17, 1966, be printed as an appendix? Is that agreed?

Some hon. MEMBERS: Agreed.

The CHAIRMAN: I see Mr. Tolmie has his hand up to ask a question, but we have Professor Ryan and Professor Beck and it is now 12 o'clock. I wanted to

give these distinguished gentlemen an opportunity to be heard. If there are any questions of Mr. Brewin, I would suggest that you make them as concise and brief as you possibly can.

Mr. AIKEN: Perhaps we could go ahead with the other witnesses and question Mr. Brewin and the witnesses together.

The CHAIRMAN: Is that agreeable to you, Mr. Brewin?

Mr. BREWIN: Yes, but I might say before you go on that Mr. Arthur Martin said that he would be willing to give evidence to this Committee. He is an expert on this and therefore if you did want to hear him, it is possible to arrange it. Perhaps Committee members may want to question me further when they had heard all the other witnesses—not that I am trying to evade cross-examination—but perhaps this would be best.

The CHAIRMAN: What is the thought on that? Would you all like to hear Mr. Martin?

Mr. AIKEN: I think this would be very useful.

The CHAIRMAN: Mr. Brewin, we will leave it to you to arrange for Mr. Martin's appearance.

Without any further remarks by the Chairman, I will call on Professor Ryan to make his statement.

Professor H. S. RYAN (*Faculty of Law, Queen's University*): Mr. Chairman, my colleague Professor Beck and I are honoured by being permitted to address the Committee on this subject and I should say at the beginning, that we are making a joint submission. I will attempt to bring out certain features of the present situation which have been referred to in a mimeographed note, which I understand has been circulated among members of the Committee, and Professor Beck will discuss alternatives to the present rules.

I should say we agree that it is highly desirable that the provisions of the present Section 16 be replaced by another rule, but in our opinion it would be better if the new rule were the rule recommended in the American Law Institute Model Penal Code rather than the Durham rule. This part of our presentation will be dealt with by Professor Beck.

I would like to begin by bringing to the attention of the Committee the fact that not every person who offends, or commits a criminal offence, is mentally ill by any definition of mental illness. Of those who are mentally ill, a very large majority will not be found to be insane by any definition of insanity which is likely to be adopted. In fact, I think it would be improper if all persons who are mentally abnormal and mentally disturbed were found to be insane and free from criminal responsibility. This means—and I will refer to it later—that while we strongly urge that the bill be passed in the amended form which we will recommend, at the same time we would urge the Committee—and we know it is not easy for a Committee such as this to depart from its terms of reference—to consider whether representations should be made to the government that there should be a complete examination of the whole area of the relation between the mentally abnormal person and criminal law. I will deal in some detail with some aspects of this problem in my submission.

I should point out first that mental abnormality affects criminal law and the penal processes in a variety of ways of which the defence of insanity is only one. It is true that a person who is insane, as defined in Section 16, is not criminally responsible for his conduct while he is in that condition. The number of people who are before the courts and found to be insane, either within this definition or within another's is very small. The other definition is that a person who is insane within the meaning of Section 524 of the Criminal Code is not fit to stand trial on a charge of a criminal offence and he cannot be tried while he is in that condition.

There is no definition of insanity in Section 524, but it is a different kind of mental condition as this word is interpreted in the courts from that defined in Section 16. A person may be sane within the meaning of Section 16, at the time he does an act; he may be insane at the time when he is brought to trial, either because he comes within the different definition, or because his condition has changed. Contrarywise, he may have been insane at the time of doing the act within the meaning of Section 16 and sane and fit to stand trial within the meaning of Section 524, when he comes before the court. If you think this is confusing, you are quite right.

The definition of insanity for the purpose of Section 524 is contained in my memorandum and it is substantially that he is unfit to understand the nature of the proceedings, the nature of the charge that is brought against him, and is incapable of properly instructing counsel for his defence. This is quite a different test from the test set out in Section 16.

There is a very specialized condition of mental abnormality, that of a woman who by a willful act or omission kills her newly born child, while the balance of her mind is disturbed—in the words of the statute—as a result of giving birth or lactation following birth. Under Section 204 of the Criminal Code, a woman who kills in this condition—and this refers to killing a child who is under 12 months of age—is guilty not of murder or of manslaughter, but of a special offence called “infanticide”. It is my respectful submission that these unfortunate women should not be charged with and convicted of any offence, but it is better to have them convicted of infanticide than to have them convicted of murder, as was formerly the law.

Mental abnormality of any kind is, of course, relevant to sentence, where a person is criminally responsible, but the court has to determine what to do about it. There is very little in the Code that directly deals with this and this is a most important problem. Section 638 of the Code provides for a suspended sentence and for probation, and a restricted form of suspended sentence or probation, can be imposed under Section 637, a sentence analogous to it. It is not provided for particularly in the Code, but it is a practice that is growing where the offender is found to be mentally abnormal and to require psychiatric treatment, it is made a condition of probation, or of a suspended sentence that he undergo such treatment. However, many persons who are convicted of offences, are sentenced to imprisonment and are found to be mentally abnormal or mentally ill. I may say that my experience in meeting these people began to a limited degree while I was in practice. As Mr. Honey will remember, I had a small amount of criminal experience in practice, but nothing extensive. However, during the past 9 years, while I have been teaching and studying criminal law and criminology, through my association with the John Howard Society and through my access to the

penitentiaries at Kingston, where I have had the opportunity of meeting and having numerous discussions and interviews, not only with members of the staff who are engaged in treating these people, and in particular Dr. George Scott and his psychiatric staff, but also members of the classification staff of these institutions. I have also had an opportunity of meeting a number of the inmates. I have now been able to add to this a limited experience on the Minister's advisory commission on the treatment of offenders of the Department of Reform Institutions. My experience in these fields, and my opportunity of studying the literature on the subject, have led me to conclude that this is an area which should be carefully reexamined in all aspects, and I mention this in passing. I do not wish the Committee to get the idea that I do not think this is an important bill, because I do and Professor Beck agrees with me. We agree that this is a bill that should be passed and we suggest the amended form; but we strongly recommend that the Committee urge that a very careful study be made of the treatment of these people who will be criminally responsible by any definition and most of whom go to prison, and most of whom are in the ordinary prison population.

I can tell you one thing and this will be echoed by every psychiatrist whom you ask and that is that the least favourable surroundings for treatment of these mentally disturbed and mentally abnormal persons, will be the ordinary population and regime of a prison, whether a penitentiary or a reformatory.

We would suggest that the Committee look into the provisions of the United Kingdom Mental Health Act of 1959, which provides for various forms of sentencing to psychiatric treatment of people who are mentally abnormal in one way or another, and are convicted of offences. Time will not permit a full discussion of this, but, if the Committee wishes, we could leave with you some material relating to the act which could be examined by other authorities. I realize that this Committee would not be able to look into it very thoroughly; but we would be very anxious that this type of investigation be favourably regarded by this Committee.

With regard to people who are mentally ill, or may be mentally ill, I should point out there are certain specific provisions in the Code for certain situations. For example, under Section 661, if a person is convicted of certain sexual offences—or one of them—and he is proved in a hearing conducted for the purpose to be what is called a dangerous sexual offender—which is a very broad definition, covering anyone who is likely to commit the offence of indecent exposure among other things—he must be sentenced to preventive detention and this means life imprisonment, subject to the possibility of parole. Many of these people—I say many, but there are not many of them who are convicted—a considerable proportion of those people who are sentenced under this provision, are kept in the ordinary inmate populations of prisons. Others are kept in very strict segregation in conditions which you would think would be inappropriate for caged animals. I think there is one thing that can be said for these people and that is, if anything can be done for them at all, it cannot be effectively done for them in a prison.

Something is being done for narcotic addicts and, as you know, the new institution Matsqui out in the west will take some narcotic addicts from western Canada and one will be introduced here. The main proceedings for the treatment of people who appear to be mentally ill are procedural.

Under sections of the Code, referred to in my memorandum, a person coming before the court who appears to be mentally ill, may be remanded for observation for a period of not more than 30 days. A considerable number of these people are found to be mentally ill and in Ontario, where certified, are kept in mental institutions and may never come before the court. Those of you who have followed the Fawcett case,—which created a great controversy in Ontario and is mentioned on page 4 of my note,—will remember that there was a great deal of dissatisfaction, because Fawcett was never tried on the criminal charge that were brought against him. The fact that people who are certified and thus removed from the frame of the criminal process, are not tried, and it is never determined whether they actually committed the conduct charged against them is a weakness in this proceeding, because the offence may hang over him for the rest of his life. There is no limitation period for most indictable offences in Canada, and unless the charge is disposed of in some form or another, you could in theory be tried at any time as long as you are alive.

I should point out for the members of the Committee also that if a person is found to be unfit for trial by reason of insanity, or to be insane under Section 16 and therefore not criminally responsible, he does not go free. There is a popular misconception that such a person is released in some way. In fact, under the Code, the provisions of which are referred to in my memorandum, such a person must be kept in strict custody and then turned over to the provincial authorities where he is detained during the pleasure of the Lieutenant Governor. In practice, many if not all of these people, are detained in provincial mental hospitals. In Ontario they are nearly all kept in Penetanguishene, which is a maximum security institution and I mean "maximum security". If you ever visit it, you will see why many people think that being sent to Penetang is a fate that is only just not worse than death. There are many offenders and their counsel who would prefer to see a man convicted and sent to prison, rather than sent to Penetang. This is a misconception, because they really are better off in Penetang, but because of the degree of security involved, and also because until recently there was no way of securing release of these people, it was felt that the man would be better off serving a long term than possibly spending the rest of his life rotting away in maximum security.

Recently, a sort of discretionary provision for inquiry by the Chief Justice of Ontario at the request of the Attorney General, has been employed in a number of cases, but no one has a right to have the question of termination of his detention brought up before any tribunal, either in Ontario or in any province. There is some procedure provided in Saskatchewan, but I understand it is not very effective.

Mr. AIKEN: Mr. Chairman, on this point, would a habeas corpus not have been assisted?

Mr. RYAN: No, habeas corpus will not be a release; it has been tried.

Mr. AIKEN: I would like to interject and say that we have another bill before the Committee, which deals with this very subject.

Mr. RYAN: I will not dwell on it, then.

Mr. AIKEN: We also had Dr. Boyd before the Committee from Penetanguishene, who gave very extensive evidence. You are supporting him, and you

evidence is very useful to the Committee, but there is another bill along this very line that you are suggesting.

Mr. RYAN: I would strongly urge that this bill be favourably considered, if it provides for some form of review of detention of people who are held under Section 527, if I remember correctly—as a result of being found to be not guilty by reason of insanity, or to be found to be insane and unfit to stand trial. I will not say any more on that subject right now.

I would strongly support what Mr. Brewin has said with regard to the relevance of the rules set out in Section 16 to the facts of life as they are now understood. In fact, the test is one which cannot realistically be administered. The courts manage to struggle along with it only by, in effect, employing other tests and those psychiatrists who can express their scientific knowledge, in terms of Section 16, do so only at the expense of some distortion of terminology.

There are many psychiatrists who cannot do that, with the result that there are marked differences of opinion among witnesses in trials where the issue of insanity is raised. These differences of opinion do not create a popular belief that the process is reasonable or just. I have a letter here from one psychiatrist who complains very strongly about this procedure. He refers to the case of Matthew Gary Smith, the beatle wig bandit, who was convicted of capital murder following a robbery and murder in Toronto, and who committed suicide afterwards. His psychiatrist had to do with the examination and treatment of Smith in the institution and says he was undoubtedly deeply psychotic, but conflicts of opinion by psychiatrists on the question of whether his psychosis brought him within Section 16, led to his conviction.

I will not attempt to outline in detail the pattern of mental abnormalities existing or recognized by modern science as I have attempted to set out in my memorandum, but you will notice that it extends into three particular fields. One is the field of the psychosis, where the patient is strongly dissociated from reality. Another is the field of epilepsy, where the patient is in the grip of forces which are perhaps electrical or chemical in their nature, which compel him to engage in conduct which is often violent and apparently criminal and intentional and sometimes apparently motivated. Sometimes the actor appears to intend to kill, but in fact he is in a state of automatism, which will pass away.

The third group is the group of people who are not dissociated, but are either neurotic or have distorted personalities, such as the psychopathic personality, or the sexual deviate who are led by very strong propensities and tendencies of the personality which perhaps are resistible, but are not in fact resisted, to commit anti-social conduct again and again. In this last group, these people I do not think will be found insane by any test and yet these are a considerable part of our offenders and of the inmates of our institutions. It is for these people that I suggest we should look into the possibility of legislation such as the mental hospitals act. Acknowledging that, it is extremely difficult to bring a deeply psychotic person, who should be found not criminally responsible, within the existing test.

It is quite clear that it is impossible for a person, for example, to have specific delusions and to be in other respects sane. We are just talking about a condition that never exists in fact. This is clearly the result of what psychiatrists have learned and are teaching us. It is also very rare that you find a person who

is incapable of appreciating the nature and quality of the act, whether according to Chief Justice McRuer's definition, or whether according to a narrower definition—if there is one—or of knowing that the conduct is wrong. The offender very often knows what he is doing is wrong, but he is incapable of conforming his conduct to the requirements of the law in the language of the American Law Institute test and it is for this person that we recommend that the bill be amended.

To repeat what I said at the beginning, in our opinion, the Durham test, if it can be worked—and it is very difficult to get psychiatrists to agree that it can be worked—and properly employed, it would seem to exclude from criminal responsibility some people who, in our opinion, ought to be criminally responsible, but for whom a special punishment or regime should be administered. It is for this reason that Professor Beck and I are not recommending that rule. I think I will bring my remarks to an end. Unless there are some questions members of the Committee may wish to ask, I will now ask Professor Beck to take over.

Mr. MATHER: Mr. Chairman, I understand the witness does not favour the test as suggested in the bill that is before us, although he goes along with the general tendency or idea behind the bill, am I right in understanding that he prefers the American Law Institute test?

Mr. RYAN: Yes.

Mr. MATHER: Would you mind very briefly citing that test.

Mr. RYAN: Professor Beck is going to deal with that.

Mr. MATHER: That is fine.

Mr. RYAN: He will deal with that part of our submission.

Mr. TOLMIE: I do not want to generate a long discussion, but I have one brief question. I think what you said, in effect, is that we should have a change in the rules, but also there is a great number of inmates who are not legally insane but have emotional problems. This is accepted, but what has always bothered me is this one question. We acknowledge the fact that we should have more psychiatrists, not only generally speaking, but those who are interested in criminal law and criminal behaviour. How do we achieve this desirable end of getting more psychiatrists, in the first place—I know this is perhaps out of your field—and getting them interested in criminal behaviour and then getting them interested in going to the prisons to do something about it?

Mr. RYAN: These are all very good practical and important questions. The first question I hope is one that will be solved by the pending extension of an expansion of medical faculties in a number of universities. This is a tremendously expensive and difficult operation, but it is under way. The second problem is one that has been a very real problem, but I think—at any rate, at Queen's—witness an increased interest in the department of psychiatry in the problem of the delinquency in psychiatry. I believe this trend is going to be effective in the near future. Of course, even at that it will take 10 years before you have a very large increase in the number of psychiatrists. At the same time, the policy of increased treatment of mentally ill persons in society, should mean there is more space in provincial mental hospitals.

The Commissioner of Penitentiaries, in his last report, seems to be very pleased with the fact that the number of inmates who are transferred to mental hospitals is going down. It is less than a quarter of what it was some time ago. In my own mind this is not a good thing and that it would be better if we had more inmates being treated in provincial mental hospitals. It might be more expensive, but there the facilities exist, the staff exists; they do not exist adequately in penal institutions.

I do not want in any way to disparage the very devoted work that is being done by the psychiatric staff of penal institutions, but there just are not enough of them to begin with, and also the surroundings and the atmosphere of the penal society are entirely hostile to therapeutic treatment of these people. It would take a whole lecture to discuss the nature of the society of a penitentiary, but it is a very hostile society.

The third question is, of course, to offer them (a) a decent salary and (b) decent conditions to work in. It is possible that the proposed creation of medical psychiatric units in each penitentiary region—one is proposed for Millbrook near Kingston—will provide for both of these conditions. I must say that I strongly support this development in the penitentiary service. I only wish it were given higher priority. First priority is being given to super maximum institutions, which to my mind are bastilles. If they gave first priority perhaps to classification and then to the medical psychiatric units, the result would be more favourable.

Mr. TOLMIE: You suggest a segregation within the penitentiary area?

Mr. RYAN: For many of these people yes, but not in the present form. If you go into a psychiatric ward in a penitentiary today, you would be shocked by the conditions. The staff are not to blame, because they cannot help it.

Mr. TOLMIE: That is the reason I brought the question up. I was down at St. Vincent de Paul and found out they had one part time psychiatrist for about 900 inmates, and I saw the facilities.

Mr. RYAN: About one third of those people probably need psychiatric treatment of one form or another.

The CHAIRMAN: Professor Beck, you may remain seated.

Professor STANLEY BECK (*Queen's University*): Mr. Chairman and gentlemen. Mr. Brewin and my colleague, professor Ryan, have dealt rather fully with the problem and all I really want to do is, in a very brief way, go over the objections to the M'Naghten rule, the alternatives proposed to the Durham rule and why we prefer the A.L.I. tests. As I say, Mr. Brewin has gone over this quite adequately and I would just like to re-emphasize the defect in the M'Naghten rule, which is enacted in Section 16 of the Criminal Code, with one change. Perhaps one important change is that word "no" which was the word used originally in M'Naghten has been changed to the word "appreciate" in section 16. It was that word that former Chief Justice McRuer seized on when his Royal Commission report on insanity he advocated that there had been no change.

To start with M'Naghten, it cannot be emphasized too strongly I think that the M'Naghten rules are a pure accident of history. It is not generally known, at least at the trial itself of Daniel M'Naghten, the work of Dr. Isaac Ray, who was

one of the earliest psychiatrists in the United States, on medical jurisprudence which was and is a classic, was quoted to the jury by Chief Justice Turdal. Dr. Ray's book contained the most enlightened views, at the time, on the subject of mental illness and criminal responsibility. He particularly criticized the right-wrong test. New, the right-wrong test really derived from the so-called wild beast test, of the 15th century.

The law has always been disturbed, before there was any knowledge of mental illness, as we know it today, about the problem of excusing from responsibility those who to the layman's eye, clearly cannot help their conduct and who ought not to be held responsible for their conduct. As a result, the law came up with such a crude test that the defendant would be excused if he did not know what he was doing, no more than a wild beast. In the 18th century, the so-called wild beast test was changed to the right-wrong test. That was the state of the law at the time of M'Naghten's trial. At the trial, Dr. Ray's work was quoted by Chief Justice Turdal and the jury was told that the human mind is not compartmentalized and that a defect in one aspect of the personality could spill over and affect other areas which medical science knows to be the fact today. That is, you cannot abstract out of the total personality one element, the cognitive element, that is the ability to know right from wrong. The human mind just does not work that way. You cannot abstract out emotion, will and effect in that way. The total personality is affected by any kind of mental illness. You cannot divide the mind up into five or six areas and say the fourth area is affected, but the first, second, fifth and sixth are not. That is just a fictitious view of the human mind and yet that is what the right-wrong test required. Dr. Ray called the knowledge of right and wrong a fallacious test of criminal responsibility; therefore, Daniel M'Naghten was acquitted, by reason of insanity.

As you know, because of the political overtones of the attempted assassination of Sir Robert Peel, a great human cry arose at the time and Queen Victoria herself was involved and as a result the House of Lords summoned the judges to take their opinion on what the test should be in regard to the law of insanity. Interestingly enough, Chief Justice Turdal, who presided at M'Naghten's trial, also presided at the hearing at which judges gave their opinion and in giving their opinion, in face of the political pressure of the time, they abandoned the test that had been applied at M'Naghten's trial and reverted to the right-wrong test, the so-called M'Naghten rules. Therefore, the M'Naghten rules did not arise from Daniel M'Naghten's trial; but they arose from the opinion of the judges that was taken by the House of Lords after the Queen herself had intervened in the face, if you like, of the pressure of the time. At the time when medical science and the science of psychiatry was beginning to develop and just at a time when Dr. Ray's work was first used by the English courts, the accident of history turned it around and they reverted to the 15th century right-wrong test, which has no basis in reality at all.

To come right up to the present day, the English Royal Commission on Capital Punishment considered the matter in its review. The review lasted for four years, 1949 to 1953 and they articulated the basic defects of the M'Naghten rules. They said:

They are not in harmony with modern medical science which, as we have seen, is reluctant to divide the mind into separate compartments—the intellect, the emotions and the will—but looks at it as a whole

and considers that insanity distorts and impairs the actions of the mind as a whole.

Most importantly, the Royal Commission pointed out that if a criminal offender, who had been acquitted on the ground of insanity, did not know right from wrong, you would not be able to run a mental institution. If a man could not pay attention to the commands of those who were in charge of the institution it would be impossible to run it. They can verbalize; they can say "this is right and this is wrong". They can obey orders, but the point is that they have no appreciation of reality, as we understand it. They are not able to make a rational choice among a set of alternatives which they appreciate. Because you can tell a person in a mental institution if he does thus and so, he shall be punished or shall miss a meal and he does it, that does not in any way indicate that if you let him out in society he will be able to conform to the rules of society.

The right-wrong test is wholly fictitious and has no relation to the reality of the situation at all. They do know, in a general way, that their act is wrong, and the Royal Commission cited many examples. Take the case of a person who is schizophrenic who is suffering from a melancholy, a deep state of melancholy, and in that state will murder one of his children. That person can sound like the most rational person in the world to you, if you talked to him, he would say, yes, he knew it was wrong and knew it was against the law. Clearly the person is a psychotic; he has no appreciation of his conduct and that is really what matters.

We now come to the Durham test and the court in Durham, after a review going right back before M'Naghten, pointed out all these defects and quoted at length from the English Royal Commission. They also made the point, not only that the right-wrong test is fictitious, but it is wrong to base the test on any one symptom at all. No test of criminal irresponsibility in terms of insanity, should be based on any one symptom, it is just not the right-wrong test is the wrong symptom, it is that the test should not be based on any symptom. You must look at the mind as a whole and the individual as a whole. You must not abstract out of the personality one particular aspect of it.

Then the court laid down the Durham test; an accused is not criminally responsible if his unlawful act was a product of mental disease or mental defect. Therefore, the psychiatrist at that time would be able to testify, unhampered by any artificial concepts as to right and wrong and the jury would then be able to decide on the basis of all the evidence—whether or not the accused should be held criminally responsible. In other words, they would, on the basis of the evidence, answer the question: Was the unlawful act a product of mental disease or mental defect? There has been a great deal of debate about the Durham rule ever since, and certainly it has the merits of doing away with the fictitious test of M'Naghten. However, it has been criticized on a number of grounds.

The first ground is it is said that the Durham test takes the essential question away from the jury and it does so in this fashion. If you put a psychiatrist on the stand and he testifies as to the mental condition of the offender, and then you ask the psychiatrist, was the act a product of mental disease or of a mental defect and he answers "yes" to that question, then for all intents and purposes you have taken the question away from the jury. You have made the psychiatrist the finder of fact, rather than the jury. The jury in our system—and I think it must be this way—are the ones who answer the essential question as to the criminal responsibility or not.

Another objection to the Durham test is the idea of mental disease. Mental disease itself is an uncertain concept; uncertain, not in the sense that psychiatrists will disagree about any basic diagnosis, but uncertain in the sense that psychiatrists themselves do not agree on what constitutes mental disease, particularly over states of psychopathy. Some psychiatrists will say that a psychopath is suffering from a mental disease and other psychiatrists will say he is not; therefore, it is that kind of disagreement in which there is no accepted definition among psychiatrists themselves of the term "mental disease" which makes it a dangerously vague term to be a critical part of a rule of law on criminal responsibility.

The third criticism of Durham is the term "product" is in itself inadequate. The idea of the conduct being the product of mental disease repeats, in a way, the error of M'Naghten. That is, behaviour and mental illness are inseparable and you cannot say that the behaviour is a product. You have to look at the personality as a whole, and behaviour and disease are really two sides of the same coin, and it is very difficult to draw the product test. If it was a but for test; in other words, if he had not committed the act but for, then you can almost never give a negative answer, because of the unity of the personality, which is essential to modern psychiatry. It was for these reasons that the American Law Institute—and I think I should just take a moment to say what the American Law Institute is.

It is an organization composed of judges, practitioners, law professors and those whom they second to the institute, depending on the study they are doing. They are doing some of the most advanced work, not only in criminal law, but in all areas of the law in the United States and they draft model codes. Their most successful so far, I suppose, being their model corporations act and now we have the model penal code, which is a result of 10 years work by the leading men in this field and the leading doctors in this field in the United States. After some consideration they rejected the Durham test and they made particular reference to the ambiguity that is inherent in the term "product". If "product"—and I am now quoting the American Law Institute:

If product is interpreted to call for a standard of causality less relaxed than but—for cause, there are but two alternatives to be considered:

- (1) a mode of causality involving total incapacity, or
- (2) a mode of causality which involves substantial incapacity. But in either of these causal concepts is intended, the formulation ought to set it forth.

It is that formulation that is set forth in the American Law Institute's draft. The American Law Institute test is this:

1. A person is not responsible for criminal conduct if at the time of such conduct as a result of mental disease or defect he lacks substantial capacity—

Now, you see it is not total incapacity, because even the most serious schizophrenic will not be wholly divorced from reality and you cannot put this thing in terms of black and white, in terms of right and wrong. The test is one of substantial capacity either to appreciate the wrongfulness of his conduct, or to conform his conduct to the requirements of the law.

The heart of this really is the lacking of the substantial capacity either to appreciate the wrongfulness of his conduct or to conform his conduct to the requirements of the law. This test, as you see, leaves a psychiatrist free to testify as to what, in his opinion, is the mental state of the offender at the time he committed the offence. The question then is left to the jury. On the basis of all the evidence, did the accused lack a substantial capacity to conform his conduct to the requirements of the law. Therefore, the essential question is left to the jury and the psychiatrist is not hampered by artificial rules. Again, it is important to emphasize that such a verdict does not mean that the accused is set free, but rather he is confined to a mental institution.

As Mr. Brewin has told you, the United States Court of Appeals for the Second Circuit which I may say is the most influential and respected Circuit Court of Appeals in the United States just last year adopted the A.L.I. test for the Second Circuit. The state of Vermont, with some modification, has adopted the A.L.I. test in its statutes and the Courts of Appeal for the Third and Tenth Circuits in the United States have also—with minor change in wording—reformulated the M'Naghten rules in terms of the American Law Institute's test. What we support basically is the American Law Institute test.

I should say, to come back to Durham, is that the Durham rule itself would be a vast improvement on M'Naghten and Professor Ryan and I, do not, I would suggest, strenuously object to Durham; it is just that we think the A.L.I. test is better. The important point is that Section 16 should be changed. Section 16 enacts in a Criminal Code that we use in 1966, a 15th century test of mental state and of criminal responsibility that has no basis in reality, and it just ought not to be used in the administration of criminal justice. A psychiatrist ought not to be faced with that kind of question, whether a man knows right from wrong. In the first place it is not the kind of question that you can give an answer to, because he does not know. There is just no way of measuring in psychiatric terms whether the man knew right from wrong. He must give his evidence in terms of the man's mental condition.

The important thing then is that Section 16 be altered. Just in brief conclusion, I would like to support what Professor Ryan said in terms of the Criminal Code and say the whole Code needs looking at, but nonetheless the whole relation of mental illness to criminal responsibility ought to be investigated, because there are many people who are now convicted of crimes and sent to prison, who ought to be treated for the particular mental illness that they are clearly suffering from, and a prison is no place for them. In fact, in the penitentiary system you have a recidivism rate of about 60 or 65 per cent, attesting to that fact that these people ought to be treated in proper hospitals.

We would urge the Committee to look at the English Mental Health Act of 1959. This is a far broader question than Section 16. Section 16 is unfortunately inextricably bound up with capital punishment and is used primarily in capital cases in Canada, because both counsel and defence will take their chances with the mental hospital rather than with the possibility of capital punishment; whereas the test of mental capacity ought to be used in a whole variety of lesser offences for which people ought to be treated.

I might point out that Durham, for instance, was convicted of house breaking; this was his offence. Freeman, in the Second Circuit case which adopted the A.L.I. rule, was himself a narcotics addict, so there are a whole variety of

offences for which the test of mental irresponsibility ought to be used, rather than just in the capital cases, which is not the case in more than 90 per cent of the cases in which Section 16 is invoked. The Mental Health Act of 1959, of England, ought to be looked at in relation to criminal law in this country. That is all I have to say.

The CHAIRMAN: Thank you very much, Mr. Beck.

We have two papers here. Mental Abnormality and the Criminal Law, the Present Situation, which were commented on by Professor Ryan and then we have the alternative to the M'Naghten rules commented on by Professor Beck. I would take it that the two of them constitute the brief of Professor Ryan and Professor Beck and I was wondering if the Committee agrees whether they should be printed as appendices to today's proceedings?

Some hon. MEMBERS: Agreed.

The CHAIRMAN: The meeting is now open for questions.

Mr. RYAN: I would like to ask Professor Beck how he distinguishes the Durham test from the A.L.I. test with respect to the psychiatrist as an expert witness giving his opinion, and taking the decision away from the jury. In the A.L.I. test is it still not possible for counsel to ask the expert psychiatrist whether in his opinion there is substantial incapacity?

Mr. BECK: Yes; there is no doubt about that. A psychiatrist, by defence counsel, is always going to be asked that sort of question, but I think that is a danger you are going to have regardless of the type of insanity test that you have. For instance, under Section 16 at the present time, counsel would ask: Did he have the capacity of knowing right from wrong, did he know right from wrong? He will try and get the psychiatrist to answer the question in terms of the test he formulates. I do not think there is any getting away from that. What the A.L.I. test does is broaden it somewhat, so that kind of question would not be asked, but that rather the total mental condition of the individual would be brought out. I do not think there is any escaping that difficulty. Counsel will always formulate his questions to the psychiatrist in terms of the test you lay down.

Mr. RYAN: I should think that would be his main object, if either test—

Mr. BECK: Yes, I think so.

Mr. RYAN: That would be his main object—

Mr. BECK: Except that very few psychiatrists will give counsel that kind of a black and white answer; they will give a much broader answer. Indeed, very few psychiatrists, if any, will give an answer to the right and wrong question. They will always rephrase their answer in terms of capacity to appreciate the act.

Mr. RYAN: Would it not be easier for a psychiatrist to say that in his opinion it was a product than it would be to say that it was a substantial incapacity?

Mr. BECK: Well, if he says it is a product that is the sole question, but whether he lacks substantial capacity to appreciate the wrongfulness of his conduct is more a matter of opinion, given his whole mental condition; it is just somewhat broader. It would not be a black and white answer to is the act product of the disease.

Mr. H. S. RYAN: I have some comments by psychiatrists that might be relevant.

Mr. RYAN: I would like to hear them, because this rubber stamping by the jury of a psychiatrist's opinion is—

Mr. H. S. RYAN: These are not directly relevant to your question, but they are in a way. Dr. Boyd, who has been referred to, is the superintendent of the Ontario Hospital at Penetang. He is not thoroughly happy with either the Durham rule or the A.L.I. rule. He is far from happy with the present provisions of Section 16, even as interpreted rather broadly by the McRuer report. In regard to the Durham rule, he says:

I do not know whether the accused should be excused if mental illness has played any part in the criminal offence, but whether the unlawful act needs to be entirely the product of mental disease or mental defect.

With regard to the A.L.I. rule he feels uneasy about the last phrase: "to conform his conduct to the requirements of the law. He says:

I am afraid with our present state of knowledge we can rarely state whether a patient could not, or merely has not, conformed his conduct to the requirements of the law.

Dr. R. J. McCaldon, who is in practice in Kingston and was for a time an associate of the forensic clinic in Toronto and has also been associated with Dr. Scott in the psychiatric work in the penitentiaries; says:

In my mind the Durham rule could be interpreted so liberally that the whole concept of individual responsibility would be lost to justice.

Mr. RYAN: This is a weakness—

Mr. H. S. RYAN: He does not comment on the other rule. He says:

If I understand the spirit of the law in this matter it is that no person who commits a crime as a result of a psychosis; that is, a mental illness so severe that the individual loses touch with some significant aspects of reality, should be held responsible. As you know, the present ruling does moderately effectively designate as insane those people who are suffering from psychosis. Is there not some rule which could be formulated which would effectively designate the people suffering from a psychosis and yet leave responsible, people who are psychoneurotic, sociopathic, or have other personality problems?

Mr. RYAN: Is the very fact a criminal charge is laid against a suspect not going to arouse in the minds of even a psychiatrist some suspicion of a possible mental disease, and prejudice him somewhat in his approach?

Mr. H. S. RYAN: Yes, I know; we all want to give the explanation which is appropriate to our discipline, that is right. But I think you will find that psychiatrists are quite responsible about this. In particular, there has been a great outcry among American psychiatrists to the effects that they do not know how to say whether conduct is the product of mental disease and they are afraid; if the issue is raised, as Professor Beck has said, there is no way of demonstrating that it is not the product of mental disease. Once you prove

mental disease or defect, there is only one answer possible, as far as they know. Dr. Boyd suggested the same thing indirectly.

Mr. RYAN: There is still lots of room, I suppose, for psychiatrists to differ, in any event, no matter which test is used?

Mr. BECK: That is right. There will always be more than one psychiatrist testifying. It is only in severe cases, even if you broaden the rule, in which insanity will be invoked as a defence by defence counsel. There is very little, if any danger, of lessening the bounds of criminal responsibility in this area.

The CHAIRMAN: Gentlemen, it is now 1 o'clock. Mr. Ryan may have some more questions, Mr. Aiken has a question or two and I know Mr. Grafftey has, so I would suggest that we get on as quickly as possible. Perhaps Mr. Brewin will have some comment at the closing about some of the questions.

Mr. BREWIN: I would like to make a one sentence comment.

The CHAIRMAN: I do not want to forgo anyone, but I just want to point out that it is one o'clock and this has been a long, but very interesting session.

Mr. RYAN: I will pass.

Mr. AIKEN: I have one question, Mr. Chairman. The American Law Institute test would substitute a wording something of this nature, that a person lacks substantial capacity to appreciate the wrongfulness of his conduct, or to conform his conduct to the requirements of the law. I cannot see very much difference between that and the right-wrong test. Have we gone around the complete circle? This is just a fancy wording of the same thing.

Mr. BECK: I do not think so. The difficulty with the right-wrong test is that a seriously disordered accused will be able to verbalize the answer to that kind of question, to say whether he knew it was right or whether it was wrong; whereas the A.L.I. test talks about substantial capacity to appreciate the wrongfulness of the conduct. I think there is necessarily inherent in that an appreciation of consequences, and appreciate means to truly understand the choice you are making and the effect of your actions, and in that sense looking at the mind as a whole, or to conform conduct to the requirements of the laws and therefore taking account of a variety of impulses, irresistible or—

Mr. H. S. RYAN: I think the substantial difference is in that last phrase. First, of all, there is the substantial incapacity, which is not a black and white distinction, and then the incapacity to conform conduct to the requirements of the law, which may exist even though the person is capable of appreciating the wrongfulness of the conduct.

Mr. AIKEN: Would it be fair to say that the A.L.I. test is not a reversal of the right-wrong test, but rather a refinement of it to meet modern understanding of the mind?

Mr. H. S. RYAN: It is not a complete abandonment of the right-wrong test.

Mr. BECK: It is a broadening of it to meet the realities of medical science.

Mr. GRAFFTEY: Following on Mr. Aiken's and Mr. Ryan's line of questioning, I think we all tend to listen to the witnesses and then put the definitions into our own language, and I want to make certain that my idea is correct. By adopting such an amendment, based on the A.L.I. test, would it be correct to state that in

fact we are broadening the notion and the concept of the *mens rea*, to the effect that in some cases intent becomes immaterial. We could go on and say that the man intended to kill, but could not help himself anyway.

Mr. H. S. RYAN: I think so. I think there is a danger. I always advise my students to avoid the use of the phrase "*mens rea*", because it is a phrase that causes confusion in the minds of many people. There is a danger in using that phrase anyway, but I think in principle what you say is right.

Mr. BECK: Not necessarily that that person might not be acquitted under the present test.

Mr. GRAFFTEY: My criminal law was the *mens rea*, the forming of the intent to kill, and now we are broadening this concept, are we not?

Mr. BECK: That is right. Let us say a person is suffering from melancholia, or a person is under the delusion that he is commanded to kill someone his acts are purposive in the sense that he will tell you that he intended to kill or he was commanded to kill. He is clearly a psychotic.

Mr. HONEY: Mr. Chairman, I have one or two questions. I want to say to the Committee that I am one of Professor Ryan's students, not in a formal sense, but I have learned many things from him across the counsel table in the years we practised in the same locality, and I am very pleased he is here with Professor Beck today. I just wondered, Mr. Aiken mentioned this on the A.L.I. test, would it be fair, and am I stating it correctly, that it is really a broadening of the generalization of the Durham concept? Take the first factor, the substantial capacity. Will that in effect encourage the courts to create a field of jurisprudence in interpreting, and give them some space to move out into, that the Durham test would not give them in interpreting, particularly, substantial capacity?

Mr. BECK: It is a jury question and it will almost always be a question for them. I think it gives them a little more elbow room. If you mean will more people fit within the test, or more people be found not guilty, by reason of insanity and committed to an institution, I do not know that that would be the case. I would not be prepared to say that more people will come within the test than come within the present Section 16, although I think they will. That really is not the heart of the matter. I certainly think it will give more elbow room both to the psychiatrist and the jury.

Mr. HONEY: It just seemed to me that it would probably give more elbow room than in the Durham test, which seems to be more specific. It might give the jury a better opportunity to give some meaning to the evidence of psychiatrists.

Mr. H. S. RYAN: We would hope so.

The CHAIRMAN: Are there any other questions?

Mr. FOREST: May I ask the sponsor if he agrees that the A.L.I. test would be an improvement over the Durham test?

Mr. BREWIN: Originally I said,—and I will stick to this—that I would be perfectly happy to see either test adopted. I do not find criticisms of the Durham test as compelling as do the two professors, for the simple reason that it seems to me that the criticism that it leaves, takes from the jury a thing that has already

been successfully demolished. I think "product of" implies a causal connection and leaves a very broad question to the jury, but it enables the psychiatrist to give the evidence about the mental state of the person and the jury to make a common sense decision.

I think some of the criticisms of the Durham rule are refinements, but the point I would like to make is that I do not think the fact that there is difficulty in finding a perfectly satisfactory test, which there obviously is,—the Durham test is not perfect, the A.L.I. test is not perfect,—should prevent us as legislators from meeting the challenge of getting rid of the Section 16 test, the M'Naghten test, which nearly everyone agrees is outdated and wrong. If the Committee, in its wisdom, were to recommend the A.L.I. test, or some variation of it, rather than the Durham test, then certainly my objective in introducing the bill would be fully met.

The CHAIRMAN: I would like to thank Mr. Brewin, Professor Ryan, and Professor Beck for your attendance here today and particularly for the very interesting information which you have supplied us with. Since many of us are lawyers, we are quite familiar with the M'Naghten rules. We do not have to practice too often with them, but it is a very interesting subject and it shows the development of the law and we do appreciate most sincerely your attendance here today. Thank you very much.

November 17, 1966.

CRIMINAL INSANITY

(FROM M'NAGHTEN TO DURHAM)

(October 19, November 17, 1966)

The principle which governs competence to stand trial is simple. A person accused of crime is mentally fit to stand trial only if he understands the charges against him according to morality and the law. Apparently simple for the layman, the problem of criminal responsibility is one on which lawyers and psychiatrists, while they agree sometimes, are very often in conflict. Therefore it is of interest to study the law of insanity in various countries on a comparative basis. As a matter of fact, in spite of their common origin the laws of insanity have evolved somewhat differently in Great Britain, in the United States and in Canada. The criminal law of England should not be confused with the Canadian criminal law. Although the rules established by the courts in England have formed a historical background to the Canadian law, which is statutory, the jurisprudence founded on them in England does not constitute the Canadian law.

Consequently this paper will be divided into two parts; the first part will be a short historical background and the second will deal with the rules which govern the law of insanity. Comparison will be made between the different systems.

PART I—HISTORICAL BACKGROUND

Legal criteria of responsibility have been defined by the common law and set out in authoritative form in the "M'Naghten Rules" formulated by the judges in England.

In 1843 Daniel M'Naghten was tried in London for the wilful murder of Mr. Edward Drummond, the private Secretary to Sir Robert Peel, the Prime Minister. M'Naghten's history showed that for many years he had suffered from delusions of persecution and hallucinations as a result of which he had visited various countries in an attempt to escape from his persecutors. His complaints to his parents and to public authorities being unavailing, he became embittered, and with the object of drawing attention to his case, and of righting his supposed wrongs, he devised a plan to kill Sir Robert Peel. He watched for his intended victim and when he thought he saw his opportunity he shot Mr. Drummond under the mistaken belief that he was shooting Sir Robert Peel. It was clear during the trial that M'Naghten still thought he had shot the Prime Minister.

The Lord Justice Tindal at the end of the testimony and argument advised that the case be stopped".

"Are you satisfied that at the time the act was committed . . . that he had that competent use of his understanding as that he knew that he was doing by the very act itself, a wicked and a wrong thing? If he was not

sensible at the time that he committed that act, that it was a violation of law of God or of man, undoubtedly he was not responsible for that act, or liable to any punishment that ever flowing from the act . . . The whole of the medical evidence is on one side . . . and there is no part of it which leaves any doubt on the mind . . . If on balancing the evidence in your minds, you think the prisoner capable of distinguishing between right and wrong, then he was a responsible agent and liable to all the penalties the law imposes . . . If not so then you will probably not take upon yourselves to find the prisoner guilty. If that is your opinion then you will acquit the prisoner". The jury rendered a verdict of not guilty, on the ground of insanity.

The verdict created a great sensation and much controversy ensued. A few days after the trial the case was debated in the House of Lords. As a result the House of Lords put certain specific questions to the judges in the hope that the position might be clarified.

The answers to these questions are called the M'Naghten Rules to which we will later revert in detail.

For now it is enough to recall the general principle arising out of the M'Naghten case under which "it must be clearly proved that at the time of committing the act the accused was laboring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing or if he did know it, that he did not know that what he was doing was wrong".

Medical and legal controversy continues with regard to the applicability of the M'Naghten Rules.

On July 1, 1893, the first codification of the criminal law was published in Canada and Section 11 was based on the M'Naghten Rules. But in the Canadian codification (1892) the words of the M'Naghten Rules were changed in three respects.

- (1) In subsection (1) the word "appreciate" was substituted in the first test for "know"
- (2) the word "and" was substituted for the word "or" between the two tests
- (3) in subsection (3) the word "clearly" was omitted before the word "proved".

If the wording of the new codified section were given its ordinary meaning the result would have been to broaden the first test, to make the task of the defence more difficult by requiring the defendant to qualify under both tests and to lessen the burden of proof on the defendant to a limited extent.

Provisions included in section 11 of the Canadian Criminal Code of 1892 were repeated by section 19 of the edition of 1927. The revision of the Canadian Criminal Code which came into force on April 1, 1955, made certain changes in the former section 19. But it does not seem that they were made to change the law.

¹ See Dr. R. E. Turner "Some thoughts on the M'Naghten Rules", Potsdam, New York, U.S.A. (R. A. 1151 T.875).

Of course the M'Naghten rules applied in the United States which inherited the common law. But the scope of the measure of irresponsibility differs according to the states and the jurisdictions.

Certain courts have made an attempt to promote clarification of the M'Naghten tests.

As early as 1871 the New Hampshire Supreme Court rejected the M'Naghten Rules as inadequate, stating that "the verdict should be "not guilty by reason of insanity" if the killing was the offspring of a product of mental disease in the defendant...".¹

Later the "irresistible impulse" test was recognized by the Ohio court² in addition to the M'Naghten Rules and it received a more definite form in subsequent decisions in other states³.

And in 1954 the United States Court of Appeals for the District of Columbia in *Durham v. U.S.*⁴ made an attempt to release the law from its outdated tests.

Durham had a long and varied record of imprisonments for thefts as well as commitments and treatments for mental illnesses, including discharge from the Navy because he was found to be suffering from a "profound personality disorder".

After attempted suicide, he had been transferred to the government hospital for the mentally ill. Discharged and later readmitted to the hospital, he was finally diagnosed as "without mental disorder". Upon discharge following the readmission, he was arrested and tried for housebreaking.

Durham waived trial by jury. The trial judge rejected his defence on insanity and Durham was convicted.

After reviewing the testimony of the psychiatric witness and of the defendant's mother, the Court of Appeals reversed the conviction, and enunciated the radical changes for the future which are the heart of the Durham decision; namely that the rule to be applied on the retrial of Durham and thereafter is simply, that an accused is not criminally responsible if his unlawful act was the product of mental disease or mental defect⁵.

The Durham test was similar to that adopted in 1871 by the New Hampshire Supreme Court.

After having briefly recalled the main cases in their chronological order, let us now appreciate their effects on the law of insanity.

PART II

The defence on the ground of insanity involves different factors which are regarded differently by the M'Naghten Rules and by the Canadian Criminal Law though several similarities can be noted. The rules stated in the Durham case show greater differences. So we will examine the main rules and we will show how they differ.

¹ *State v. Jones* 50 N.H. 369, 398, 9 Am. Rep. 242, 264 (1871).

² *State v. Thompson, Wright's Ohio Rep.* 617 (1834) *Clark v. State* 12 Ohio Rep. 483 (1843).

³ *Blackburn v. State* 23 Ohio 146 (1872).

⁴ *Commonwealth v. Rogers* 68 Mass. 500 (1844).

⁵ *Commonwealth v. Mosler* 4 Pa 264 (1846), *State v. Felter* 25 Iowa 67 (1868).

⁶ *Durham v. U.S.A.* 214 F 2d 862, 874, 875 (D.C. Cir. 1954).

⁷ *Durham v. U.S.A.* 214 F. 2d 862, 870 (D.C. Cir. 1954).

M'NAGHTEN RULES

1. *The nature and the quality of his act*

Under the M'Naghten rules an accused person must be acquitted if, because of a disease of the mind "he did not know the nature and the quality of his act".

The phrase "nature and quality of his act" refers, as it has been held in England, to the physical nature and quality of the act and not to its moral or legal quality¹

"A kills B under an insane delusion that he is breaking a jar"

"the madman who cut a woman's throat under the idea that he was cutting a loaf of bread"².

Of course, a man who was under such a delusion as these, altogether apart from insanity, could never be convicted of murder, simply because he has no "mens rea" (manslaughter, however, might be another matter). The important practical difference is that, if the delusion arose from a disease of the mind, he would be liable to be indefinitely detained in a special hospital, whereas if it arose from some other cause, he would go entirely free.

What is a "disease of the mind" is, then, an important as well as a difficult question which has given rise to some decisions that are not easy to reconcile.

In 1955 it was decided that a physical disorder was not a "disease of the mind" and a man was not found insane because the trouble was caused by a cerebral tumour³.

Two years later Judge Devlin made an applicable distinction.

D. made an entirely motiveless attack on his wife with a hammer. He was charged with causing grievous bodily harm to her with intent to murder her. It appeared that he suffered from arteriosclerosis which caused a congestion of blood in his brain. As a result he suffered a temporary lapse of consciousness during which he made the attack. He suffered from a defect of reason that arose not from any mental disease but from a purely physical one.

Judge Devlin held that D. was suffering from a disease of the mind.

"The law is not concerned with the brain but with the mind, in the sense that 'mind' is ordinarily used, the mental faculties of reason, memory and understanding. If one reads for 'disease of the mind', 'disease of the brain', it would follow that in many cases pleas of insanity would not be established because it could not be proved that the brain had been affected in any way, either by degeneration of the cells or in any other way. In my judgment the condition of the brain is irrelevant and so is the question of whether the condition of the mind is curable or incurable, transitory or permanent"⁴.

2. *Knowledge that the act is wrong*

Then there is the question of whether "wrong" means "legal" or "moral" wrong. Did the accused know that what he was doing was contrary to law, or did he know that it was contrary to the moral law?

¹ Godere (1916) 12 Cr. App. Rep. 21.

² See J. C. Smith and Brian Hogan "Criminal Law"—Butterworths—London (1955) p. 103.

³ (1955) 1 All. E. R. at p. 362.

⁴ (1957) J Q B at p. 407; (1956) 3 All E. R. at p. 253.

The English Court of Criminal Appeal held in *R v. Windle*¹ that the word "wrong" means legally "wrong"

"Courts of law can only distinguish between that which is in accordance with the law and that which is contrary to law—The law cannot embark on the question and it would be an unfortunate thing if it were left to juries to consider whether some particular act was morally right or wrong. The test must be whether it is contrary to law—

In the opinion of the court there is no doubt that in the *M'Naghten Rules* 'wrong' means contrary to law and not 'wrong' according to the opinion of one man or of a number of people on the question whether a particular act might or might not be justified".

It is to be noted that the High Court of Australia has refused to follow this case and has held that "wrong" means "morally" wrong².

The right-and-wrong formula of the *M'Naghten Rules* has been the object of several criticisms because they are based upon an invalid theory which is far removed from modern psychiatric knowledge.

In 1953, Mr. Justice Franckfurter, in his testimony before representatives of the Royal Commission on Capital Punishment, criticized them in these words:

"To have rules which cannot rationally be justified except by a process of interpretation which distorts and often practically nullifies them, and to say the corrective process comes by having the Governor of a State charged with the responsibility of deciding when the consequences of the rule should not be enforced is not a desirable system—(the rules) are in large measure abandoned in practice, and therefore I think the *M'Naghten Rules* are in large measure shams. That is a strong word, but I think the *M'Naghten Rules* are very difficult for conscientious people and not difficult enough for people who say 'We'll just juggle them'³.

In his book "Law and Psychiatry", Sheldon Glueck wrote: "But apart from its illusory precision, and from the question long ago raised by that acute commentator on the English law, Sir James Stephen, about the questionable legal authoritativeness of the very influential advisory opinion of the English judges, there are weaknesses in it which have become ever more evident as with British and American trial and appellate courts have attempted to apply it. Among these the most devastating is the psychiatric: The various versions of the *M'Naghten* 'knowledge tests' unscientifically abstract out of the total personality, but one of its elements, the cognitive capacity, which in this age of dynamic psychiatry and recognition of the influence of unconscious motivation has been found to be not the most significant mental influence in conduct and its disorders. *M'Naghten* proceeds upon such questionable assumptions of an outworn era in mental medicine as that lack of knowledge of the 'nature or quality' of an act, incapacity to 'know right from wrong' is the exclusive or most important symptom of mental disorder; that such knowledge (even if one ignores the view of modern psychiatry of the role of unconscious motivation of acts) is the sole investigator and guide of conduct or, at least, the most important element in

¹ (1952) 36 Cr. App. R.85.

² *Stapleton v. The Queen* (1952) A.L.R. 929 86. C.L.R. 358.

³ See Sheldon Glueck "Law and Psychiatry". Cold War or Entente Cordiale? P. 46. The Johns Hopkins Press (Baltimore 1952) RA 1151 G.48.

conduct, so that only its absence should justly be the criterion of irresponsibility; and that capacity to assess the nature and quality of an act and its rightness or wrongness can be intact and can function as in the case of the average reasonable man, even though a defendant be otherwise demonstrably of disordered mind.

Not only is the famous test vague and uncertain, and not only does it embalm outworn medical notions, but even from the point of view of assumedly separate, insulated mental functions it is also too narrow a measure of irresponsibility. It does not take account of those disorders that manifest themselves largely in disturbances of the impulsive and affective aspects of mental life".¹

It is recognized by psychiatrists that a man may know the nature and quality of an act, may even know that it is wrong, and yet perform it under an impulse that is almost or quite uncontrollable.

In England law does not recognize the test of irresistible impulse, and the M'Naghten Rules remain unaltered². However irresistible impulse has been admitted into the law through the new defence of diminished responsibility.

CANADIAN SYSTEM

The Canadian law with respect to the defence of insanity is, as noted before, embodied in section 16 of the Criminal Code which provides:

- 16 (1) "No person shall be convicted of an offence in respect of an act or omission on his part while he was insane.
- (2) For the purposes of this section a person is insane when he is in a state of natural imbecility or has disease of the mind to an extent that renders him incapable of appreciating the nature and quality of an act or omission or of knowing that an act or omission is wrong.
- (3) A person who has specific delusions, but is in other respects sane, shall not be acquitted on the ground of insanity unless the delusions caused him to believe in the existence of a state of things that, if it existed, would have justified or excused his act or omission.
- (4) Every one shall, until the contrary is proved, be presumed to be and to have been sane (Emphasis added).

Under this section true knowledge of the nature and quality of the act requires an intellectual knowledge of the physical nature of the act.

The most important difference between the rule as it has developed in England since the M'Naghten Case and section 16(2) of the Canadian Criminal Code is in the substitution of the word "appreciate" (in section 16) for the word "know" (M'Naghten's Rules). In fact there is a wide difference of opinion among judges regarding the interpretation of the intellectual test, but the tendency is to rely on English authorities.

In *R. v. Harrop*³ the judge said—

"The learned judge dealt in his charge very fully and lucidly with the first part down to the word "and" before the words "of knowing" in

¹ See Sheldon Glueck "Law and Psychiatry" op. cit. pp. 47-48.

² The Criminal Procedure (Insanity) Act of 1964 c. 84 brought some improvements in the procedure but does not affect the tests themselves.

³ (1940) 74 c.c.c. 228 (Man.)

the said section, and his direction that the accused's appreciation of "the nature and quality of the act" meant in that case her appreciation of its physical consequences, was the proper one to give.

In *Clark v. R.*¹ Judge Duff of the Supreme Court of Canada concluded:

...although we have an express declaration by the legislature, the Code really adds nothing to the common law; in fact the presumption of sanity of mind, involving criminal responsibility, is recognized in England as well as in all countries, and our inquiries need not carry us further, which are subject to the common law".

In *R. v. Cardinal* the head note reads:

"The test of insanity as an excuse for a crime is whether the accused knew the nature and quality of the act he was committing. If he did not, insanity is established. If he did, the enquiry must be made whether he knew at the time that the act was wrong. "Wrong" here does not mean wrong in the moral sense, but wrong in the sense that it was contrary to law: *Reg. v. Holmes* (1953) 1 W.L.R. 686".

In *R. v. Holmes*² it was stated that—

...the test of insanity as an excuse for a criminal act. . .is whether or not the man knew the nature and quality of the act he was doing. If he did not, that establishes insanity. If he did, one must then go further and say: "Did he knew at the time that the act was wrong?". . ."Wrong", according to the decision of this court, does not mean wrong in the moral sense, but wrong in the sense that it was contrary to law.

However the Royal Commission on the Law of Insanity as a Defence in Criminal Cases in Canada was of the opinion that in Canada "wrong" means morally wrong"³.

AMERICAN SYSTEM

In the United States the courts have made various attempts to liberalize the range of criminal responsibility.

First the M'Naghten Rules have been accompanied by the irresistible impulse test. Later the New Hampshire or Durham test brought a radical change in the test, and finally the American Law Institute in its Model Penal Code recommended a new test which has been adopted in part by Vermont.

the irresistible impulse test

This test applies to a defendant who may know the nature and quality of his act and may be aware that it is wrong, but who, nevertheless, may be irresistibly driven to commit a crime by an overpowering impulse resulting from a mental condition. This case should not be confused with the case in which a man is temporarily blinded by anger, jealousy, or other overriding passions. In such case, the irresistible impulse test does not apply because the criminal act is not the result of a mental condition.

¹ (1921) 61 R.S.C. 608

² (1953-54) 10. W.W.R. (N.S.) 403 (C.A. Alta).

³ (1953) 1 W.L.R. 686 (1953) 2 All E.R. 324.

⁴ See G. A. Martin "Insanity as a Defence". *The Criminal Law Quarterly* Vol. 8, 1965-66, p. 240.

The test of irresistible impulse was adopted in different cases¹ and in 1929 the court of Appeals for the District of Columbia defined it as follows:

"The accused must be capable not only of distinguishing between right and wrong but he was not impelled to do the act by an irresistible impulse which means before it will justify a verdict of acquittal that his reasoning powers were so far dethroned by his diseased mental condition as to deprive him of the will-power to resist to insane impulse to perpetrate the deed, through knowing it to be wrong".

However, the irresistible impulse test has been rejected in England, Canada and in a greater part of the United States². But in fifteen states³ the federal jurisdiction and the military have coupled this test with the M'Naghten right/wrong test and thus liberalized their gauge of criminal responsibility.

The New Hampshire and Durham Test

This test does not rest on the right-and-wrong formula like the M'Naghten does.

In the New Hampshire case it was stated—

"Whether the defendant had a mental disease. . . seems as much a question of fact as whether he had a bodily disease; and whether the killing of his wife was the product of that disease was also as clearly a matter of fact as whether thirst and a quickened pulse are the product of a fever. That it is a difficult question does not change the matter at all. The difficulty is intrinsic; (and) symptoms, phases, or manifestations of the disease as legal tests of capacity to entertain a criminal intent. . . are all clearly matters of evidence, to be weighed by the jury upon the question whether the act was the off-spring of insanity; if it was, a criminal intent did not produce it; if it was not, a criminal intent did produce it, and it was a crime."⁴

In Durham the court pointed out the chief objections to the prevailing criteria of responsibility in these words:

"We find that as an exclusive criterion the right-wrong test is inadequate in that (a) it does not take sufficient account of psychic realities and scientific knowledge, and (b) it is based upon one symptom and so cannot validly be applied in all circumstances. We find that the "irresistible impulse" test is also inadequate in that it gives no recognition to mental illness characterized by brooding and reflection and so relegates acts caused by such illness to the application of the inadequate right-wrong test. We conclude that a broader test should be adopted.

Invoking its authority to formulate tests of irresponsibility in the District of Columbia and its "inherent power to make the change prospectively" the Court then enunciated the radical change for the future which is the heart of the Durham decision; namely, that the rule to be applied on the retrial of Durham

¹ See page 675 of this study, footnote (3).

² See the Mentally Disabled and the Law. Report of the American Bar Foundation on the Rights of the Mentally Ill. The University of Chicago Press (1961).

³ The states are: Alabama, Arkansas, Colorado, Connecticut, Delaware, Indiana, Kentucky, Massachusetts, Michigan, New Mexico, Utah, Vermont, Virginia and Wyoming. Georgia has a delusional impulse test.

⁴ State v. Jones 50 N. H. 369, 398. 9 Am. Rep. 242, 264 (1871).

and thereafter is, "simply, that an accused is not criminally responsible if his unlawful act was the product of mental disease or mental defect". As the court noted, and as the reader will have noted, this is essentially the New Hampshire doctrine.

The court then expounded certain critical aspects of the new rule: First, it defined the term "disease" in the "sense of a condition which is considered capable of either improving or deteriorating", and the term "defect" in the sense of a condition which is not capable of either improving or deteriorating, and which may be either congenital, or the result of injury, or the residual effect of a "physical or mental disease"¹

In *Stewart v. U. S.*² two weeks after the *Durham* case was decided the United States Court of Appeals for the District of Columbia reversed and remanded a conviction for retrial under the *Durham* test on the ground "that it is error to charge the jury in a way from which they could infer that a mental disease is always physiological in nature, and error, also, to charge that a psychopath is a person of low intelligence and is never "insane" within the view of the law. The court reasoned that the trial judge had invaded the functions of expert witnesses and jury by treating factual issues either as having been settled by the testimony or as being matters of law. Questions of the nature of mental disease, it argued, are for the jury to assess in determining whether the standards of exoneration have been met. It is a matter of fact, not of law, whether a psychopathic personality meets the test."

On the other hand, in *Smith v. United States*³, the court (Bazelon, J. dissenting) held that testimony that accused had, prior to an attack on his wife with a dangerous weapon, become increasingly indolent, that he had a violent temper and that he made the unprovoked and unusually violent assault because of a supposedly "concocted grievance", was held to be not sufficient evidence to present the insanity issue for consideration of the jury.

Regarding the question of proof, the District of Columbia Court pointed out that, according to precedent in federal cases, whenever "some evidence" exists that the accused suffered from a diseased or defective condition" at the time of the prohibited act, "the trial court must provide the jury with guides for determining whether the accused can be held criminally responsible". In respect to such guidelines, the court said that the instruction should "in some way convey to the jury the sense and substance of the following":—

"If you...believe beyond a reasonable doubt that the accused was not suffering from a diseased or defective mental condition at the time he committed the criminal act charged, you may find him guilty. If you believe he was suffering from a diseased or defective mental condition when he committed the act, but believe beyond a reasonable doubt that the act was not the product of such mental abnormality, you may find him guilty. Unless you believe beyond a reasonable doubt either that he was not suffering from a diseased or defective mental condition, or, that the act was not the product of such abnormality, you must find the accused not guilty by reason of insanity⁴.

¹ Extract from "Law and Psychiatry" op. cit. p. 87.

² 214 F.2d. 879 (P.C. cir. 1954).

³ 272 F.2d 547 (D.C. Cir. 1959).

⁴ Sheldon Glueck op. cit. p. 90.

Considering the possibility of the jury concluding that a condition of mental abnormality is by itself sufficient to relieve the accused from responsibility, the court added the following caveat to its illustrative generalized charge:

... your task would not be completed upon finding, if you did find, that the accused suffered from a mental disease or defect. He would still be responsible for his unlawful act if there was no causal connection between such mental abnormality and the act.¹

It should be mentioned that after reversal of the conviction, and upon a new trial, Durham was again convicted of housebreaking and petty larceny and sentenced to a term of one to four years. Because the trial judge's instruction to the jury that the accused would remain in the hospital until determined to be "of sound mind" was followed by the prejudicial statement that "if the authorities adhered to their last opinion on this point, he will be released very shortly", the second conviction of Durham was also reversed.

It is obvious that the Durham case was an attempt to liberalize the test of criminal responsibility. It widens the scope of the relationship of various mental illnesses to irresponsibility.

Secondly, the broadening of the area of mental illnesses related to non-responsible behavior permits correlatively a much wider and deeper scope of psychiatric testimony. The relationship of mental disease to lack of responsibility has been widened and in this connection the Durham formula makes possible a continuous adjustment, with the progress of psychiatry.

Thirdly, the court points out that the division of labor implied in the Durham decision permits the jury "to perform its traditional function, to apply 'our inherited ideas of moral responsibility to individuals prosecuted for crime' . . . Juries will continue to make moral judgments, still operating under the fundamental principle that 'Our collective conscience does not allow punishment where it cannot impose blame' ".²

Psychiatrists for the most part applauded the Durham decision while the legal profession accepted it with some scepticism.

However the Durham decision has not been widely adopted outside of the District of Columbia. It has been rejected by numerous scholars, by at least four United States Circuit Courts of Appeals, by the United States Court of Military Appeals, and by the Supreme Courts of some nineteen states.

But the State of Maine has adopted the Durham rule by statute³. It has also been statutorily adopted in the Virgin Islands⁴.

Sheldon Glueck who makes a thorough examination of the Durham case in his book "Law and Psychiatry"⁵ gives the main reasons why this case has not been generally followed.

It is true that the Durham formulation leaves the jury without some specific guides⁶. Exculpation from criminal responsibility requires that the criminal act be "the product" of a mental disease" or "mental defect".

¹ Sheldon Glueck *op. cit.* p. 90.

² Extract from *Law and Psychiatry*, *op. cit.* p. 93.

⁶ *Commonwealth v. Chester*. 337 Mass. 702, 713, 150 N.E. 2d 914 920 (1958).

But the terms are vague and the Durham case does not provide the jury with the proper guidance to answer these questions¹.

Sheldon Glueck notices however that the situation was not different when the M'Naghten case was decided. And he points out that "the important words of the knowledge tests were not clearly defined even when laid down by the judges of England in 1843"².

One of the most frequent criticisms of Durham is that it relies too greatly on the undefined "product test"³ and that the product requirement seems to have no real meaning⁴.

In the Carter case⁵ the court explained that the "product test" does not require the act to be a direct or immediate result of mental disease. Rather it says the relationship between disease and act must be "critical" or "determinative" so that "the accused would not have committed that act if he had not been diseased as he was. . ."

The word "product" carries with it the idea of causality and one of the main criticisms is that Durham fails to provide necessary intervening links between mental aberration and irresponsibility. Durham jumps directly from the finding of mental disease to the conclusion of lack of responsibility without specifying that the jury should go through the intermediate stage of assessing the effect of the mental illness on the processes of rational conduct.

Consequently the mere proof of mental disease is virtually sufficient to establish criminal irresponsibility⁶.

On the other hand, since not only mental disability but cause-and-effect relationship between the disorder and the crime are specifically involved in the terms of the "product" rule, the prosecutor must also prove beyond a reasonable doubt that even if the accused was mentally disordered his criminal act was not the product of the disease or defect. To establish responsibility the prosecutor is required in effect to convince the jury that the defendant would have committed the crime even if he had not had a mental disease or defect.

In 1959 a Connecticut case⁷ rejected Durham on the ground, among others, that it will make the psychiatrist's judgement virtually conclusive. Of course the jury can disagree with psychiatrists but Durham's case gives psychiatric opinion great weight and makes it in great measure the arbiter.

However the Durham rule has been amplified by subsequent decisions of the United States Court of Appeals for the District of Columbia Circuit⁸. The Bar

⁷ State v. Davies, 146 Conn. 137, 148, A. 2d. 251 (1959).

⁸ Lyles v. U.S. 254, F. 2d. 725 (D.C. Cir. 1958); Carter v. U.S. 252 F. 2d 608 (D.C. Cir. 1957); Elding v. U.S. 251 F. 2d, 878 (D.C. Cir. 1957); Wright v. U.S. 250 F. 2d 4 (D.C. Cir. 1957); and Williams v. U.S. 250 F. 2d. 19 (D.C. Cir. 1957).

Association of the District of Columbia's Committee on Criminal Responsibility has stated the rule as of August 1959, to be as follows:—

"The accused is not responsible for a criminal act if such act was the product of a mental disease or mental defect. A mental disease is a diseased mental condition which may get better or get worse; a mental defect is a diseased mental condition which cannot get better and cannot get worse. The criminal act was the product of the mental disease or mental defect if the act would not have occurred except for the disease or defect; and that is so whether the disease or defect was the only cause of The cat, or the principal one of several causes, or one of several causes".

Four years after the Durham decision the author of the opinion, Judge David L. Bazelon, made the following remarks:

... The thesis of Durham is not complicated and it is not revolutionary. It is simply that juries should be told what is known about the dynamics of human behavior.

.....

The psychiatrist in the courtroom must understand that his function is not to make a legal determination of whether an accused is suffering from a mental disease or defect. That is for the judge and jury to decide. The psychiatrist's role is to supply the medical data—observed facts or opinions or both—upon which a legal determination can be based...

In spite of commentaries of all kinds made upon the Durham case, Sheldon Glueck does not hesitate to conclude that the "criticisms are not sufficiently persuasive to counteract its valuable potentialities". In fact it is a formula which deserves to be supplemented by the creative role of the judges.

The Vermont test

Recently Vermont abolished the use of the M'Naghten Rules and substituted for them a formulation very similar to that recommended by the American Law Institute's Model Penal Code.

As enacted in Vermont this test provides that:

- (1) "A person is not responsible for criminal conduct if at the time of such conduct as a result of mental disease or defect he lacks adequate capacity either to appreciate the criminality of his conduct or to conform his conduct to the requirements of law.
- (2) The terms "mental disease or defect" do not include an abnormality manifested only by repeated criminal or otherwise anti-social conduct. The terms "mental disease or defect" shall include congenital and traumatic mental conditions as well as disease.

The Vermont test differs from that suggested by the Model Penal Code in only two respects: (1) It substitutes the word "adequate" for the word "substantial" in the phrase "substantial capacity"; and (2) it adds a sentence which elaborates on the meaning of "mental disease or defect". In summary, it may be said that the Code and the Vermont formulations contemplate a further broadening of the M'Naghten-irresistible impulse combination in an effort to reflect

¹ Extract from "The Mentally Disabled and the Law". Report of the American Bar Foundation on the Rights of the Mentally Ill. The University of Chicago Press (1961).

some of the shades in the spectrum between complete mental collapse and complete understanding. At the same time, these formulations attempt to state a reasonably workable standard of criminal irresponsibility.

At least eleven states have incorporated some definition of criminal responsibility in their statutes. Not all of these statutory definitions specifically embody any particular test. Several speak in very general terms of "insanity" or "mental responsibility". For instance, the statutes of two states affix criminal liability only on a person "of sound mind who is neither an idiot, a lunatic, nor afflicted with insanity". . . . Wisconsin has likewise not made an attempt to codify any test but has rather allowed the courts to fill in the content of the phrase "a reasonable doubt of sanity or mental responsibility at the time of commission of the act".

On the other hand, legislatures in six states have adopted some variation of the M'Naghten rules in the statutes they have enacted. Colorado has supplemented the M'Naghten rules with the "irresistible impulse" test in its statutory definition of criminal responsibility. Of those few states which do not subscribe to some variety of the M'Naghten or irresistible impulse tests, Vermont alone has achieved this break with the prevailing standard through an act of the legislature.

The Model Penal Code test was considered and rejected in 1959 by the New Jersey Supreme Court⁽¹⁾ and by the Special Commission on Insanity of the Massachusetts Legislature. In 1957 it received like treatment from the majority of the Canadian Royal Commission which stated:

"We think the main proposal . . . (referring to the Model Penal Code 4.01) has many features of our law as presently interpreted and applied, but has the defect of having no jurisprudence to support it and would be much more difficult to present to a jury".

CONCLUSION

The criminal law at large is under transformation. Several concepts are being reviewed and remain under revaluation.

In this general field the law of insanity deserves particular attention because the solution of the problems it raises needs not only the skill of the lawyers but also of the psychiatrists. Unfortunately they do not always share the same philosophy and this makes difficult the finding of an ideal solution.

However, in the words of Glueck:

"With the steady improvement of psychiatric research and insight, we may expect psychiatric testimony to be more cautious and illuminative. With the steady expansion of legal learning influenced by relevant paralegal disciplines, we may expect a less mechanical jurisprudence to be reflected in judicial decisions. As is to be anticipated, there are individuals in both camps who tend to carry a professional chip on the shoulder. But on the whole I think it can be said with a fair amount of accuracy that

⁽¹⁾ State v. Lucas 30 N. Y. 37, 72, 152 A. 2d. 50-68-69 (1959).

there has been a considerable thaw in the cold war and that the practitioners of the ancient arts of medicine and law are at long last approaching a sympathetic and realistic understanding. And this, I think, gives promise of ripening in the not too distant future into an "entente cordiale".⁽¹⁾

APPENDIX 13

MENTAL ABNORMALITY AND THE CRIMINAL LAW

THE PRESENT SITUATION

(By Professor Stuart Ryan, Faculty of Law, Queen's University.)

1. General Survey

(1) (a) See generally:

(i) Barry Swadron, *Detention of the Mentally Disordered* (1964) Chs. 8-12

(ii) G. A. Martin. "Insanity as a Defence," J. Ll. J. Edwards "Automatism and Social Defence," and H. H. Bull, "Fitness to Stand Trial," (1966) 8 *Criminal Law Quarterly* 240-289.

(iii) *Report of Royal Commission on the Law of Insanity as a Defence in Criminal Cases* (Can. 1956).

(b) The "McNaghten Rules" do not express the law of Canada where their language differs from that of s. 16. It would be best not to refer to those rules in our courts. See *Report of Royal Commission*, above cited, at p. 8. English cases and those from the Common Law jurisdictions must for this reason be used with great caution.

(2) Mental abnormality affects criminal law and the penal processes in the following ways:

(a) A person who is "insane" as defined in s. 16 is not criminally responsible for his conduct while he is in that condition.

(b) A person who is "insane" within the meaning of s. 524, (where no statutory definition appears,) is not "fit to stand trial" on a charge of a criminal offence, and cannot be tried while he is in that condition, whether or not he would be found criminally responsible if he were tried.

(c) A person who is not "insane" but is "mentally abnormal" may for that reason be incapable of forming the intent which is a necessary element of a particular offence. *More v. R.* [1963] S.C.R. 522, 41 C.R. 98, [1963] 1 C.C.C. 289. See G.A. Martin, above cited, at p. 254, and "Necessity of Proof of Wrongful Intent in Criminal Cases," (1961) 4 *Crim. L.Q.* 63 at 67. See *R. v. Lenchitsky* [1954] *Crim. L.R.* 216. Whether this principle would apply to mental states other than intention is uncertain. "Mental abnormality" of certain kinds would be clearly relevant to offences involving recklessness or "advertent negligence" and should also be taken into account, in offences involving simple or "inadvertent" negligence, where the personal element is used as one of the basic facts on the issue of foreseeability.

(d) "Mental abnormality" of any kind or degree may lead to loss of self-control by a person who is provoked into culpable homicide and will be relevant on the question whether the offence is murder or manslaughter, assuming that the provocation is of such a nature as to be sufficient to deprive an ordinary person of the power of self-control. S. 203.

(e) A woman who by a wilful act or omission kills her newly-born child while "the balance of her mind is disturbed" as a result of giving birth or lactation is guilty not of murder or manslaughter but of infanticide. S. 204

(f) Mental abnormality of any kind is relevant to sentence when the court exercises discretion in awarding punishment under s. 621.

A mentally abnormal person may be placed on suspended sentence or probation under s. 638 on condition that he undergoes out-patient psychotherapy.

In most cases, death sentences imposed on mentally ill or mentally defective persons have been commuted to life imprisonment. A mentally abnormal person undergoing imprisonment receives psychiatric treatment in the penal institution to the extent that psychiatric services are available. At present, such services are inadequate, owing to shortage of psychiatrists. If his condition is severe, he may at least in some provinces, be treated while under sentence in a provincial mental hospital. It would appear that therapy in such institutions offers more hope of success than therapy in prisons. Plans for construction of medical-psychiatric units in the national penitentiary service have been announced.

See *Code s. 527*, as well as the *Penitentiary Act*, (1960-1, Can. C. 53) s. 19, and legislation of the several provinces respecting mental hospitals.

See Swadron, above cited, Ch. 12.

A person convicted of an offence mentioned in s. 661 if he is proved in a hearing conducted under s. 662-3 to be a "dangerous sexual offender" as defined in s. 659(b), must be sentenced to preventive detention which means life imprisonment subject to special provision for parole. Such persons are kept in ordinary penitentiaries, where some are segregated in psychiatric wards and others in dissociation cells, and others are kept in the general population. Some of them receive psychiatric therapy; others do not. Not all are mentally abnormal.

When s. 17 of the *Narcotic Control Act* 1961, (1960-1 Can. c. 35) is brought into force, a narcotic addict convicted of an offence under s. 3, 4 or 5 of that Act will be sentenced to an indeterminate period of treatment in custody which may be life-long, subject to special provision for parole. Addicts sentenced to penitentiary terms in western Canada are, it is understood, confined in Matsqui Institution and are subjected to a regime designed as therapeutic. Similar treatment is afforded in some provincial institutions and in the Prison for Women. At present, other addicts are not given any particular treatment for their addictions.

(g) For responsibility for automatic conduct related to mental abnormality, see J. Ll. J. Edwards, above cited, at pp. 269-289, and L. H. Leigh, *Automatism and Insanity*, (1962) 5 *Criminal Law Quarterly* 160. See also note 3(2), below.

(h) The criminal law also contains provisions designed to protect mentally abnormal persons, such as ss. 140, 186(1) (c) and 194(5)(d).

(3) Provisions of the Code governing procedure in cases involving mentally abnormal persons are as follows:

(a) Remand in custody for observation before or during preliminary hearing (s. 451(c)), or trial of indictable offence (s. 524(1a)), or trial of summary offence (s. 710(5)), if on the evidence of at least one medical practitioner there is reason to believe that the accused is mentally ill.

Provincial legislation in Ontario R.S.O. 1960, c. 172, s. 38) and Saskatchewan (1961 Sask C. 68 s. 17) authorized similar remands without the requirement

of hearing medical evidence. Under the Ontario statute, the remand may be for 60 days. Under the Saskatchewan Act the remand may be either in or out of custody.

The power given to the Lieutenant-Governor by s. 527 to transfer a person who on evidence satisfactory to him is insane, mentally ill, mentally deficient or feeble-minded from a "prison" to a "place of safekeeping," to be detained until the Lieutenant-Governor is satisfied that he is recovered is, in practice in some if not all provinces, interpreted to authorize such transfer before or during trial as well as after conviction. A "feeble-minded" person is defined in s. 2(17), as somebody who from birth or early age is so mentally deficient that he requires care, supervision and control but is above an "imbecile".

In *Fawcett v. A. G. Ont.* [1964] S.C.R. 625, 44 C.R. 401, [1964] 1 C.C.C. 164, the S.C.C. held that a person remanded under s. 524(1a) (and, by inference, under s. 451(c) or s. 710(5)) could be certified as mentally ill under provincial legislation and detained in a provincial mental hospital after the period of remand. No statutory provision determines whether a person so detained is to be tried after his release from the mental hospital for the offence originally charged against him. Since the certification does not determine whether he is "fit to stand trial" or whether he is "sane" or "insane", and he may have been at all times both "sane" and "fit to stand trial," it is desirable that some provision be made for disposal of the pending charge. In practice, a discretionary decision is made by the Attorney-General or his agent whether to proceed with it or not. If it is not proceeded with it should be dismissed; otherwise it remains suspended like the sword of Damocles over the head of the accused during his whole life. It is understood that dismissal does not always occur.

In most cases, the accused so remanded is returned to the court with a psychiatrist's report. Some psychiatrists are uncertain how to report on his condition, particularly if he does not appear to be "insane" under s. 16 or "unfit to stand trial". A complete report will be of assistance to the court in sentencing if the accused is convicted, but there is some reluctance to submit a "pre-sentence" report on a man who has not been convicted. Nevertheless, such reports have proved valuable, even at the pre-trial stage, in a large number of cases.

See generally, Swadron, above cited Ch. 8.

(b) "Fitness to stand trial" is determined under s. 524. Under S. 525, the same procedure is to be followed if the accused is brought before the court to be discharged for want of prosecution.

In each case, under ss. 524 and 526, the accused is to be kept in custody during the pleasure of the Lieutenant-Governor. Under this procedure, either the accused is not tried or his trial is not completed. He may therefore be tried later on if he is then fit to stand trial. There seems therefore to be an element of oppression in s. 525, since the accused would otherwise be entitled to an acquittal and could be dealt with under provincial mental health legislation if his detention were necessary, whereas release of persons detained under s. 526 or s. 527 is not easily obtained, if at all, and the decisions are made partly at least on political grounds.

See generally, Swadron, above cited, Ch. 9.

(c) The issue of "insanity", within the meaning of s. 16, as affecting criminal responsibility, is raised by a plea of "not guilty". See s. 515. It is common and

usually prudent practice, although not strictly compulsory, for counsel who intends to rely on "insanity" as a defence to inform the court of his intention at the time of pleading. Under a plea of "not guilty", it may be argued on behalf of the accused that he didn't do the act, but if he did he was insane when he did it. These two "defences" don't go well together, and are rarely used at the same time.

Under s. 523, a court or jury acquitting on the ground of insanity is required to make a finding and declaration to that effect. The common form of verdict in that case is "not guilty by reason of insanity".

Under s. 523(2) and 526, a person acquitted by reason of insanity is kept in custody during the pleasure of the Lieutenant-Governor.

(d) persons detained under s. 526 or s. 527 are normally kept in provincial mental hospitals, but there is no legal requirement to this effect.

(e) For use of previous testimony of a witness who has become insane, see s. 519(1) (b).

2. Meaning of "Insanity" and other Terms

(1) "Insanity" is a word long ago discarded as obsolete and irrelevant in medical science, by retaining which legislators, judges and lawyers cause much confusion.

The confusion is increased because in criminal law the term has two different meanings.

(a) Under s. 16, with reference to criminal responsibility, it is related to capacity to appreciate the nature and quality of an act or omission or to know that an act or omission is wrong. See G.A. Martin, above cited.

(b) Under s. 524, with reference to fitness to stand trial, it is related to capacity to understand the nature of the offence charged and of the criminal process and its consequences and to "instruct counsel," that is to say, to give a reasonably rational account of the facts within his knowledge and belief and to understand counsel's advice, and to plead and act in a reasonably rational manner during the trial. See H.H. Bull, above cited.

Further, the critical time for the issue of criminal responsibility is the time of the conduct alleged to have constituted the offence, while the critical time for the issue of fitness to stand trial is the time of the trial. (See *Sodeman v. R.* (1936) 55 C.L.R. 192 (Aus. H.C.)).

A person who is fit to stand trial may be free from criminal responsibility on the ground of insanity. The reverse may also be true, but the question of criminal responsibility can never be determined unless the accused is fit to stand trial at some time when the state and the court are both ready to try him. A person who is at one time unfit to stand trial may later be fit and may then be tried and may be found to have been either "sane" or "insane", within the meaning of s. 16, at the time of the conduct in question.

(2)(a) "Insanity" under s. 16 may result from "natural imbecility" or "disease of the mind".

The term "natural imbecility" is no longer used in medicine, having been replaced by "mental defect," "mental deficiency" or "intellectual deficiency", but

it is a carry-over from a time when mentally deficient persons were described as morons, imbeciles and idiots, in decreasing order of intelligence.

The phrase "disease of the mind" corresponds roughly with the medical terms "mental disease" or "mental illness", but medical classification and terminology are not uniform. Medical concepts of mental abnormality, otherwise than in relation to mental defect, do not in any event correspond with either legal definition of "Insanity".

(b) The broad band of mental abnormality which is the special concern of the psychiatrist and the psychologist includes conditions some of which are and others of which are not described as "mental diseases" or "mental illnesses". There is, indeed, one school of psychiatrists who deny the existence of "mental disease," as such. They substitute "an altered internal status of the individual vis-à-vis his external world as interpreted by others", or similar expressions. Although orthodox medical doctrine does not fully accept their conclusions, their arguments are of value in emphasizing the fact that many mental disorders are not clearly distinguishable from each other and individual patients may suffer from conditions exhibiting features of more than one of the accepted classifications.

(3) The following greatly simplified classification of mental abnormality appears to be generally accepted in medical science.

(a) States of "mental defect" or "intellectual deficiency", almost infinitely graded.

(b) "Psychotic states" or "psychoses", in which the patient has an acquired state of mental abnormality by which the personality is markedly altered so that he loses his normal appreciation of reality and may become deluded and may suffer hallucinations, and he therefore feels, thinks and behaves in ways not normal to him.

(i) Some psychoses are organic in origin, being caused by some poison, including alcohol and certain drugs, or some chemical derangement of the brain, or a physical derangement or partial destruction of the brain, through injury, brain tumour, meningitis, encephalitis, syphilis, arteriosclerosis, Huntington's chorea, or some other disease, or by senility.

(ii) Other psychoses are "functional" where no evidence of physical disturbance or damage to the brain is found. This group includes manic-depressive and melancholic states, various kinds of schizophrenia, and other disorders.

(c) Epilepsy is a complex group of conditions in which there are sudden, or relatively sudden, recurrent and transient derangements of brain function and either complete unconsciousness or a "cloudy mental state," followed by complete or partial amnesia covering varying periods. Seizures may be violent and marked by gross symptoms or brief interruptions of consciousness recognized only by a blank stare and interruption of speech. In a form known as "psychomotor" or "temporal lobe" epilepsy, the patient is neither normally conscious nor unconscious and may automatically engage in ostensibly purposeful conduct which may include motiveless acts of great violence and apparent cruelty. Epilepsy may be but is not usually accompanied by other mental abnormality; the patient may have any degree of intelligence; he may be a genius, as was Julius Caesar.

(d) Neuroses are conditions in which the patient is disturbed by psychological or physical symptoms which represent a psychological reaction to his problems and difficulties. Emotional in origin and affecting conduct, these disturbances do not prevent normal appreciation of reality and social behaviour, and do not cause delusions or hallucinations. Neuroses include anxiety states, hysteria with or without fugue or amnesia, excessive fatigue, irritability, physical complaints and obsessive-compulsive conditions, such as excessive concern for cleanliness, ritualistic activity, occasionally kleptomania and rarely pyromania, although some kleptomaniacs and pyromaniacs suffer from other mental disorders.

(e) Abnormal personalities, including:

(i) The psychopathic or sociopathic personality, variously defined but usually marked by consistent failure to display evidence of a normal conscience, inability to feel guilt or remorse or sympathy for others, habitual anti-social activity with usually little or no evidence of prudence or long-term foresight of consequences, apparent inability to learn from experience or profit from instruction or punishment, and absence of any other form of mental disorder. This condition is highly resistant to treatment in most cases. (The term "sexual psychopath" should be avoided since it indicates and suggests confusion and misunderstanding of several concepts, not related to the psychopathic or sociopathic personality. It is no longer used in Canadian criminal law, but is used in some jurisdictions in the United States.)

(ii) Alcoholics who may but need not suffer from another mental disorder.

(iii) Drug addicts who may but need not suffer from another mental disorder. Drugs of addiction include opium and its derivatives, chiefly morphine and heroin, cocaine and related drugs, hemp derivatives including marijuana, and other hallucinogens (although physiological addiction to some of these drugs has not yet been demonstrated), barbiturates, amphetamines and tranquilizers.

(iv) Included in this group are some "dangerous sexual offenders" defined in s. 659(b), but this is a statutory not a medical definition. Not all "dangerous sexual offenders" so defined are deviates; some of them are not in fact dangerous.

(v) A woman suffering from the effects of childbirth or lactation may experience mental disturbance which may cause her to kill her child. This condition may be accompanied or followed by some other mental disorder.

4) "*Natural imbecility*" or "*disease of the mind*"

Little difficulty is experienced in accommodating medical terminology to fit the term "natural imbecility." The question for the purpose of s. 16 is one of degree.

In a sense, the phrase "disease of the mind" is irrelevant to medical science, except insofar as conformity to criminal and other legislation is required. All mental abnormalities call for treatment, although some do not respond to any treatment so far devised. Except for the distinction between mental normali-

ties of organic origin and those of functional origin, it is impossible to find clearly defined boundaries marking off one kind of disorder from another. The accepted classification of functional disorders is otherwise based more on symptoms than on causes. One patient may display symptoms suggesting more than one category. The distinction between neuroses and psychoses may in certain cases be only a matter of degree and there may be differences of professional opinion over the correct category.

However, except for those mentioned in paragraph (2) (b) above, psychiatrists generally agree that functional psychoses are "diseases of the mind." Some describe organic psychoses as "diseases of the brain" rather than of the "mind", because of their physical or physiological aspects, but others regard these also as "diseases of the mind." Epilepsy creates more difficulty in classification, because many epileptics are not mentally abnormal except while undergoing epileptic attacks, and some of them can keep their symptoms fairly well under control by diet and drugs while some others can obtain relief through surgery. Some psychiatrists therefore describe epilepsy as a "disease of the brain", but others classify it as a "disease of the mind". As noted in paragraph 3(2), below, the courts may tend to regard it as a "disease of the mind" along with all kinds of psychoses.

Some psychiatrists in the United States regard "psychopathy" or "sociopathy" as a "disease of the mind", but others do not. In Canada, there is not universal acceptance of the existence of the category; where it is recognized it is generally classified not as a "disease" but as a "personality state". The psychopath or sociopath is not within the definition in s. 16(2), unless some other disorder renders him "insane".

"Neuroses" and other "personality states" are not generally regarded as "diseases of the mind", at least within the meaning of s. 16, although they create conditions calling for treatment.

Although for some purposes analysis of mental functions as intellectual, emotional and conative (related to the will) is still employed, medical science now rejects the concept of a mental disorder which affects only one or two of these functions. The workings of the mind are so interrelated that when a person suffers from a mental disorder it affects all these functions in him. A person who suffers from specific delusions, as in s. 16(3), cannot be medically regarded as "in other respects sane"; this fact is of little significance since subs. (3) adds little if anything to subs. (2).

3. "Insanity" under s. 16.

(1) Criminal law is not at present concerned directly with these medical categories in relation to criminal responsibility except insofar as they describe what may be called "natural imbecility" or "disease of the mind", in relation to the question on whether the accused was at the critical time capable of appreciating the nature and quality of his conduct or of knowing that it was wrong. *R. v. Brockenshire et al.*, [1931] O.R. 806, 56 C.C.C. 340, [1932] 1 D.L.R. 156.

The ostensible concern of the law with problems of understanding and apparent refusal to take into account disorders of the emotions and the will make it difficult for some psychiatrists to deal effectively with the problem of "insanity" in relation to criminal responsibility. Others accept legal terminology and interpret their science in legal categories, asserting in substance that the major

organic and functional psychoses affect the intellect and can deprive the patient of the capacity for understanding which is necessary for criminal responsibility.

(2) No distinction appears to have been made by the courts or by expert witnesses between organic and functional conditions as being or not being diseases of the mind" for the purpose of s. 16 until unconscious automatism was recognized as negating voluntary conduct.

In *R. v. Charlson* [1955] 1 W.L.R. 317 [1955] 1 All E.R. 859 39 Cr. App. 37, evidence that accused might be suffering from a brain tumour was accepted for the first time as tending to prove, not a disease of the mind but a physical or organic disease, and as supporting an inference, not of "insanity" but of "non-insane automatism".

In *R. v. Schonberger* (1960) 31 W.W.R. 97, 33 C.R. 107, 126 C.C.C. 113, evidence indicating possible organically caused automatism which could be induced by alcohol was accepted for the same purpose.

However, in *R. v. Kemp* [1957] 1 Q.B. 399, [1956] 3 W.L.R. 724, [1956] 3 All E.R. 249, 40 Cr. App. R. 121, (arterio-sclerosis), *R. v. Cottle* [1958] N.Z.L.R. 999, (psychomotor epilepsy), *Bratty v. A.G.N.I.* [1963] A.C. 386, [1961] 3 All E.R. 23, [1961] 3, W.L.R. 965, 46 Cr. App. R. 1, (psychomotor epilepsy), and *R. v. Brien* (N.B.C.A.) [1966] 3 C.C.C. 288, (psychomotor epilepsy) courts in England, New Zealand, and the House of Lords for Northern Ireland, and now Canada, have required evidence of organically based automatic conduct to be related to "insanity" and not to "non-insane automatism."

In *R. v. Ditto* (1962) 38 W.W.R. 480, 38 C.R. 32, 132 C.C.C. 198, it was held that a person suffering from psychomotor epilepsy could be unfit to stand trial by reason of insanity while undergoing an epileptic attack and fit to stand trial after covering.

Under the rule in *Bratty v. A.G.N.I.* in this situation, if the jury do not find the accused "insane", a verdict of acquittal on the ground of automatism is possible only if there is evidence of some cause other than the organic condition (perhaps a blow on the head) which could have caused automatism.

This rule and other possible solutions are discussed by J.L.I.J. Edwards, *supra* cited, at pp. 285-9. He recommends some "social defensive measure" because of the danger of recurrent automatism causing future harm.

While this concern is justified, the rule in *Bratty's* case will often be unjust and oppressive to the accused whose automatism is caused by epilepsy or another organic condition. He may be convicted because the jury fails to give adequate weight to expert evidence, having regard to the burden of proof of insanity resting on him. If he is acquitted by reason of insanity he will be detained during the pleasure of the Lieutenant-Governor, perhaps for life, in an institution whose authorities cannot release him except under authority of a political decision which may never be made. Yet, with proper diet and drugs or, in some cases, after surgery he may be perfectly safe at large.

Fortunately, there has been no tendency to extend the rule in *Bratty's* case to persons suffering from diabetes. Their cases have been dealt with under automatism.

See also note 3(4) below, "Insanity and Intoxication."

Some better solution of the problem of the epileptic and other persons in this class must be found. The English and Scottish defence of "diminished

responsibility" applies only to homicide cases, and results as a rule in a term of imprisonment which is inappropriate in many cases.

(3) *Capacity to appreciate the nature and quality of conduct*

The proposition that persons suffering from the major organic or functional psychoses lack capacity to appreciate the nature and quality of their conduct appears to be correct if the language of s. 16(2) is understood, as it should be, as referring to capacity to foresee and measure the nature and consequences of conduct or to estimate aright the full force of an act or omission, or to know it to be wrong, not merely legally wrong but wrong in the sense that it is something one ought not to do and for which one would be condemned in the eyes of his fellow men.

See *Report of Royal Commission*, above cited, at p. 13, and G. A. Martin above cited, at pp. 243-4.

As Mr. Martin says, at pp. 245-6, there is evidence that the courts are beginning to accept such a presentation.

See *R. v. O.* (1959) 3 Crim. L.Q. 151, where McRuer C.J.H.C. instructed the jury in accordance with the above mentioned standard.

In *R. v. Laycock* (1952) O.R. 908, 15 C.R. 292, 104 C.C.C. 274, the C.A. ordered a new trial because the trial judge had not explained the psychiatric evidence on the issue of insanity to the jury.

See also *R. v. Levionnais* [1956] O.R. 230, 114 C.C.C. 266.

We cannot however, be confident that judges, lawyers and juries will understand their duties in this way, even assuming that there are available expert witnesses who will use this manner of expression. As mentioned above, not all psychiatrists have found themselves able to express themselves in this terminology. Differences of expression cause confusion, and tend to bring expert evidence into disrepute.

The attack on expert witness in *R. v. de Tonnancourt* (1958) 24 C.R. 19, 1 W.W.R. 337, 115 W.W.R. 337, 115 C.C.C. 154, was undeserved and unfair, and not in accord with the policies or practices of the courts. The decision is however, correct in stating that the issue of sanity or insanity is for the jury to decide. They may and ought to disregard the opinions of experts if other evidence requires them to do so. They may have to accept the opinion of one expert and reject that of another. They may find insanity without the aid of expert evidence but are most unlikely to do so. They are more likely to reject clear expert evidence supporting a finding of insanity. "Irresistible impulse" to perform an act or omission is not *per se* "insanity" within s. 16(2). This principle has been consistently maintained in Canada, England and Australia. See *R. v. Jessamine* (1912) 21 O.W.R. 392, 3 O.W.N. 753, 19 C.C.C. 214, 1 D.L.R. 285. But evidence that accused suffers from an irresistible impulse which could be a symptom of a disease of the mind that could affect his capacity to appreciate the nature and quality of his conduct must be received and explained to the jury who should consider it along with other evidence on the issue. *A.G. So. Australia v. Brown* [1960] A.C. 432, 44 Cr. App. R. 100, [1960] 2 W.L.R. 558, [1960] 1 A.E.R. 734 (P.C.).

See *R. v. Porter* (1956) 55 C.L.R. 182, (Aus. H.C.).

(4) *Capacity to Know that conduct is wrong*

(a) In England it is apparently established that "wrong" means "contrary to law" or "illegal".

R. v. Windle (1952 2 Q.B. 826, [1952] 2 All E.R. 1, [1952] 1 T.L.R. 1344, 36 Cr. App. R. 85.

The Australian High Court has refused to accept this rule, in *Stapleton v. R.* (1952) 86 C.L.R. 358, [1952] A.L.R. 929, where it was held that incapacity to know that conduct was morally wrong in the eyes of reasonable men, or to know that it was contrary to law, would support a finding of insanity.

The C.A. Ont. asserted substantially the same principle in *R. v. Laycock* [1952] O.R. 908, 15 C.R. 292, 104 C.C.C. 274.

The Royal Commission on Insanity, above mentioned, approved this interpretation, at p. 14, using the expression "not. . . merely legally wrong but wrong in the sense that it was something he ought not to do and for which he would be condemned in the eyes of his fellow men."

This language was used by McRuer C.J.H.C. in instructing the jury in *R. v. .* (1959) 3 Crim. L.Q. 151

See also *R. v. Harrop* [1940] 3 W.W.R. 77, 48 Man. R. 113, 74 C.C.C. 228, (1940) 4 D.L.R. 80, and *R. v. Cracknell* [1931] O.R. 634, 56 C.C.C. 190, [1931] 4 L.R. 657.

This interpretation has not been unanimously accepted in Canada.

In Alberta, it was held by the S.C. Appellate Division, in *R. v. Cardinal* (1953) 10 W.W.R. (N.S.) 403, 17 C.R. 373, that "wrong" means "contrary to law". This rule was applied, by implication, by the same Court in *R. v. Wolfson* (1965) 46 C.R. 8, [1965] 3 C.C.C. 304.

The Supreme Court of Canada has not had to decide the question. The present trend of its decisions suggests that it will adopt the interpretation of the *Royal Commission*, which appears to be correct.

(b) The problem which arose out of the language of the former Code, whether insanity required incapacity both to appreciate the nature and quality of conduct and to know that it is wrong, has been removed by the language of s. (2). Either form of incapacity requires a finding of insanity. Both questions must be left in the alternative to the jury *R. v. Laycock*, *R. v. Cardinal*, *R. v. Harrop*, above.

(5) *An act or omission*

The use of "an" has caused some question concerning a possible change in legislative intent. The Royal Commission above mentioned, at p. 34, expressed confidence that the courts would interpret s. 16 (2) as referable to the conduct which is the subject of the charge. This has in fact occurred, and no problem appears to have arisen in practice.

(6) *Specific delusion*

For examples of delusions held not to support a finding of "insanity" see *R. v. Riel* (1885) 2 Man. R. 321, 1 Terr. L. R. 23, leave to appeal refused (1885) 10 P. Cas. 675, and *Whitelaw v. Wilson* [1934] O.R. 415, 62 C.C.C. 172, [1934] 3 L.R. 554.

However, the existence of a specific delusion, even if it does not justify or excuse the conduct in question, is evidence from which "insanity" may be inferred, and the general question of "insanity" under s. 16 (2) must also be left to the jury.

See on this point *R. v. Moke* [1917] 3 W.W.R. 575, 12 Alta L.R. 18, 28 C.C.O. 296, 38 D.L.R. 441.

(5) *Insanity and Intoxication*

A highly intoxicated person who is otherwise normal may exhibit symptoms suggesting that he lacks the capacity mentioned in s. 16 (2), but he is not for that reason treated as "insane."

On the other hand, brain damage resulting in "disease of the mind" may be caused by excessive consumption of alcohol, particularly if it is carried on over a prolonged period. A person suffering from that condition may be "insane" within the meaning of s. 16. *D.P.P. v. Beard* [1920] A.C. 479, [1920] All E.R. 21, 89 L.J.K.B. 437, 122 L.T. 625, 36 T.L.R. 379, 26 Cox. C.C. 573, 14 Cr. App. R. 159.

See *McAskill v. R.* [1931] S.C.R. 330, 55 C.C.C. 81, [1931] 3 D.L.R. 166.

An advanced form of such "insanity" is *delirium tremens*.

A situation can arise in which a person who would not be "insane" if he were sober becomes "insane" within the meaning of s. 16 by reason of consumption of alcohol, perhaps in cases of functional psychoses but certainly if organic psychoses and epilepsy are regarded as "diseases of the mind" and if persons who act automatically as a result of those conditions must rely on "insanity" as a defence. Epileptic seizures may be brought on by alcohol and other organic conditions can be aggravated by it and persons so suffering may become unconscious automatons.

In *R. v. Schonberger*, paragraph 2 (2), above, the court held that the jury should be instructed that they should acquit on the ground of automatism if the accused might have been acting automatically as a result of a combination of alcohol and an organic condition.

If the rule in *Bratty's case* (paragraph (2), above) prevails, the judgment of the H. of L. in *A.G.N.I. v. Gallagher* [1963] A.C. 349, [1961] 3 All E.R. 299, [1961] 3 W.L.R. 619, 45 Cr. App. R. 316, may cause trouble. The result of the case may have been correct on the facts, but the Law Lords approved an instruction to the jury which forbade them to take the drinking of liquor into account on the issue of insanity and required them to look in this issue only at the state of mind of accused before he began to drink. They said that the defence of insanity, as opposed to drunkenness, could not be made good with the aid of liquor, and the defence of drunkenness was not available because accused had already formed the intent to kill before he began to drink. The second proposition in this statement can be valid only if the accused was never intoxicated enough to permit the defence of drunkenness to be considered at all, because he were so intoxicated as to be incapable of forming the intent necessary to commit murder he could not have continued to have the intent to kill. The first statement may have been accurate in relation to the facts of the case, since accused was described as a "psychopath", suffering from a "disease of the mind" which would be aggravated by drink in such a way as to cause him more readily to lose his self control, and it does not appear that his condition when intoxicated would have brought him within s. 16 (2).

However, the Law Lords purported to state a general rule precluding the effect of alcohol from being taken into account at all in any case on the issue of insanity. It is submitted that this type of dichotomy is an unfruitful exercise in arid semanticism, that there is no foundation or justification for such a rule, and that the proper course is to recognize the combined effect of alcohol and a "disease of the mind" if as a result of both together the accused is in the condition described in s. 16 (2).

4. Burden of Proof.

The effect of s. 16 (4) is to place the burden, both evidentiary and persuasive, of proving insanity, not beyond a reasonable doubt but on the balance of probabilities, on the party who asserts it. This may be expressed in several ways, such as, "on a preponderance of evidence," *Hebert v. R.* [1955] S.C.R. 120, 20 C.R. 79, 113 C.C.C. 97, or "to your reasonable satisfaction," *Clark v. R.* (1921) 61 S.C.R. 608, [1921] 2 W.W.R. 446, 35 C.C.C. 261, 59 D.L.R. 121.

It is wrong to use in Canada the expression "clearly proved", although it appears in the "McNaghten Rules."

R. v. Chupiuik [1949] 2 W.W.R. 801, 8 C.R. 398, 95 C.C.C. 198.

See *R. v. Cardinal*, above.

5. Who may raise issue of insanity under s. 16?

Although there is no direct Canadian authority, insanity is unanimously regarded as a defence. It would seem incongruous for the prosecution to ask for an acquittal, even by reason of insanity. Although the prosecutor or the Court may raise the issue of fitness to stand trial under s. 524, the decision to rely on freedom from criminal responsibility on the ground of insanity can, in the first instance, be raised only by the accused.

See *R. v. Smith* (1912) 8 Cr. App. R. 72.

In *R. v. Dashwood* [1943] I.K.B. 1, [1942] 2 All E.R. 586, 112 L.J.K.B. 257, 8 Cr. App. R. 167, counsel for accused wished to rely on insanity but accused could not do so, dismissed counsel, conducted his own defence and was convicted. On appeal, leave to introduce fresh evidence of insanity was refused. If accused was in fact insane, this procedural rigidity no doubt caused a miscarriage of justice.

On the other hand, insanity is rarely raised as a defence, except to capital murder charges, and even then not in all cases.

Sometimes, even in capital cases, it seems better from the tactical point of view to try for an outright acquittal. In other than capital cases, a term of imprisonment often seems less undesirable to the accused or his counsel than a potential lifetime detention in a maximum security mental hospital. It seems unjust to deprive the accused of the freedom of choice of defence, but, if he is "insane", can he make a rational choice, and, if not, can his counsel properly make it for him? On one side, the question is whether justice is served by accepting the chance that some "insane" persons with criminal tendencies may go at large. On the other hand, respect for liberty seems to preclude what is in effect penal confinement of one who has not committed the "actus reus", and who may be confined, if necessary, under non-penal provincial legislation.

In several recent English cases, where a defence based on diminished responsibility was introduced, the prosecutor was allowed to rebut this defence by introducing evidence and argument in support of a verdict based on "insanity" and this practice has been authorized there by statute. The courts also allow it, without statutory authority, where the defence is based on automatism. See *R. v. Kemp*, above, note 3 (2). The rule in *Bratty's case*, above, note 3 (2), where the alleged automatism is attributed to what the court calls a "disease of the mind", requires the issue of insanity and no other to be submitted to the jury, even though accused expressly disclaims any reliance on that defence, unless there is also evidence suggesting another possible cause of automatism, such as a blow on the head. The N.B.C.A. applied this rule in *R. v. O'Brien*, above, note 3 (2), although accused at trial, by her counsel, had expressly denied insanity and the only psychiatrist who testified had described psychomotor epilepsy as a "disease of the brain" not a "disease of the mind."

5. *Insanity and other defences*

Accused may rely alternatively on insanity and other defences, such as self defence, provocation or drunkenness. Each should be explained separately to the jury.

Lowther v. R. (1957) 26 C.R. 150.

6. *Appeal*

(a) Accused cannot appeal against an acquittal by reason of insanity. See s. 583. He appears to have no legal way of obtaining review of his case. This may result in a miscarriage of justice if the trial court has, against the expressed wish of the accused, found him not guilty by reason of insanity when he should have been acquitted on the ground of automatism. The Minister of Justice cannot intervene under s. 596, because there has been no conviction, and the Lieutenant-Governor cannot be compelled to release the accused.

(b) If the defence of insanity is rejected at trial, the Court of Appeal may accept it on appeal and make the appropriate order s. 596 (1) (d).

(c) The Attorney-General may appeal against acquittal by reason of insanity on a question of law. s. 584 (1) (a).

APPENDIX 14

ALTERNATIVES TO THE M'NAGHTEN RULES

(BY PROFESSOR STANLEY BECK.)

The law has long struggled with the problem of excusing from criminal liability those who cannot be held directly "responsible" for their acts. In 1724, the so-called "wild beast" test was enunciated in *Rex v. Arnold*. It provided for exculpation if the defendant "doth not know what he is doing, no more than a wild beast." Later in the eighteenth century, the "wild beast" test was abandoned and an accused escaped punishment if he could not distinguish "right and wrong". Little progress was made until 1843 when Daniel M'Naghten was found 'not guilty by reason of insanity'. M'Naghten's defense counsel relied in part on Dr. Isaac Ray's classic work 'Medical Jurisprudence of Insanity' which had been published in 1838. Dr. Ray's book, which was used and referred to extensively at the trial, contained many enlightened views on the subject of criminal responsibility in general and on the weaknesses of the right and wrong test in particular. Most importantly, the jury was told that the human mind is not compartmentalized, and that a defect in one aspect of the personality could spill over and affect other areas. Dr. Ray called knowledge of right and wrong a "fallacious test of criminal responsibility." M'Naghten's acquittal, however, raised such a public outcry that the House of Lords was summoned "to take the opinion of the judges on the law governing such cases." In responding for the fifteen judges who considered the problem, Lord Chief Justice Turdal enunciated what has come to be known as the M'Naghten Rules or M'Naghten Tests. In giving his opinion, Turdal did not follow Dr. Ray's work which he had relied upon at the trial, but rather reaffirmed the old right-wrong test. As a result, just at the time when psychiatry was beginning to develop, and to find a place in the criminal law, a nineteenth century idea of the human mind became the test of criminal responsibility whenever the accused's mental capacity was in issue.

The report of the English Royal Commission on Capital Punishment 1949-1963, articulated the basic defects of the M'Naghten rules. The Commission said, "They are not in harmony with modern medical science which, as we have seen, is reluctant to divide the mind into separate compartments—the intellect, the emotions and the will—but looks at it as a whole and considers that insanity distorts and impairs the actions of the mind as a whole." The Commission lends vivid support to this conclusion by pointing out that "it would be impossible to apply modern methods of care and treatment in mental hospitals, and at the same time to maintain order and discipline, if the great majority of the patients, even among the grossly insane did not know what is forbidden by the rules and that, if they break them, they are liable to forfeit some privilege. Examination of a number of individual cases in which a verdict of guilty but insane was returned, if rightly returned, has convinced us that there are few indeed where the accused can truly be said to have known that his act was wrong."

The right-wrong test, which considers knowledge or reason alone, is clearly an inadequate guide to responsibility for criminal behaviour. This is made clear by the following quote from Professor Sheldon Glueck of the Harvard Law

School, in discussing the right-wrong tests: "It is evident that the knowledge tests unscientifically abstract out of the mental make-up but one phase or element of mental life, and cognitive, which, in this era of dynamic psychology, is beginning to be regarded as not the most important factor in conduct and its disorders. In brief, these tests proceed upon the following questionable assumptions of an outworn era in psychiatry:

- (1) That lack of knowledge of the nature or quality of an act (assuming the meaning of such terms to be clear), or incapacity to know right from wrong, is the sole or even the most important symptom of mental disorder;
- (2) That such knowledge is a sole instigator and guide of conduct, or at least the most important element therein, and consequently should be the sole criterion of responsibility when insanity is involved.
- (3) That the capacity of knowing right from wrong can be completely intact and functioning perfectly even though a defendant is otherwise demonstrably of disordered mind."

It was the above objection to the M'Naghten rules that led the United States Court of Appeals for the District of Columbia, to formulate a new criterion of criminal responsibility in the case of *Durham v. United States*. The court said that "the fundamental objection to the right-wrong test, however, is not that criminal irresponsibility is made to rest upon an inadequate, invalid or indeterminable symptom or manifestation, but that it is made to rest upon any particular symptom." In attempting to define insanity in terms of a symptom, the courts have assumed an impossible role, not merely one for which they have no special competence. As the English Royal Commission emphasizes, it is dangerous "to abstract particular mental faculties and to lay it down that unless these particular faculties are destroyed or gravely impaired, an accused person, whatever the nature of his mental disease, must be held to be criminally responsible." "In this field of law as in others, the fact-finder should be free to consider all information advanced by relevant scientific disciplines." The court then laid down the following test: "An accused is not criminally responsible if his unlawful act was a product of mental disease or mental defect.

'Disease' was used in the sense of a condition which is considered capable of either improving or deteriorating. 'Defect' was used in the sense of a condition which is not considered capable of either improving or deteriorating and which may be either congenital, or the result of an injury, or the residual effect of a physical or mental disease. The court made it clear that the concept of the act being a product of mental disease or mental defect was of the essence of its test. The court said that a jury should be told that if it believed the accused was suffering from a diseased or defective mental condition, but believed beyond a reasonable doubt that the act was not a product of such mental abnormality, it may find the accused guilty. The court also made it clear that in its opinion, it was still leaving the determination of the ultimate question of fact to the jury. "But in making such judgments, they will be guided by wider horizons of knowledge concerning mental life. The question will simply be whether the accused acted because of a mental disorder, and not whether he displayed particular symptoms which medical science has long recognized do not necessarily, or even typically, accompany even the most serious mental disorder."

Not the least of the advantages of the *Durham* rule was that it ended the "professional perjury" long decried by psychiatrists. To get around the unreality of the M'Naghten rules psychiatrists often find it necessary to testify the accused did not know that his act was "wrong" when the facts do not warrant that conclusion. This effect of the M'Naghten rules was severely criticized by the late Mr. Justice Frankfurter in giving evidence before the Royal Commission on Capital Punishment. "The M'Naghten rules were rules which the Judges, in response to questions by the House of Lords, formulated in the light of the then existing psychological knowledge—I do not see why rules of law should be arrested at the state of psychological knowledge of the time when they were formulated. If you find rules that are, broadly speaking, discredited by those who have to administer them, which is I think, the real situation, certainly with us—they are honoured in the breach and not in the observance—then I think the law serves its best interests by trying to be more honest about it. I think that to have rules which cannot rationally be justified except by a process of interpretation which distorts and often drastically nullifies them, and to say the corrective process comes by having the Governor of a State charged with the responsibility of the deciding when the consequences of the rules should not be enforced, is not a desirable system. I am a great believer in being as candid as possible about my institutions. They are in large measure abandoned in practice, and therefore I think the M'Naghten rules are in large measure shams. That is a strong word, but I think the M'Naghten rules are very difficult for conscientious people and not difficult enough for people who say "we will just juggle them". I dare to believe that we ought not to rest content with the difficulty of finding an improvement in the M'Naghten rules."

As welcome as the *Durham* test was, it has come in for severe criticism both from the bench, the bar, and the medical profession. The major objection to the *Durham* rule is that, in effect, it takes away from the jury the decision as to whether the accused should be held criminally responsible for his conduct. The test of criminal responsibility is, and must be, a legal test. It is for the jury, as society's designate in the administration of justice, to decide on the basis of evidence it has heard, whether the accused should be held responsible. Under the *Durham* test, if the psychiatrist testifying agrees that the defendant has a "Disease" and the act was its "product", then the issue is effectively taken from the jury. What is required is a standard of criminal responsibility that will allow psychiatrists to express themselves in terms meaningful to them, and yet will allow the jury to decide upon the basis of all the evidence whether or not the accused should be held responsible. A further difficulty with the *Durham* rule is the disagreement among psychiatrists as to what is a mental disease. Does it include all forms of psychosis, neurosis, and all states of psychopathy? The *Durham* rule gives no clear answer. The term 'mental disease' then can mean in any given case whatever the particular testifying psychiatrist says it means. There is clear disagreement among psychiatrists as to whether or not the various types of psychopathic conduct qualify as a mental disease. "This is not simply a matter of experts disagreeing on opinion or on diagnosis, which often occurs, but is disagreement at the threshold on what their own critical terms mean." These factors led Judge Burger, some seven years after *Durham* was decided, to remark in *Blocher v. United States* that "a term such as mental disease which has no fixed, agreed or accepted definition in the discipline which is called upon

to supply expert testimony is a tenuous and indeed dangerously vague term to be a critical part of a rule of law on criminal responsibility".

Another objection to the *Durham* rule is that the unlawful conduct must be a product of mental illness. Like the term "disease", the term "product" is inadequate. The idea of mental illness producing the criminal conduct repeats the error of the M'Naghten rules. Behaviour and mental illness are inseparable, they are two sides of the same coin. Clearly what Judge Bazelon had in mind was a causal connection between the mental illness and the criminal conduct. The reality of the personality, however, does not allow for such a simple link. Moreover, as Judge Burger pointed out in *Blocker*, "the fact that a criminal act can be the product of a mental disease should not *ipso facto* excuse the defendant; it should excuse only if the conditions described as a mental disease affected him so substantially that he could not appreciate the nature of the illegal act or could not control his conduct." The Royal Commission on Capital Punishment made the same point when it said, "There is no *a priori* reason why every person suffering from any form of mental abnormality or disease, or from any particular kind of mental disease, should be treated by the law as not answerable for any criminal offence that he may commit, and be exempted from conviction and punishment. Mental abnormalities vary infinitely in their nature and intensity and in their effect on the character and conduct of those who suffer from them."

In 1964, The American Law Institute published its Model Penal Code. The Model Code is a result of ten years of research and deliberation by the leading judges, lawyers, law professors, psychiatrists and criminologists in the United States. The drafters of the Code, while recognizing the need for a change in the M'Naghten rules, also rejected the *Durham* test. The drafters made particular reference to the ambiguity of the term "product". "If 'product' is interpreted to lead to irresponsibility unless the defendant would have engaged in the criminal conduct even if he had not suffered from the disease or defect, it is too broad: an answer that he would have done so can be given very rarely; this is intrinsic to the concept of the singleness of personality and unity of mental processes that psychiatry regards as fundamental. If interpreted to call for a standard of causality less relaxed than but—for cause, there are but two alternatives to be considered:

- (1) a mode of causality involving total incapacity, or
- (2) a mode of causality which involves substantial incapacity

But if either of these causal concepts is intended, the formulation ought to set it forth."

The drafters of the Code defined the proper question to be whether the defendant was without capacity to conform his conduct to the requirements of the law. The test adopted does not demand complete impairment of capacity. It requires *substantial* impairment thus recognizing the psychiatric reality of the situation. The complete test is as follows:

1. A person is not responsible for criminal conduct if at the time of such conduct as a result of mental disease or defect he lacks substantial capacity either to appreciate the wrongfulness of his conduct or to conform his conduct as a result of mental disease or defect he lacks substantial capacity either to appreciate the wrongfulness of his conduct or to conform his conduct to the requirements of the law.

2. As used in this Article, the term "mental disease or defect" do not include an abnormality manifested only by repeated criminal or otherwise anti-social conduct.

Under the Code test a psychiatrist will be free to testify unhampered by any artificial concepts. At the same time the essential question will be left to the jury. It will be for the jury to say, on the basis of all the evidence, whether the defendant lacked the substantial capacity to conform his conduct to the requirements of the law. If he did, then treatment not punishment is what is required, and a verdict of not guilty by reason of insanity is proper. It is well to emphasize that such a verdict does not mean that the accused is set free. Rather he is committed to an appropriate institution so that his illness may be treated with the hope that someday he might be returned to society.

In February of this year the United States Court of Appeals for the Second Circuit, perhaps the most respected and influential Court of Appeals in the United States, rejected the *Durham* tests and adopted the test laid down in the Model Penal Code. The Courts of Appeal for the District of Columbia, and the Third and Tenth Circuits have all used the Model Code draft as the essential basis for reformulating the M'Naghten rules in their jurisdictions.

OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE

This edition contains the English deliberations and/or a translation into English of the French.

Copies and complete sets are available to the public by subscription to the Queen's Printer. Cost varies according to Committees.

Translated by the General Bureau for Translation, Secretary of State.

LÉON-J. RAYMOND,
The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament

1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 20

WEDNESDAY, NOVEMBER 30, 1966

Respecting the subject matter of
Bill C-26, An Act to Amend the Criminal Code
(Safety Devices for Automotive Vehicles)
Bill C-49, An Act to Amend the Criminal Code
(Dangerous Motor Vehicles), and
Notices of motion Nos. 26, 31, and 38.

WITNESSES:

From American Motors Corporation: Mr. K. B. Raham, Chief Product Engineer; and Mr. W. S. Berry, Director, Technical Staff. *From Chrysler Corporation Limited:* Mr. G. A. Lacy, Chief Engineer and Director of Product Engineering; and Mr. R. C. Haeusler, Automotive Safety Engineer. *From Ford Motor Company:* Mr. W. Scott, Automotive Safety Director of the Car and Truck Division; and Mr. C. R. Briggs, Director of Safety Research. *From Kaiser Jeep of Canada Limited:* Mr. Roy P. O'Callaghan, Technical Manager. *From General Motors Corporation:* Mr. W. A. Woodcock, Chief Engineer; and Mr. K. A. Stonex, Executive Engineer, Automotive Safety Engineering.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1967

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS
Chairman: Mr. A. J. P. Cameron (High Park)
Vice-Chairman: Mr. Yves Forest

and

Mr. Addison,
Mr. Aiken,
Mr. Cantin,
Mr. Choquette,
Mr. Fulton,
Mr. Goyer,
Mr. Grafftey,
Mr. Guay,

Mr. Honey,
Mr. Latulippe,
Mr. MacEwan,
Mr. Mather,
Mr. McQuaid,
Mr. Nielsen,
Mr. Otto,
Mr. Pugh,

Mr. Ryan,
Mr. Scott (*Danforth*),
Mr. Tolmie,
Mr. Wahn,
Mr. Whelan,
Mr. Woolliams—24.

(Quorum 10)

¹Replaced Mr. Laflamme on November 29, 1966.

Timothy D. Ray,
Clerk of the Committee.

ORDERS OF REFERENCE

TUESDAY, November 29, 1966.

Ordered,—That the name of Mr. Cantin be substituted for that of Mr. Laflamme on the Standing Committee on Justice and Legal Affairs.

Attest.

LÉON-J. RAYMOND,
The Clerk of the House of Commons.

MINUTES OF PROCEEDINGS

WEDNESDAY, November 30, 1966.

(24)

The Standing Committee on Justice and Legal Affairs met this day at 8:20 p.m. in the Ambassador Auditorium of the University of Windsor. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Addison, Aiken, Cantin, Cameron (*High Park*), Forest, Goyer, Grafftey, Guay, Honey, Latulippe, Mather, Pugh, Ryan, Tolmie, Vahn, Whelan (16).

In attendance: From American Motors Corporation: Mr. K. B. Raham, Chief Product Engineer; and Mr. W. S. Berry, Director, Technical Staff.

From Chrysler Corporation Limited: Mr. G. A. Lacy, Chief Engineer and Director of Product Engineering; and Mr. R. C. Haeusler, Automotive Safety Engineer.

From Ford Motor Company: Mr. W. Scott, Automotive Safety Director of the Car and Truck Division, and Mr. C. R. Briggs, Director of Safety Research.

From Kaiser Jeep of Canada Ltd.: Mr. Roy P. O'Callaghan, Technical Manager.

From General Motors Corporation: Mr. W. A. Woodcock, Chief Engineer; Mr. K. A. Stonex, Executive Engineer, Automotive Safety Engineering.

The Clerk read the orders of reference pertaining to the automobile safety bills and notices of motion before the Committee.

After thanking Dr. Leddy, President of the University of Windsor for his kindness in permitting the Committee to use the University's facilities, the Chairman introduced the members of the Committee.

The Chairman then introduced the various witnesses present, and thanked General Motors and Ford for the valuable visits in the morning and afternoon respectively.

The meeting was then opened to questioning by the Committee.

Mr. Honey, on a point of order, suggested that in view of the many questions, and in view of the shortness of time, that questions be answered by the representative of the automobile industry, and that others comment only if they are asked or if they are specifically interested.

Following discussion,

*Agreed,—*That the procedure suggested by Mr. Honey be followed.

Mr. Whelan, on a point of order, suggested that the public be permitted to move closer in order to hear better.

Following discussion,

*Agreed,—*That the public be permitted to move closer.

At 9:15 p.m., the Chairman invited Mr. Forest, the Vice-Chairman, to assume the Chair.

Mr. Grafftey suggested that the various automobile manufacturers file with the Clerk, their budget figures pertaining to safety research. Mr. Stonex indicated these figures would be impossible to produce since budget figures are not, and could not, be broken down as Mr. Grafftey suggested.

Mr. Tolmie, on a point of order, suggested that Mr. Grafftey keep his supplementary questions as brief as possible in order to give other members a chance to ask questions.

Following discussion, the Chairman asked Mr. Grafftey to keep his supplementary questions as brief as possible.

Following discussion, on a motion by Mr. Honey, seconded by Mr. Mather,

Resolved,—That with respect to recalls by the automobile manufacturers for the years 1963, 1964, 1965, 1966, 1967, the U.S. automobile companies be requested to file this information with the Clerk of the Committee, and that the Canadian automobile companies file this information with the Clerk of the Committee as soon as possible.

At 10:20 p.m., the meeting adjourned until 2:30 p.m. Thursday, December 1966.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

WEDNESDAY, November 30, 1966,
Windsor, Ontario.

The CHAIRMAN: Members of the Justice and Legal Affairs Committee we have a quorum, and I will call the meeting to order.

This is a regular meeting of the Standing Committee on Justice and Legal Affairs of the House of Commons, and the ordinary rules of procedures which we follow in committee meetings in Ottawa will be followed here.

In order that you may better understand what we are doing here today, I am going to ask the Clerk of the Committee to read the terms of reference.

The CLERK OF THE COMMITTEE: Wednesday, March 30, 1966, Ordered,—That the subject-matter of the following Private Members' Bills be referred to the Standing Committee on Justice and Legal Affairs:

Bill C-26, An Act to amend the Criminal Code (Safety Devices for Automotive Vehicles).

Bill C-49, An Act to amend the Criminal Code (Dangerous Motor Vehicles).

Attest. Leon-J. Raymond, The Clerk of the House.

The CHAIRMAN: I would like, as the first order of business, to thank President Francis Leddy, President of the University of Windsor, for his courtesy, assistance and co-operation in making available the accommodation we have here tonight. We appreciate it very much. We appreciate the assistance which members of his staff have given to the Committee.

We also welcome very, very much, indeed, the members of the audience. We hope they can hear quite clearly, and that the proceedings here tonight will be of interest to you.

I am going to introduce the members of the Committee. On my left here is Mr. Yves Forest, the Vice-Chairman of the Committee; Mr. Perry Ryan; Mr. Ian Vahn; Mr. Eugene Whelan, whom I imagine everybody here knows; Mr. John Addison; Mr. Guay; Mr. Latulippe; Mr. Barry Mather; Mr. Cantin; Mr. Aiken; Mr. Pugh; Mr. Honey; Mr. Goyer; and Mr. Tolmie. These are all members of the House of Commons, and they are your representatives at Parliament because here you are elected to Ottawa you are not only elected to represent a constituency, but you are elected to represent the whole of Canada.

We have a distinguished panel of witnesses tonight. I have not yet had the opportunity of meeting them personally.

From the American Motors Corporation we have Mr. K. B. Raham. Would you please stand up, Mr. Raham; and also Mr. W. S. Berry.

From the Chrysler Corporation we have Mr. G. A. Lacy, Chief Engineer and Director of Product Engineering; and Mr. R. C. Haeusler, Automotive Safety Engineer.

From the Ford Motor Company we have Mr. Carl Purdy, Product Engineer and Mr. C. R. Briggs, Director of Safety Research, whom we had the privilege of having with us this afternoon; and Mr. W. Scott. We also had the pleasure of questioning Mr. Scott and getting answers from him.

From the Kaiser Jeep Company of Canada, Mr. G. H. Munro, Vice-President and General Manager; and Mr. Roy P. O'Callaghan, Technical Manager.

From the General Motors Corporation, Mr. W. A. Woodcock, Chief Engineer; Mr. F. M. Coffey; and Mr. K. A. Stonex, Executive Engineer, Automotive Safety Engineering.

Those are our witnesses tonight.

Our procedure will be to allow the members of the Committee to question these gentlemen. I am going to suggest, if I may, that the American Motors Corporation might answer the first question; the Chrysler Corporation Limited, the second; the Ford Motor Company, the third; and that Kaiser Jeep of Canada Ltd. and the General Motors Corporation indicate which of the members of their delegation they wish to answer the questions.

If that is not satisfactory, you may proceed as you wish, gentlemen, but we know that we are going to get a great deal of very, very valuable information from you.

In conclusion, may I express to the General Motors Corporation, to the Ford Motor Company and to their various officers, our thanks and appreciation for the proceedings so far today.

We visited General Motors this morning, and we saw demonstrations on their testing grounds; we saw a demonstration of a new safety bridge and we also saw moving pictures showing what happens when a car crashes, and so on.

At the Ford Motor Company we saw, in slow sequence, pictures of what happens when a car travelling at 20 miles an hour meets an immovable object.

We also had the benefit of a long panel discussion with members of the Ford Motor Company.

All of this has been very beneficial, and all of it was very interesting.

At a later stage in the proceedings I am going to ask my Vice-Chairman to assume the Chair while I sit down and relax and enjoy myself.

Without further ado, we will carry on with our proceedings. I think I saw Mr. Addison's hand go up to ask the first question, followed by Mr. Aiken and then Mr. Ryan.

Mr. ADDISON: Mr. Chairman, I asked Mr. Scott this question this afternoon *in camera*. I would like to ask it again in the Committee, and I would like to ask it of each one of the individual automobile representatives.

The question is this, and I will frame it much as I did this afternoon. Quite obviously the automobile manufacturers are doing everything they can to bring about a safer vehicle. It is a crash program, and I think they admit this fact. It has been suggested that perhaps this should be taken outside the area of competition; that the principal automobile manufacturers in North America should pool their resources and establish a non-partisan organization in order to speed up research on safety equipment in automobiles. I also understand that the

decision taken by the representatives in the United States was that free competition would serve the purpose better than having the manufacturers group their safety organizations together in one unit.

I have been told that perhaps the Justice Department in the United States would not approve of the automobile manufacturers grouping together in this type of effort.

Would the automobile manufacturers consider setting up this type of organization in Canada—a Manhattan project on safety in Canada—sponsored and staffed on a non-partisan basis by the various manufacturers, to produce and accelerate safety equipment which can be brought forward and put on 1967 and 1968 automobiles?

Mr. W. SCOTT (*Automotive Safety Director of the Car and Truck Division, Ford Motor Company*): I think that is a very appropriate question. As I indicated this afternoon, I personally, have many doubts that a co-operative venture among the many manufacturers towards safety research would be as productive as it would seem to be at first thought. We, of course, have been trained to be so competitive that it is difficult for us even to think in these terms. As you know, most of the laws that govern us are prohibitory in nature—thou shalt not discuss prices with General Motors, and so forth—so that we are very chary of alliances with our competitors.

I think the suggestion that there be a facility in Canada, where the law does not prevent this type of combination, should be considered in terms of the facility problem that we would have. Each of us, as you know, has multi-million dollar test facilities located in our various organizations. Our activities at Ford, for example, are quite interdependent; we do not have the same facilities in each building, and so forth, because we take advantage—it is almost like a college campus—of our total facilities for the use of all of the research activities.

I would visualize serious problems, in the establishment of adequate facilities with adequate equipment, of duplicating what we already have; I would be very concerned with what I consider a serious management problem on who would direct the research; I would be concerned, too, since the various companies make products that have such different attributes, that we would have differing degrees of interest in certain types of research. For example, one of the companies largely produces unitized construction bodies; another company largely produces bodies for frame-type cars. Working in crash research, for example, yields entirely different answers when one deals with unitized bodies versus frame cars. I can visualize a serious problem in agreements being reached with regard to the contribution of funds among the three to fund a joint effort.

One might ask whether we should split it equally; whether we should contribute in terms of our respective market shares, or our respective profits or losses, whatever the case might be.

In total, I can only sense that a careful study would raise enough questions to create a real doubt in my mind that a common research would be more productive than the competitive urge that each company has to outdo the other and, in effect, to turn to the safety front the same kind of competitive strengths that have created the very companies that now survive in this terribly competitive industry. Therefore, I for one, would say that my initial response would be

that, although it is a worthwhile suggestion, I can visualize serious problems of implementation and that I truly doubt that the cause of safety would be advanced beyond that which each company working alone could produce.

Mr. ADDISON: Mr. Chairman, may I ask Mr. Scott if that is a personal opinion, or is it a company policy?

Mr. SCOTT: I have to explain that is a personal opinion. The question has just, in effect, been asked of me.

Mr. ADDISON: I asked it of you as a representative of your company. You are here as a representative of your company, are you not?

Mr. SCOTT: I am here as a representative of Ford U.S. and I am delighted to have the opportunity to be with you.

I would suggest that if you wish to make a formal inquiry it would be most proper to do so of the Ford Motor Company of Canada. We would, of course, be in discussion with them on the matter.

Mr. G. A. LACY (*Chief Enigneer and Director of Product Engineering, Chrysler Corporation Limited*): In practically all respects I agree with Mr. Scott in what he has said, but I would like to emphasize to the Committee that there is a high degree of co-operation in the engineering trade in the automotive industry. The Society of Automotive Engineers shares its experiences and shares its research results most extensively. On the SAE committees sit the representatives of certainly all the automotive manufacturers plus tire manufacturers and all sorts of companies who are in any way related to the automotive trade.

I think it would be a mistake on the part of the Committee to think that this is an entirely closed shop, technologically, one company to another. For instance, going beyond the SAE there is the co-operative research committee which is the oil companies combining with the automotive companies on mutual problems and to go through mutual research. But this group has no facilities of its own. All of the research and development work is carried out at the research and laboratory centres of the co-operating companies; and the committees will establish priorities of work to be done, standards to be set and this work will be carried out by the committee members in their own shops. I think it should be understood that there is already a high degree of co-operation in engineering.

Mr. ADDISON: You are representing your company and your company policy is such as not to suggest that a co-operative venture in Canada into safety research would be practical. Is that your company's position?

Mr. LACY: I have not had a mandate from my company on that question. It has never come up. I think it would be unfair for me to express an inviolable comment on it; but I think I could say that it would almost assuredly be the way Mr. Scott has expressed it. We would not think, as a corporation, that a combined research activity toward safety, or any other thing would necessarily end in a positive result, any more than medical research in all the universities should be pooled into one place, where you have one director, and one line to follow, as it were. I think you will find that medical research goes on in many areas, in many divergent ways, and the results of this are that some are successful and some are not successful; but the successful ones eventually get into the common field of understanding and are usually followed.

Mr. K. B. RAHAM (*Chief Product Engineer, American Motors Corporation*): I think I have very little to add to what the two previous speakers have said.

There are great facilities, of course, in the United States and to try and duplicate in Canada what is being done where our cars are basically designed would certainly pose a serious financial problem to the Canadian counterparts of the industry.

Currently, we have Canadian engineers who spend a fair amount of time in the United States at the safety laboratories co-operating with them as certain problems may relate to conditions in Canada; so that already we have co-operation between companies across the border, but not necessarily between competing companies except, as Mr. Lacy says, where we co-operate through the Society of Automotive Engineers and various other engineering organizations, where there is a great sharing of wealth of design and test results that we have obtained.

Mr. ADDISON: Is that your personal opinion, or your company's position?

Mr. RAHAM: Well, there again, I do not know that this question has ever come up through the company, but I think I can speak relatively clearly for the company in this regard. I would not want to commit my company to what I am saying here tonight without further consultation with them, but certainly I have been with the company, I think, long enough to understand how it works, and I think I am fairly accurate in this answer.

The CHAIRMAN: Would Mr. Munro, or Mr. O'Callaghan, like to make a comment on the question?

Mr. G. H. MUNRO (*Vice-President and General Manager, the Kaiser Jeep Company of Canada*): Mr. Addison, I do not think we can say very much more than what has been said. We are also in a position where I could not speak, personally, for my company, as a matter of policy.

I think that the points which have been brought out are very clear to anyone who is associated with this type of project.

The automotive industry, at the moment, makes considerable grants to universities for research, and I do not think this should be lost sight of in the overall picture. This is something which Mr. Lacy was drawing attention to in the medical field; and I do believe that competition is the first prime point at which we should look, and the facilities that you would require to carry out such a project in Canada.

Mr. PUGH: May I ask a supplementary question? You have stated that you have research association. I am wondering whether, at the federal level in the United States, there is any organization with which individual companies file the results of the safety work which you are doing by yourselves? Is there any law which demands that you file with such an association, and, if so, have they any published literature on the subject?

Mr. R. C. HAEUSLER (*Automotive Safety Engineer, Chrysler Corporation Limited*): Gentlemen, the question is whether we have any requirement to file the results of our research or our engineering. There is no requirement. There is a regularly constituted practice whereby we distinguish, of course, between research and engineering. The research results are very readily pooled. The

engineering results which are, in effect, the development of vehicles in a competitive market, are quite proprietary, and so we separate these.

The basis for this application work of safety principles is indeed widely promulgated. It is widely distributed through channels such as the papers of the Society of Automotive Engineers; it is distributed through our participation in the staff conferences on car crash technology and car crash research; the papers of the American Association of Automotive Medicine; and our participation in the American Medical Association's Committee on Medical Aspects of Automotive Safety. Through these various channels we do, indeed, distribute the results of the research part of our work, but engineering is not distributed except in so far as it describes accomplishments, for example, through the Society of Automotive Engineers technical papers.

The CHAIRMAN: Thank you very much.

Can I now have a spokesman from the General Motors Corporation?

Mr. W. A. WOODCOCK (*Chief Engineer, General Motors Corporation*): I think the spokesmen from the other companies have said just about all there is to say on this subject.

All I can perhaps add is that it is a competitive industry, and that General Motors want to keep it this way; I feel, and I am sure the company feels, that lack of competition would not be productive in terms of more safety.

I think, too, we must realize that the major part of the engineering of the industry lies in the U.S., and that this is just a fact of life.

The CHAIRMAN: Thank you very much, Mr. Woodcock. I think Mr. Addison has another question.

Mr. ADDISON: I have just one more comment. It is evident I think, now, to the Committee that the gentlemen before us are not authorized to speak about their companies' policy decisions, in connection with a major undertaking such as this.

I would like to bring that to the attention of the Committee.

Mr. LACY: Could I comment on that, Mr. Chairman?

The CHAIRMAN: Yes, certainly, Mr. Lacy.

Mr. LACY: I think it would be most unfair to ask any group of people from an industry to promulgate new policies which have never been thought of before. I do not think that even the presidents of our companies, would, without consultation with their boards of directors, come up with completely new policies which have just never been discussed.

I do not think that it is fair to say that we are not competent to speak in the realm of the activities which we have been asked to discuss.

Mr. AIKEN: Mr. Chairman, I would like to ask why so many vehicles have been recalled this year for safety checks. There seem to have been more in the last few months than there were previously. I wonder if we can have an explanation whether this is because there is more care on the matter, or is it merely that these shortcomings have been discovered by more careful research?

Mr. RAHAM: Mr. Aiken, I believe that call-backs, or car campaigns, have always gone on. They are not new to us, and I am sure that they are not new to

any of the other automotive companies. Of late, however, they have become more public, and I think the public is more aware of these than they ever were before. Certainly, call-backs have been going on for years and years, and many of them—in fact, probably the greater majority—do not concern safety. They might concern such things as a better-operating heater, to produce more heat in the car, which, in turn, is really for the driver's comfort.

I do not think that there is any increase in call-backs at this time over what there ever has been; but they are certainly more public now.

Mr. AIKEN: I would take it from that, that it is really a case of more public interest and more reaction when a group of vehicles is recalled?

Mr. RAHAM: Yes, I would say that is true.

Mr. AIKEN: I wonder if any of the other people could tell me whether there have actually been more recalls in 1966 than in previous years?

The CHAIRMAN: Mr. Woodcock, would you like to answer that?

Mr. WOODCOCK: No, I cannot answer that, specifically, for the industry. I was going to comment on the earlier question of call-backs.

I think there is quite a misunderstanding of what this call-back may mean. For instance, in some instances we have some had wrong serial numbers on trucks. This could appear to be a call-back procedure. The owner, or customer, is in no danger because he has a wrong serial number. I am not suggesting that they are all this way, but many of them are and these add to the numbers; and I think that numbers in themselves might be meaningless.

Another instance is that perhaps find we out that we have put 15 wrong generators in 4,000 cars. We have to call back all 4,000 cars just to find the 15. Numbers can be meaningless in this context.

Mr. K. A. STONEX (*Executive Engineer, Automotive Safety Engineering, General Motors Corporation*): I would like to comment that under current legislation in the United States we are required to file notices with the Secretary of Commerce on any call-backs and, further, that the industry in the United States, in response to a request from Senator Rubicoff, gave a list of all the call-back campaigns for the last six years or so. A little bit of confusion exists between those that have been called back on 1967 models and the number that have been called back during the past five or six years.

I do not know anything about the numerical comparisons over the years, but the program is no different this year from it has been in the past except that we are obliged to file these with the Secretary of Commerce. The foreign manufacturers, the import people, have also, on a voluntary basis, filed reports of call-back campaigns. Thank you.

The CHAIRMAN: Would one of the representatives of the Ford Motor Company care to add anything?

Mr. SCOTT: I cannot add much, Mr. Chairman. I join in the comments of the others. I think there has been a rather sensational press reaction, and perhaps, a public misunderstanding, in connection with these call-backs. I am not acquainted with the reporting that took place here in Canada. It was not too well handled in the United States with regard to some of the facts. The

general impression was given that a great number of dangerous cars were on the highways, and the government was saying publicly that this fact existed and, therefore, that it was aiding and abetting the cause of safety.

The facts are really quite the opposite. Every person who has purchased any car from any of the manufacturers, about which there was any suspicion of a defect, had been notified of it by registered mail as much as several months earlier than its revelation. I would put it this way, that at the point in time that these recall campaigns were made public in the United States the only people who did not know about the campaigns were those who did not have the cars with the suspected defects.

I wish to emphasize the point made by Mr. Woodcock, that it is often necessary to recall what sounds like an enormous number of vehicles to trace a known quantity of small defects.

I would like to cite a similar example. I understand that a campaign was conducted here in Canada with regard to a number of Ford trucks which were described in the newspapers as having defective brakes.

The facts are very simple. In the course of truck assembly in one of our plants a worker was crawling through a truck. He caught his foot under the brake pedal and as he pulled it out and exerted considerable pressure he disengaged a push rod from a master cylinder. This should not happen even under such unusual circumstances, and we examined it immediately and found that it had to do with some little retaining rings.

We immediately checked with our vendor who supplied these and we found that a small lot of these retaining rings had been mistreated in heat treat; they were brittle. Our vendor did not know how many he had sent to us; we did not know how many we had received; we knew that the lot was a single lot from only one of his plants; yet we decided that we would campaign every single light truck that had been made from job one until that date.

I am confident that we do not have more than a 2 or 3 per cent problem, but the numbers sound enormous. I state this only so that you understand the extent to which we will go to identify and isolate the suspect units in which there may be a potential defect.

I should further add that the likelihood of the separation occurring in use was very slight; in effect, it would require a person to reach the brake pedal with his hands and tug with far more power than most of us would have in that position to have it even occur.

We went ahead and did this, and we always do things like this. We did them before a safety act and we do them after the safety act. The difference is that there is now a public announcement made, and in what I consider to be an unfortunate way the public is lead to believe that the total number of units being inspected is actually defective, and that is not the case.

Mr. AIKEN: May I ask just one more question on that subject, and then I will give up the floor.

We read in tonight's newspaper of the 23 safety standards set down by the United States Administrator of the Highway Safety Act. I would merely like to ask whether the industry will meet these auto safety standards for the 1966 models?

Mr. WOODCOCK: I do not think we have the standards yet, Mr. Aiken. The standards have not been promulgated even in the press.

They have indicated the areas in which the standards will be written, and they will cover these areas, but I do not believe the standards have yet been established. I would say that if the standards are reasonable they likely will be met.

Mr. AIKEN: There is time, if the standards are what you expect then to be, to include them in the 1968 models?

Mr. WOODCOCK: Yes; this is our hope.

The CHAIRMAN: Mr. Munro, or Mr. O'Callaghan, would you like to make any comment?

Mr. MUNRO: On the last question?

Mr. AIKEN: Yes.

Mr. MUNRO: No, I do not think we can add much.

On the last supplementary question that was posed Mr. Aiken, it is our understanding at the moment that what Mr. Lacy has said represents the true picture.

On the question of recalls I think that we in the industry are sufficiently aware of the fact that this is not something new; that this is something which has a history to it; and that it is a question of public awareness, of more press notice. I, for one, do not believe that is a bad thing. I am not suggesting that. I think, in the long run, that it is probably a good thing; but it is important to get the numbers in their true perspective.

Mr. HONEY: Mr. Chairman, on a point of order. I wonder if I could make the respectful suggestion that we might move ahead more quickly if you, as Chairman, sir, would agree that perhaps a representative would answer a question and only if other representatives do not concur in his answer, do these others comment? Otherwise, I am afraid that we are going to have a lot of repetitious answers.

The CHAIRMAN: The questions which have been asked up till now have been general questions and I thought that all the representatives might want to state their position in regard to them.

However, we can probably follow that procedure.

Mr. WHELAN: Mr. Chairman, on a further point of order. I understand that there are complaints from the press and from some of the members that they are not hearing too well; the audience is not hearing the witnesses and they are not hearing the questions which are asked. If they so desire, Mr. Chairman, I think it would be in order to allow them to move closer. Perhaps, also, those who are asking and answering questions would identify themselves more clearly, because they are not getting through.

The CHAIRMAN: I think that is also an excellent suggestion.

Mr. WHELAN: Because in the Committee meetings in the House of Commons they are much closer to us.

The CHAIRMAN: If the people at the rear of the hall would like to take advantage of this we will ask you to move closer around the table so that you can hear better.

Mr. GRAFFTEY: Mr. Chairman, may I ask a quick supplementary question of Mr. Lacy?

The CHAIRMAN: Mr. Grafftey has a brief supplementary, and then Mr. Ryan will ask questions.

Mr. GRAFFTEY: In your dialogue, Mr. Lacy, you used the expression that you could comply with the regulations if they were reasonable. Is my impression not correct that the regulations that Mr. Haddon is going to announce will be the law of the land, and that there will be no question of anyone's interpreting whether they are reasonable or not?

Mr. LACY: If that is your position, Mr. Grafftey, why ask the question? If it is the law, we must, so why ask?

Mr. GRAFFTEY: No, I am asking you the question. You made the statement Mr. Lacy, that you will comply if they are reasonable. Are these regulations not going to be the law of the land? That is what I am asking you.

Mr. LACY: If they make it the law of the land that cars will have to fit a person 10 feet tall I do not think we can meet it.

Mr. GRAFFTEY: Who will be the judge of whether these standards are reasonable or not?

Mr. LACY: You are really asking me to speculate on something which has not been promulgated. Perhaps Mr. Haeusler can tell me when they will be promulgated.

Mr. HAEUSLER: The proposed standards will be available tomorrow, at the end of the day at the latest, but the final standards for effect will be published on January 31, 1967. The publication tomorrow is for comment.

Mr. LACY: You see, after tomorrow the industry will get back with Mr. Haddon and say: "Mr. Haddon, this is reasonable to us; this we cannot meet by then." What comes out on January 31, will determine whether or not we meet them. I cannot speculate on them at this point.

Mr. GRAFFTEY: Therefore, if you convince Mr. Haddon that his regulations are not reasonable he will relax them to suit you?

Mr. LACY: You would have to ask Mr. Haddon that, Mr. Grafftey.

Mr. RYAN: Mr. Chairman, I think we learned today, as a result of our visit to G. M. and Ford, that there are two areas in a motor vehicle in front of the driver or occupants that can lessen the severity of an impact. The first area is between the bumper and the front of the engine block and the second area is between the engine block and the fire panel or footboard of the car.

Let us consider these areas. I was wondering if there is any material that is recognized today as best for energy-absorption, which could be put into these areas, and also if there are any publicized studies on basic energy-absorption.

The CHAIRMAN: Who is going to undertake to answer that question?

Mr. RYAN: Mr. Scott was in that area this afternoon, but I hesitate to—

The CHAIRMAN: Mr. Stonex has stood up.

Mr. STONEX: There are a few studies showing the amount of energy-absorption in the front end. These were done by Lundstrom and Calais at the sta-

conference in California two or three years ago, and in a paper before the Canadian Highway Traffic Association in Toronto two years ago I gave these figures.

In a later paper by Mr. L. C. Lundstrom, who is the director of automotive safety for General Motors in Los Angeles, at the SAE meeting last August, he showed that, because of the sequence of events, the car has already stopped before a passenger collides with the instrument panel; that is, in the speed range, from what I could observe, of 25 to 65 miles per hour the collision is all over before the unrestrained passenger touches anything.

The only hope that I can see is if we can devise restraint systems which are taut and snug and will begin to decelerate the occupant practically at the moment that the car begins to decelerate.

I can quote you, and I have used, the results of Fredericks of Ford, which show that belted dummies in an automobile do not begin to develop load in the seat-belt until the collision is over, and these are the conventional lap belts. It is not, in our opinion, of any avail at all to consider very much more concern about energy-absorption in the front end of the vehicle until we have developed restraint systems which tie the occupant to the vehicle very effectively, so that within 10 seconds instead of within 50, he begins to get some load in the seatbelt.

This is a subject of deep concern and interest, and I can assure you that the experts in all of our industries are studying this very carefully. It is not a simple, pen-and-shut case.

Mr. RYAN: Is there no known material now that would fill either of these areas?

Mr. STONEX: It would not make any difference, you see. If I run into a tree and the car stops before I strike the instrument panel, how the car stops is of no importance at all. What is necessary is for me to have a restraint system that ties me to the car so tightly that I begin to slow down as the car begins to slow down.

Mr. RYAN: This would be of primary assistance but would not the other be secondary assistance? Would it not lessen the severity of impact, particularly speeds over 20 miles per hour?

Mr. STONEX: In all the tests that we have seen the car has already stopped before the occupant collides with the instrument panel. With our energy-absorbing column, where we do not have quite as much distance to travel, there is a possibility, but the sequence of events is such that, generally speaking, as we know it now, in this 24 inches or so of front end collapse, the rate at which this happens even the force-time-distribution curve is not of significance.

Mr. RYAN: You still have not said anything about anything having been published on this type of depressive material—that is, material that would compress but would not spring back?

Mr. STONEX: We have material which compresses and which does not spring back. We have such materials in our conventional designs. If we take a conventional car and a car with the front end sheet metal bumper stripped off, we find that the conventional car absorbs energy at a slower rate; it stretches out the duration of the collision by something like 20 per cent; it always lags behind the stripped car in distributing energy, by an amount of something like 20 per cent

of the total energy. But, as I said, this is a matter of no importance at all, because the car stops before I collide with the instrument panel. We need better restraint systems.

Mr. RYAN: Would a compressive material between the fire panel and the motor block not be of some assistance in reducing the severity of injury?

Mr. STONEX: We have not seen, in all of the crash impacts we have run—which include 50-mile-an-hour barrier deaths and 60-mile-an-hour tree deaths—any indication that the motor block comes back into the passenger compartment to an extent which is dangerous or harmful.

Mr. RYAN: That is at lower speeds.

Mr. STONEX: Up to 65 miles an hour, with direct impact on a tree. We do not know many of these answers and we as I have said—and as I am sure are all of our colleagues—are working very diligently in this area. You may rest assured also, that whenever we find out something which can be useful we will adopt it immediately.

Mr. RYAN: I thought it was around 35 or 40 that we had trouble with the blocks coming back.

Mr. STONEX: Not to the best of my knowledge. Perhaps someone else knows of other experiences, but we do not have it in our research.

Mr. WHELAN: Mr. Chairman, can I ask a plain supplementary of the gentleman who has just spoken?

Do you mean metal that has flexibility is no better in an automobile than very stiff metal? Is there no safety factor in having metal that will compress against a really stiff metal?

Mr. STONEX: In the range of severity which I am discussing, which covers, say, the speed range of 25 miles an hour to 65 miles an hour, in solid impacts on barrier or a tree, the difference in detail of construction of the front end does not appear to be important.

I have heard it reported by some of my colleagues, who have done some early computer work, that existing cars with the conventional front end design are about 80 per cent of ideal in terms of the energy-absorption and the distribution of energy-absorption during the collision. I cannot verify this, but I have heard it reported.

Mr. WHELAN: I have one more question.

Can you explain why it is that a collapsible steering wheel, then, is of some utility?

Mr. STONEX: If I strike it during the last 8½ inches of travel forward, no energy is being absorbed over this considerable distance; without it, it is absorbed in whatever deformation I can do to the steering wheel rim. In essence, then, this lengthens the duration of the second collision by an appreciable amount.

The CHAIRMAN: I think Mr. Haeusler wants to say something.

Mr. HAEUSLER: Mr. Chairman, I think this is a very appropriate and searching line of questioning and the point is well taken that this energy-absorbing steering column does demonstrate the method of absorbing energy by a ve

effective substance—sheet metal. The major absorption is occurring in these instances in the accordioning of the jacket around the column, forming into accoridian pleats, as it were, and the bending of metal which does not spring back; and this bending is indeed accompanied by a very substantial amount of absorption.

An hon. MEMBER: This is the same compressive material?

Mr. HAEUSLER: This is excellent material, yes. We have done considerable work in this area, comparing organic materials—elastic and relatively rigid foams—with the sheet metal, and the sheet metal looks very competitive, very appropriate in terms of its effectiveness in absorbing energy.

I would like to add, by way of comment on another point raised, that we, too, have been looking at the cases brought to us by the Cornell Crash Injuries Research Program—actual highway accident cases—and find no basis for this apparent popular concern that the engine will come back into the lap of the front seat occupant, or something of this sort. This can, indeed, happen; it has happened; but the point is that in such instances as it does, this represents the utmost extremity of accident. This is why it makes such sensational press material. It is because it is quite exceptional, rather than being the manner in which so many of our people are being injured or killed.

The CHAIRMAN: Thank you very much, Mr. Haeusler.

I am now going to ask Mr. Yves Forest, the Member from Stanstead in Quebec, to take over as Chairman.

Our next questioner will be Mr. Grafftey from Brome-Missisquoi.

Mr. GRAFFTEY: Gentlemen, I will make my questions as brief as possible. I am afraid—with my apologies to my colleague, Mr. Honey—that perhaps a spokesman from each of the companies here will have to try to answer this.

Gentlemen, I will not, as did Mr. Kennedy in the U.S. hearings, ask you about the profits of your corporations, because I do not think that is what we are here for; but within reason—and I know it is a hard thing to measure—could you tell us what your budgets for safety research were in 1965, and what your budgeting for direct safety research in 1966?

While you are commenting on, or possibly giving us, these figures, could you tell me whether, in your view, and from your dialogue with other executives in the industry, it is now recognized that this year there has been a decline in vehicle sales and whether, in your opinion, you feel that this is because the public are now demanding more safety in cars, and that finally safety will sell?

These are the two questions that I would ask—whether or not you could give me your comparative figures for safety research in 1965 and 1966, and whether, in the view of the industry, the public's reaction shown in declining sales does mean that safety will finally sell?

Mr. LACY: Taking the last question first, I do not think that I am in a position to say why, if they are in a particular company, car sales are down, or why sales for the industry as a whole are down.

I think you will find very little agreement amongst economists on why the market in any commodity is up or down, or why the market as a whole—the stock market, for instance—is down. I read about it every week and I find such expressions as “tight money” and many other things. Tight money seems to be

the whipping boy for all market declines right now. It certainly has an effect in the sale of cars, because cars are bought in large measure on time payments, and if you cannot borrow money to buy an automobile it certainly will have a strong effect; and I would think that this has a far greater effect than any of the other considerations that you suggest.

Mr. GRAFFTEY: Perhaps I would better understand the pressure which you gentlemen have been operating under if you could file the information on expenditures with the Committee, if you feel that it would not take too much time. If you have it readily available now we would like to hear it. If not, this information on the relative budget expenditures for safety research in 1965 and 1966, could be filed with the Clerk of the Committee later on.

Mr. STONEX: Mr. Chairman, the amount of money which is budgeted or spent is really begging the question. You saw the facilities today at the proving grounds; and you saw a barrier impact test.

After you left I saw a memorandum to the effect that the test crew is 40 tests behind on one of the facilities and 20 on the other. It is not a matter of money, at all. It is a matter of trained people.

Today you saw probably two-thirds of the competent crash researchers in the whole wide world, and tomorrow you will see the other third. If we had spent ten times as much money on crash research we simply would not have the trained people to do the work. Therefore, this is beside the point, to a large extent.

Mr. GRAFFTEY: What I would like you to say, sir, in my cross-examination—and if you feel it is unjust I would like you to say so—is that I, as a layman, have had the feeling that although you people who are so sincere are very often doing a good job in terms of safety engineering, the job that you have to do on those proving grounds has been severely hampered and limited by the dictates of styling and that that has already overruled a great deal of the significance of what we saw going on there today. The stylists have already had their way and the marketing people have already had their way by the time the vehicle has been put in your hands for test on the proving grounds. That is why I want to know the figures for pure research, independent of styling or marketing considerations.

Mr. STONEX: I cannot give it to you, and I am sure that the estimate of \$19 million given to the Congressional Committee last summer is a value which was estimated by assuming certain developments in brakes for safety and certain developments for something else. These are intangible figures. I cannot even tell you how much of my salary ought to be budgeted for safety, if any, nor those of most of my colleagues. This is an indefinite and intangible figure.

Again I want to repeat that the people who are qualified to do this work number in the fifties in the whole world. We are training others as rapidly as possible, and I am sure our colleagues are—because this is the limitation—qualified people.

Mr. GRAFFTEY: Before I ask my next question, I would simply say that we will not get into a dialogue on figures now, but if figures can be filed with the Committee I think they would be very helpful.

I would like to ask a few questions of Mr. Haeusler of Chrysler Corporation, but before I do so, Mr. Haeusler, I would like to compliment you on being one of the executives in the industry who, in my view, have made a great effort in this respect.

Mr. HAEUSLER: Thank you, Mr. Grafftey.

Mr. GRAFFTEY: Mr. Haeusler, in your view, do you feel—and this is a very difficult field—that the motor vehicle industry, in general, in North America has over-emphasized power in the vehicles to the detriment of safety considerations?

Mr. HAEUSLER: No, I do not believe so, if by that you mean power in design, or consideration of power available in the designing or choosing of engines.

There may, indeed, be questions raised with regard to the manner in which advertising has presented this subject, and we are constantly sensitive to this subject, and appropriately so. We need to be. We are creating appeal with regard to "lively" cars. I think we have to be quite careful, and continue to be careful, that we are not suggesting irresponsible use of these cars.

We are well aware of the results of irresponsible use. We are well aware of the fact that a sharp knife can, indeed, cut, and we are not about to dull the knife. However, with regard to engineering choice, I do not think we have made any mistakes. It is not a question of one or the other. We have made the point repeatedly that higher power can, indeed, be used wisely and as a safety mark; it has also been used unwisely, we know.

Mr. GRAFFTEY: Mr. Haeusler, I am not going to put you "on the spot" and ask you any question different from the one I will ask the spokesman for G.M. and Ford today, but as a man who is deeply involved with safety engineering of vehicles have you often felt in the past that your recommendations to your company relating to safety engineering have been compromised, and at times nullified, by considerations of styling and marketing?

Mr. HAEUSLER: I am sure that to a degree they have, in the sense that all of these considerations are brought to bear in the final choice of product—a product which must be presented to and sold to the driving public.

I am sure that if safety were the only consideration the vehicle would, indeed, be different, and look different to some extent. There has, indeed, been a juggling together of these several considerations, with no one being the sole basis for determining what is to be sold. I think this is true.

Mr. GRAFFTEY: Can I, as a legislator—and I am not asking you to make public testimony at this time—assume that when you have dialogue with your superiors in advertising and marketing, men in your position would take serious objection to some of the industry's advertising over the past years, especially as relating to the names of the vehicles?

Mr. HAEUSLER: I have taken no personal exception to the choice of names, nor do I feel inclined to. I think that these are whimsical, at the very least. We have had no indication—not even a modest indication—that naming a car a Fury is or something else that results in less responsible use as contrasted with calling the car a somewhat more neutral name.

Mr. GRAFFTEY: Do you think that calling a car Fury, a Mustang or a Thunderbird inculcates safety in the public's mind?

Mr. HAEUSLER: I doubt very much that it has any effect, one way or the other. I do not really believe that it has had any measurable effect. This has been a discussion topic, I realize, and I realize we cannot prove it one way or the other. There has been no basis that has caused me any concern, frankly.

The VICE-CHAIRMAN: Mr. Whelan, on a supplementary.

Mr. WHELAN: What about the word "Imperial"?

Mr. HAEUSLER: Mr. Whelan, if I could make a whimsical remark, I do not think it is going to cause the downfall of the republic, anyway.

Mr. GRAFFTEY: I would like to continue the same line of questioning, very briefly, with you, Mr. Scott, and ask if, in your view, we have over-emphasized the powering of vehicles in terms of safety?

Mr. SCOTT: No; I agree with Mr. Haeusler. You can take a 1.3 engine in a Volkswagen and drive at 75 miles an hour and, upon hitting anything, I am quite sure that there is a fatal accident. Whether or not the engine reserve power North American size car is greater than 1.3, and so forth, is quite immaterial. It is the manner and the use.

This is a rather old saw. I spend an awful lot of time on the telephone talking to others in the United States, who call me up and ask me similar questions. You probably know Jeffrey O'Connell. He likes to call me, and he always asks me about the names of the cars. I have probably spent \$100 on the telephone with him, and he keeps asking the same questions; so that I am just not going to talk to him any more. I say essentially what Mr. Haeusler has said.

If a car is about to hit a tree, whether it is called a Lincoln or a Mustang you are in trouble. I do not care what the name of the car is.

I do not think we have over-powered the cars. We offer a variety of transportation, Mr. Grafftey. We cannot make a single car for everybody here any more than I can make one suit to fit all of you. It is expensive to design different types of cars. We do so because there is a public interest in different kinds of cars that do different things, at different prices, with different kinds of ride, with different levels of convenience and luxury, and we respond to that. The one equation that is a constant is our interest in providing the safest possible transportation for that size and shape of vehicle.

Mr. GRAFFTEY: Mr. Scott, would you give your title with your company to the Committee?

Mr. SCOTT: I am the Automotive Safety Director for the North American Car and Truck Group; that is a corporate position.

Mr. GRAFFTEY: Do you find, Mr. Scott, that very often your recommendations to senior management are nullified or compromised by styling and marketing considerations, to the extent that you feel frustrated?

Mr. SCOTT: I am delighted to have the opportunity to answer this question. The answer is no. I am a member of the Engineering and Product Planning Committee, which is advisory to Mr. Ford, on the approval of all product programs. I am also a member of the Styling Committee, which is advisory to Mr. Ford, on the approval of the appearance of all new model programs. I have been the Automotive Safety Director for a relatively short period of time. I have

had an interest in safety and have spoken for safety as a member of these committees. Before I was in this position I was the vice-chairman of the Product Planning Committee, and I have spoken for safety for years in this group. I have not had a whimsical reversal attitude among the members of the management of our company. I am delighted to say that the principals of our company are as interested as you in the furtherance of automotive safety.

I may further add—and Mr. Haeusler has said it well—that you do not make a car to satisfy one buying attribute alone. Cars are bought for different reasons. Some people want a car to commute; some people want a station wagon for trips, and so forth; and cars must satisfy different kinds of people who put different values at different points in time on different attributes. Some people want “ride”. We went through a period when people wanted power, and perhaps industry over-emphasized in its advertising of power back in the middle 1950’s. We went through rather interesting periods in appearance of vehicles, such as in the days of the fins, and so on.

Today, we find—and we are delighted to report—that the buying public both in Canada and in the United States—I am talking about our North American cars, now—is ascribing a higher value to safety, and we are responding to it. We pushed safety hard back in 1955; we introduced the Ford safety factors; we introduced steering wheels, seat belts, and so forth, and we had an awful lot of unsold seat belts around for quite a few years despite the fact that we sold them at cost.

We are delighted to find a different attitude now. We are capitalizing on that attitude. Therefore, when you ask, are we doing more today? Are cars safer today? Are people refusing to buy them? and so forth, I say that cars are safer today and are going to become even safer, because the public is willing to insist upon it; whereas in the past there was less interest.

Mr. GRAFFTEY: As a recognized expert, Mr. Scott, in your field of directing safety and safety engineering in the Ford Company, have you ever had occasion to register objections with your advertising people because at times, you have felt that they have done the contrary of inculcating safety in the public’s mind and helping you in the job you have to do?

Mr. SCOTT: I review all advertising; I pass on all advertising which in any way is associated with safety, or which in any way is associated with, I should say, a non-safety approach. There have been times—as just the other day—when I have asked the agency to change the copy on one of our advertisements. I thought it was taking some slight licence with the actual facts. They did so.

I find that I have no controversy with our marketing people. The agency, at times, which is a little more distant from our campus, so to speak, sometimes has not joined us in our thinking, but we are working well together.

Mr. GRAFFTEY: Just to complete this, Mr. Stonex, would you care to comment, on behalf of General Motors, on this same subject, sir, as the senior man here from General Motors on safety engineering and research?

First of all, sir, I would like you to comment on the question I asked of both Mr. Scott and Mr. Haeusler, whether you feel that we are emphasizing power at the expense of safety. Then I will ask you the same set of questions.

Mr. STONEX: I think not. If you look at the history of the mileage fatality rates, for example, from 1926, when we killed about 25 people per 100 million

miles with predominantly 20 horsepower model T's, down to the current period when we have in the United States a fatality rate of a little over 5, dancing back and forth, with the average horsepower much bigger than model T's, there must be something besides horsepower which has an effect on accidents.

I think that it is conceivable that our advertising over the past decade has possibly not been completely appealing to safety engineers, but I just cannot believe that it has had any bearing on the accident picture, or on the fatality rate.

Mr. GRAFFTEY: You do not believe that advertising has any bearing on the accident picture, or on the accident rate?

Mr. STONEX: I cannot find any evidence that it does.

Mr. GRAFFTEY: You do not feel that advertising can help to inculcate a spirit of safety in the driving public?

Mr. STONEX: I would hope that we could do it, but we have a long way to go yet.

Mr. GRAFFTEY: As my last question, Mr. Stonex, I would ask you: As a man who is the spokesman for your industry and who reports on safety engineering and safety research, do you often feel that many of your direct recommendations on safety engineering are compromised or nullified by marketing or styling considerations?

Mr. STONEX: I would like to put it this way, that the styling people are much more often embarrassed by me than am I by them.

Mr. GRAFFTEY: Which do you feel is given priority consideration in G.M.—styling, or safety engineering?

Mr. STONEX: I think we win about 90 per cent of the time, or more. We have an excellent relationship with our stylists. I believe my colleagues do, too, because I have heard these remarks. They recognize that it is perfectly possible, perhaps even easier, to make a safe car which is also very attractive styling-wise, and you will see this more and more as the 1968 and 1969 models become available.

Mr. GRAFFTEY: I am glad to hear you say this, Mr. Stonex, because for the last three years some of my strongest critics—and incidentally I have tried hard not to deal irresponsibly with the industry—say that they cannot build a safe and a stylish-looking car at the same time. I am very glad to hear you contradict that.

Mr. STONEX: You wait until you see our 1968 models!

Mr. GRAFFTEY: I am very very glad to hear you contradict them, sir.

Mr. STONEX: Thank you.

The VICE-CHAIRMAN: Are there any other of the company executives who wish to comment?

At this time I would like to introduce Mr. Bancroft of the Canadian Government Specifications Board, Department of Defence Production.

I now recognize Mr. Mather.

Mr. MATHER: Mr. Chairman, our Committee, as we know, is concerned with all aspects of highway traffic safety, and I have come to understand that the

three main elements involved in highway safety are (1), the driver; (2), the road; and (3), the vehicle. As we know, the driver has for many years been under the rule of law on where he can drive, when he can drive, or if he can drive. He must pass certain standards.

The same applies to the second ingredient in highway safety, that is, the road surface. It is signed, or it is zoned, and speed limits are established. It, too, is under the rule of law.

My question is: Is it not reasonable, and should it not be acceptable, that the third element in highway safety, that is, the vehicle, should also be brought under the rule of law, as are the other two main ingredients?

Mr. LACY: I have in the office a list of statutes of the provinces of Canada, which must be at least four to six inches thick so that I think we can say that it does fall under the rule of law in the same way as do the driver and the highway.

Mr. MATHER: Therefore, you have no objection to the extension of that rule by legislation?

Mr. LACY: No more than any of us, as free individuals, have any feeling about having ourselves limited, shall we say. Most of us like to have as much freedom as possible without being regulated by government, but where government regulation is necessary I would say that we are willing to put up with it.

Mr. MATHER: With that in mind, and considering the earlier discussion about the difficulties of pooling resources for safety research on an *ad hoc* basis in the industry, is it not, perhaps, a more realistic thing, as is now happening, that the government—the public, through its legislation—is beginning to establish broad standards of safety ingredients in automobiles? Does this not seem to be a more realistic way of getting joint action by the industry to meet these problems than leaving it on an *ad hoc* basis?

Mr. LACY: I am sorry, Mr. Mather, I lost track of the specific question you asked.

Mr. MATHER: I am sorry. I will try to simplify it. We have agreed that you do not object to the state's regulating standards?

Mr. LACEY: That is a rather general statement. I have already said that the state regulates motor vehicles. You ask: You have no objection to the extension of that? I can say that I, personally, am regulated by legislation. Forgetting about cars for the minute, if you ask: Do I have any objection to the state limiting my freedom of action further? I would have to say: "Up to a point". When it comes to legislation on motor vehicles I also have to say, "Up to a point". I do not know how far you want to go.

Mr. MATHER: You would accept that there are certain basic elements of safety, such as involved in driving, or road surface, that are logically controlled by the public through the state? I am sure you do not disagree with that.

Mr. LACY: I can say that they are already controlled by the state.

Mr. MATHER: You accept that?

Mr. LACEY: Yes.

Mr. MATHER: Do you also accept, then, the standards—

Mr. LACY: If you are asking how far do we extend it, my answer is that I do not know.

Mr. MATHER: As you have said earlier tonight, you would accept the new regulations which will be coming out, when you understand them, and if they are physically possible.

Mr. LACEY: Yes, I think so.

Mr. MATHER: With those points in mind, my last question is: Considering the difficulty that a competitive industry apparently has in pooling its resources for traffic safety on an individual, or *ad hoc* basis, is it not sensible, and more realistic, that the public should do something about establishing standards for all concerned?

Mr. LACY: What do you mean by "the public"?

Mr. MATHER: The public, through its representatives, the legislators.

Mr. LACY: I seem to have gone in a circle. We had established that, I thought. You asked if, similar to the federal highway and traffic act, we would have no objections to that. I would say that we would have no objections to an extrapolation of that into Canada.

Mr. MATHER: I think it is agreed, then, that, because it is difficult for the industry to co-operate individually on a private enterprise basis, to come up with joint research decisions for traffic safety, it is perhaps more realistic to bring this about by the public establishing it through legislation?

Mr. LACY: Of research facilities? Oh, I see; I thought you meant laws.

Mr. MATHER: The laws would establish the standards.

Mr. LACY: When you talk about establishing standards, that is not research. I do not consider those to be the same at all.

Mr. MATHER: Are you not doing research, as are Ford? Are you not doing research in this crash program, along the lines of determining conditions of the car ingredients because of the new standards which are evolving? We understood today that, whereas, a year or two ago, one or two cars were being crashed each month, now there are 80 or 90 being crashed, and we understood that this was being done in line with what is expected in the way of new tests of, or new standards of ingredients in, cars.

Mr. LACY: We have done crash research testing for years. It goes back to the mid-thirties; and G. M.'s go back earlier than that, I guess; but I missed the point on this public development of standards. By "the public" are you suggesting that the state subsidize a research facility?

Mr. MATHER: No. What I mean is that the state, through regulations and specifications for different car ingredients, automatically will establish a level and the industry will live up to that level?

Mr. LACY: I am afraid I cannot answer the question, Mr. Chairman; perhaps somebody else can.

The VICE-CHAIRMAN: Would anybody else like to comment?

Mr. LACY: I miss the point.

Mr. WOODCOCK: I might make one comment, that the industry has a co-operative group who do produce standards, the Society of Automotive Engineers, and many of the standards that are being adopted now stem from these same standards; and there is, in fact, a very good rapport in establishing these SAE standards. Therefore, to some extent, Mr. Mather, we are doing this.

I think it would be a little unreasonable, perhaps, to suggest that we embrace legislation without knowing what it means. I think you can be sure, though—and I speak for General Motors and, I am sure, for the industry—that we will fully co-operate with any government which is attempting to promote safety.

Mr. MATHER: Thank you, Mr. Chairman.

Mr. SCOTT: I would like to say something here. I, too, am confused by the question, but I want to say something which I believe relates to your question on whether we are interested in, or would resist, legislation, and so forth, and if we cannot co-operate should we have legislation.

Let me make a personal statement based upon my experience. I believe that your question is asked on the assumption that there is some magical thing that can be done if a law is passed.

Laws and legislation that will contribute to safety, reduce the death toll, minimize accidents and, in short, alleviate this enormous problem which civilization has, must be directed towards the source of the problem.

Why do we have accidents? Pass a law against accidents? No, I am being a little facetious. Should we pass a law that one should not drive at more than 20 miles an hour on highway 401? I do not think that would help safety, because people will not respect the law.

This industry, collectively, recently hired the services of probably the most reputable research organizations in North America, the Arthur D. Little Company. We said, "Here is a blank cheque. Research the literature. Find the correlations. Give us help. We need direction. What can be done to reduce this toll?" I must say that the industry was dismayed by the Little report, because it punctured the pre-conceived notions that many people have about why cars are unsafe, or why accidents happen, or why people are killed or injured.

Frankly, one of the few things in the Arthur D. Little report that proved to have correlation between an objective and a fact was that the white margin line did seem to reduce accidents when it was applied to the side of the road.

There was no correlation that was satisfactory between driver training and fewer accidents. I could go on and on and on. It was very dismaying.

I cite all that because you asked what was our attitude towards legislation? Our attitude is we want to find a solution to the problem. There is no simple answer to it.

Perhaps the legislation should deal with the licensing of bars; or perhaps there should be a mental as well as physical test of drivers. We are not maliciously designing vehicles which will be unsafe. You do not have to pass a law to say to us, "Put your heart in the right place." We are doing everything we know, yet we as a group beg everywhere—give us help; give us answers; conduct studies.

I come back to this question of industry co-operation, as a group. Just recently we gave \$10 million to the University of Michigan and asked them to inaugurate an institute for traffic safety research, and said, "We need help". All the companies donate generous sums to respectable institutions—Cornell, U.C.L.A. and so forth—in the search for this information.

I am concerned about the manner in which you phrased the question, in that there was presumption in it that one knows what to do. If the problem were as simple as that, we would have done it. We would have done it in 1925 when the death rate was five times higher than it is now. Foreign countries, which have death rates five to ten times higher than we and you have, would have done it some time ago.

The problem is multi-faceted. It is not simple, and we are not refraining. We are not like the people who could, but do not, put out a battery that will last forever, which is one of the stories that one hears. We make money by selling transportation. We make money only by selling transportation to people who are alive to buy it. We have a personal, selfish motive, let alone a humanitarian attitude, in this. It is a grievous situation. There is probably no one in this room whose life has not been touched by someone having been in a serious accident, or perhaps having been killed. This is not a frivolous matter.

We are not refraining from taking actions which we think will help, and I implore you to understand that and to remember it, when you ask why we should not have legislation if we cannot co-operate. My answer to that is slightly different, perhaps, from that of one of my colleagues. I say that we want facts which can serve as a basis for taking action. I do not think that simply passing legislation, without these facts at hand, is a route to the solution of the problem.

I am very concerned that in the United States, where we now have a Traffic Safety Act, there will be a great letdown in people's minds if—and I am sure that this will happen—the death toll in 1966 is higher than it was in 1965.

Mr. GRAFFTEY: May I ask a supplementary on that, Mr. Scott?

I think that Mr. Lacy might agree with me here. We were absolutely frustrated at the meetings we held in camera in Canada. We would get to a certain point where we were talking about the microbe, or the agent, or the atmosphere in this senseless epidemic, and we were frustrated because we did not know why people were getting into accidents and what was killing or injuring them once they got into accidents. From what you say, you have had people to do your research for you—

Mr. SCOTT: In addition to our research.

Mr. GRAFFTEY: Yes; excuse me; in addition to your research.

I must second your remarks. I think your statement was excellent. However does it not bear out the opinion of many people, and that we are going to have to spend millions and millions and millions of more public and private research dollars before we beat this epidemic? We had to do it with polio; we have had to do it with every epidemic in history. It seems to me that we are not spending any public research dollars. If you do not mind my saying so—

Mr. TOLMIE: Mr. Chairman, on a point of order.

The VICE-CHAIRMAN: Yes, Mr. Tolmie.

Mr. TOLMIE: This meeting is no dialogue between Mr. Grafftey and Mr. Scott.

The VICE-CHAIRMAN: I had expected just a short supplementary, and I hope it will be, because we have a long list of questioners and time is getting on.

Mr. GRAFFTEY: What is your specific point of order?

Mr. TOLMIE: My specific point of order is that we have only another 15 or 20 minutes and the rest of the members should have a chance to ask their questions.

The VICE-CHAIRMAN: Are you finished, Mr. Mather?

Mr. MATHER: I just want to be sure that my assumption is correct, that the companies, although they do not, perhaps, welcome legislation, will certainly abide by it when they get it.

Mr. SCOTT: Most assuredly.

Mr. MATHER: Thank you.

The VICE-CHAIRMAN: Are you through, Mr. Mather?

Mr. MATHER: Yes, sir.

The VICE-CHAIRMAN: Mr. Tolmie.

Mr. TOLMIE: Mr. Chairman, Mr. Scott has given us a very vivid account of traffic safety, and he stated that he has to have facts on which to act in order to achieve a better traffic safety program.

I think the question of the recall of half a million automobiles has been treated much too lightly. I, personally have—and I know the public has also—been profoundly affected by this matter. The evidence tonight was that it has been grossly exaggerated, and that not too many automobiles were recalled for safety reasons. The fact still remains that a very substantial number of autos were recalled for safety reasons.

My position is simply this. I feel that the automobile is a consumer product, and, as such, the public has to be protected. I would suggest that perhaps a new concept should be introduced if the automobile industry is really interested in traffic safety. Has not the time now arrived when federal safety inspectors should actually be in the plants to inspect the automobiles on the spot before they are distributed to the consumer? This is done in food plants and in other types of plants. I think perhaps the time has come when this concept should be considered. I would like you to comment on that.

Mr. WOODCOCK: I think that we would accept help from any source; but we do have, in all of our plants, well-trained, well-staffed inspection and quality control people who are doing this on a constant, year-by-year, week-by-week, day-by-day, basis. One or 20 more government inspectors in plants simply are not, in my opinion, going to have any effect on the problems.

Actually, the number of defects which do go out, granted that in some contexts they may seem high, in the overall picture are, indeed, very low. I think the workmanship is on a very high level in our plants.

I doubt that this would be an answer to the problem, but perhaps one of my colleagues might like to say something further.

Mr. SCOTT: I would like to speak briefly to just one point.

We are a mass-production industry. In most of our plants an automobile rolls off the line every 30 seconds. Now, we have worked for about 2½ years to make that happen, and the general theory—which you can see does not always work—is that one designs a car; one tests the car; one tests it to exhaustion; redesigns the weak areas and evaluates the car from all attributes; signs off; final tools are made and then you just make 2 million perfect cars. This is why cars do not cost \$10,000 to \$15,000; it is because we make them on mass-production.

I do not think that government inspectors would aid the problem. I wish to give you an example. In one plant in which we make the Lincoln we have the most exhaustive quality controls, computer-assisted controls, which I believe, match, if not surpass those of any plants in the industry. In addition to that, we subject each Lincoln car to a road test. The road test is 12 miles long. It is conducted by a trained and experienced man who does nothing but drive these cars around a 12-mile loop. He conducts something like 150 inspection-type checks—turn indicator to the left, turn indicator to the right; he listens for this, he listens for that; he observes this and he observes that—and, despite this, we have defects.

I wish to cite one to you. We recalled Lincolns last year because of boiling brake fluid. This did not reveal itself in our exhaustive testing. The reason for that is that our drivers do not drive with their foot dragging on the brake. The problem we had was that apparently too many people who drive Lincolns drag the brake and they, in effect, were driving with the brake on most of the time. Therefore, we recalled 9,000 Lincolns, and had this been made public last year you would have been aghast. It would have been said, "9,000 Lincolns recalled for brake defects". Yet the answer would be that we called them in to put in a different brake fluid which would withstand what I must call driver-abuse.

These are the types of things which happen. There are 15,000 pieces in each of these cars and in these circumstances, in mass-production which is vital to bringing cars and transportation to people at reasonable prices, these things are going to occur from time to time. We are proud of the fact that we subject ourselves to public criticism by publicizing, or by being forced to publicize now that we do follow our vehicles to make sure that they are all right.

Mr. TOLMIE: Mr. Chairman, I do not want to interrupt the witness, but could I just ask him one question?

You apparently assume that the automobile industry is the only one that mass-produces a product. Other industries are subjected to inspection on the federal level. It is a consumer product. Why do you feel that your industry should be the exception?

Mr. SCOTT: I do not request that it be an exception. I would suggest that one examine it from a practical view point. I truly and sincerely do not believe that the adding of 100 federal inspectors to our plants would in any way improve our performance. We have an objective of zero defects.

Mr. TOLMIE: Would you like to have withdrawn from food plants the food inspectors who are presently examining food?

Mr. SCOTT: I am not too well-acquainted with what the F.D.A. does.

Mr. TOLMIE: Yes or no—would you, or would you not?

Mr. SCOTT: I do not know. I do not know what they do.

Mr. TOLMIE: If you do not know what they do—

Mr. SCOTT: If they sample the jello out of every batch—

Mr. TOLMIE: In other words, you do not know.

Mr. SCOTT: I do not know what they do.

Mr. LACY: Mr. Tolmie, you asked for a comment. I would concur completely. In my opinion it would resolve nothing. If you are determined to have federal inspectors in plants I do not think we could fight it, but I agree that it would do nothing to help the approximately 50,000 people who get killed every year.

Mr. SCOTT: I wish to bring the realities of this situation to you because I do not feel that you are with us in this view.

Mr. TOLMIE: No; exactly. That is the whole purpose of the question. If I was, I would not be asking the question.

Mr. SCOTT: Just yesterday I released a recall campaign because of the power brake booster assembly in the 1967 Thunderbird. There are something like 267 units which are going to be recalled. I wish to tell you why they are being recalled. The vendor who manufactures this cylindrical piece of metal reported that the metal thickness on these 267 power brake booster assemblies was below our tolerance level. We do not check this level because we cannot put a micro on it. It is a solid cylinder and it is closed at both ends.

They rip open and test periodic batch samplings and they found a batch that was substandard under our specifications. One cannot tell this by looking at it. A federal inspector is of no value because he cannot look at this and say, "This is 40 thousandths instead of 50 thousandths."

We are recalling these because over a period of, I will say, a year's usage, or 10,000 miles or so, there is an opportunity—a possibility—that metal fatigue could cause some leakage which would cause progressive deterioration of the brakes. There is no risk or danger to life and limb; we recalled these units because we found this specification aberration. The inspectors cannot find that kind of a thing.

Mr. TOLMIE: Mr. Chairman, I do not want to pursue this any longer because the other members want to ask questions. Your position is clear to me, then, that although federal inspectors are utilized in many plants producing consumer goods, you do not feel that they should be utilized in the automobile industry.

The VICE-CHAIRMAN: Are you through, Mr. Tolmie?

Mr. SCOTT: Yes, that is correct.

Mr. GOYER: Mr. Chairman, I would like to direct my questions to the officers of General Motors. These are the same questions that I asked this afternoon of the officers of the Ford Company.

Does General Motors consider the Canadian market important enough to accept certain specific Canadian standards?

Mr. WOODCOCK: I think so, if someone could prove to us that a Canadian standard was, indeed, essential.

As a matter of fact we do make some modifications in our vehicles re heaters, sometimes the carburation, and sometimes "ride" control. If someone could convince us that there was, indeed, a need for a specific Canadian standard I think we would abide by this in the area of safety.

I cannot, at this time, see that the difference between the two countries is such as to warrant these, but we are of an open mind. There is nothing closed about our minds. If the need can be shown I think we would certainly listen.

(Translation)

Mr. GOYER: A second question, Mr. Chairman, We were informed this afternoon that General Motors had four research centres throughout the United States, that Ford Company had, I believe, three or four throughout the United States. Chrysler Corporation did not tell us how many such facilities they have.

Since these companies have various research centres, and not just one I wonder whether one or all these companies would consent to having at least one such research facility in Canada?

(English)

Mr. LACY: Chrysler is not quite as affluent as the others. We do not have four and three. We have two. They have been established in the United States.

I think we have to look at the mathematics of the situation. We now have a North American industry, essentially.

One of the proving grounds is in Arizona, because that is where we do our hot testing. I guess we do not have any place in Canada where we can do our high temperature testing.

An hon. MEMBER: We can.

Mr. LACY: I am afraid it would not be prolonged enough. You certainly have the mountains. We certainly will do our cold testing, and I can tell you where we are going to do that, starting December 1. All through the winter, with the exception of the Christmas and New Year's holiday, it will be in White River, Ontario. It is in White River for obvious reasons. It is one of the coldest places in North America. We do not have a large establishment, but we do a lot of cold testing, particularly, in Canada.

Mr. GOYER: May I have any comments from the Ford Company's officers?

Mr. SCOTT: Ford does cold-testing in Canada. We actually operate our headquarters in Bemidji, but frequently we do not have cold enough weather, so that we frequently have our convoys in Canada. We do not do it on privately owned property in Canada. We graciously appreciate the use of your very fine and challenging highways in that area.

Mr. PUGH: You are using, but you are not paying.

The VICE-CHAIRMAN: Are you finished, Mr. Goyer?

Mr. GOYER: Yes, sir.

The VICE-CHAIRMAN (Mr. Forest): I now recognize Mr. Honey.

Mr. HONEY: Thank you, Mr. Chairman, I would like to go back for a moment to the matter of recalls this year, which has been referred to previously by Mr. Aiken and Mr. Tolmie.

It is my understanding that the Traffic Safety Act is new legislation; that this is the first year in which it is applicable to the automobile manufacturers; and that, under the provisions of this legislation, notification of recalls is required to be made by registered mail to the owners. I also understand that previously, before the legislation, it was done through the distribution or dealer set-up.

I feel that we perhaps have not pursued this matter as far as we should, and I wonder, Mr. Chairman, if it is reasonable—and I think it is reasonable—to ask the manufacturers represented here tonight to file with the Clerk of the Committee the number of recalls over, say, the past five years in Canada and the United States, including this year to date, and the four years previous. Could this be undertaken?

Mr. WOODCOCK: First, I would like to say that we, in Canada, have followed the U.S. procedure, and do now, and will in future, notify owners by registered mail.

If there is a request of the industry to do as they are doing in the U.S. and to provide this information—although I am not authorized to speak for the company on this basis—I think it would be a reasonable thing to ask to be done. I would hope, though, that in Canada some discretion might be shown when these were made public so that alarmist tactics will not be used. I think this really is the term that must apply, because the recent announcement in the United States caused alarm. That was far out of proportion to the facts of the recall.

The VICE-CHAIRMAN: Does anyone else wish to comment on this?

Mr. SCOTT: May I ask a question of the questioner?

The VICE-CHAIRMAN: Yes.

Mr. SCOTT: What contribution towards reduced accidents and improved safety to you think will result from the companies' furnishing the Committee records of recalls which were made in, 1963, 1964, 1965, 1966, and 1967?

Mr. HONEY: Mr. Chairman, I do not think that is really a relevant question. I only want to say that as I perceive the responsibilities of this Committee, representing, as we do, the public, this is knowledge that should be within the ambit of the public, in Canada particularly.

I am sure that the Committee has no authority to extend, or to really force, a request to the American companies, but you are represented through your Canadian companies in Canada. My particular thought, if the American companies were agreeable to this, is to compare as far as the American statistics are concerned, with the new legislation in the United States, to see how they compare with the four previous years. I think this would be information which could be helpful in the deliberations and recommendations of this Committee, and quite possibly this Committee may recommend to the House of Commons legislation comparable to the new Traffic Safety Act in the United States.

Mr. RAHAM: As far as our company is concerned, presently we have no recall programs in action concerning 1967 vehicles, but should you desire to have information on recalls made during previous years, if a formal letter requesting this were submitted to our company we could provide the information.

Mr. HONEY: With respect, I really do not think a formal letter should be required. This is a parliamentary Committee and, with the greatest of respect, I merely ask the representatives here whether they will or will not do it.

The VICE-CHAIRMAN: Do you wish to make a motion to ask the companies to file this information?

Mr. HONEY: I think, perhaps, if they could reply, it would be helpful.

Mr. ROY P. O'CALLAGHAN (*Technical Manager, Kaiser Jeep of Canada Limited*): I would just like to be clear in my mind that we are talking about recalls for safety defects. Am I correct that that is what has been asked for?

Mr. HONEY: I am afraid I am not qualified really to distinguish between safety defects and others; I would be content to leave that to the interpretation of the motor vehicle manufacturers. Really, our only concern is with safety.

Mr. LACY: I would like to question, sir, two possibilities. I think you indicated, sir, that you wanted to compare the relative numbers this year with past years. I would suggest that two things can happen. Either they are more, or they are fewer. Could I, perhaps, just ask what conclusions you would draw if they were more, and what conclusions you would draw if they were fewer?

Mr. HONEY: One might be entitled to draw a conclusion, with reference to the American statistics, if they were more that the legislation now effective is helpful to the public in requiring the disclosure of call-backs and of defects.

Mr. LACY: Or would you conclude that the cars were worse now than they were?

Mr. HONEY: No; I would not make that conclusion at all.

Mr. LACY: Supposing there were fewer, what would you conclude?

Mr. HONEY: I think we are talking really about probabilities. My question is the very simple one, whether you will supply this information or not. It is our responsibility, as legislators, to draw our own conclusions.

Mr. AIKEN: Mr. Chairman, on a point of order. We are a Committee of the House of Commons and we have no jurisdiction whatsoever over the United States companies and they should, therefore, be eliminated, unless they wish to file the returns in question.

There is no question that in the case of the Canadian companies we are entitled to ask them for this information and to get it, and I do not think a letter is required; but I do think that we should leave to the discretion of the companies the type of material they wish to provide to answer the questions which we are interested. I think we are hedging around something. There is no difficulty. We do not ask the American companies for any returns.

Mr. HONEY: Mr. Chairman, on a point of order. I prefaced my request with the statement that I quite appreciated as my colleague, Mr. Aiken, has said, that we have no power to require the American companies to file this information. I prefaced my remarks with that statement. I, however, felt it would be helpful and I leave the request before the American companies. If they do not want to comply, this is fine; but as Mr. Aiken has said, with respect to the Canadian companies, I think that we are entitled to the information, and I would hope that it would be forthcoming.

Mr. PUGH: Just speaking on the point of order, Mr. Chairman, I was wondering whether any recall was made in the United States on the same type of cars as used in Canada—any recall by any of the companies in the United States, which was not recalled in Canada. In other words, if there are a recall in the United States was there automatically a recall in Canada?

Mr. LACY: Not necessarily so.

The VICE-CHAIRMAN: Mr. Honey, do I understand correctly that you are simply making a motion asking the Canadian subsidiaries to file the information, if they wish?

Mr. HONEY: Mr. Chairman, let me put it clearly, that I am requesting, if the Committee concurs, that the Canadian companies file the information. This is not within the discretion of the Canadian companies. If this Committee asks for the information we are entitled to it, and it will have to be filed. With respect to the American statistics, I merely ask the American companies to consider filing it.

The VICE-CHAIRMAN: Are you making a motion to that effect?

Mr. HONEY: Yes, I would like to make that motion, Mr. Chairman.

The VICE-CHAIRMAN: Who will second it?

Mr. MATHER: I will second it.

The VICE-CHAIRMAN: Is everybody in favour of the motion?

Mr. ADDISON: Mr. Chairman, if I may speak on the motion, have the companies reconsidered their positions and are they now prepared to file the information before the motion goes in?

The VICE-CHAIRMAN: Will you re-state the motion, Mr. Honey, exactly as you wish it?

Mr. HONEY: That with respect to recalls of automobiles manufactured by the companies here represented this evening, and with respect to the American statistics, we respectfully request the American companies to file the information with us for the last five years, including 1966, and the four previous years; and with respect to the Canadian companies that this information be filed as soon as conveniently possible.

The VICE-CHAIRMAN: Are there any comments on the motion?

Mr. ADDISON: Speaking on the motion, I was just wondering whether the representatives of the manufacturers could, perhaps, do this on a voluntary basis before the motion was put, or would you like to discuss it?

Mr. LACY: I know that similar information has been supplied to the United States government, but it does not go back five years. I think you would be causing a little bit of an extra problem to any company which had to go back beyond the data that are already on record. I believe they went back three years.

I might suggest such a modification just for simplicity of gathering statistics.

Mr. HONEY: I would like to say, with respect to the American statistics, that we will appreciate whatever you can file, if you decide to file it. It will be helpful to us.

With respect to the Canadian statistics, I feel that we should go back five years, and I feel, with respect, that the Canadian companies should supply this information.

The VICE-CHAIRMAN: Are there any other comments on the motion?

Mr. GRAFFTEY: I have one comment on the motion. I certainly support the motion so ably put forward by my colleague, but I hope that it does indicate to the industry and to us, as legislators, and, I think it would be only fair to say, to the industry in the Canadian situation, that we start moving in Canada to adopt the type of federal regulations regarding recalls that they have in the United States, so that every year we will not have to pass a similar motion, or have to make a similar informal request of the industry for the filing of call-backs.

I would suggest to the industry that we all recommend as quickly as possible to Mr. Drury, or whoever will put this through, that we have similar legislation in Canada, so that we will not have to pass this kind of motion annually. I support it.

Mr. Lacy can correct me if I am wrong here, but I gather that under the United States federal initiative there are strict regulations now about filing call-back information with the federal authorities, and we do not have it in Canada today. I do not think it is fair to the industry or to us, as legislators, that we have to appear every year and ask for this information.

The VICE-CHAIRMAN: Are there any other comments on the motion?

Mr. LACY: There was a supplementary question that came just prior to this motion. I gave a quick answer and the answer stands, but I want to explain it. May I do that now?

The VICE-CHAIRMAN: Go ahead.

Mr. LACY: The question was: Does a campaign in the United States automatically follow in Canada, and I said no. Unfortunately, I had my mind on one thing and you had your mind on another.

There may be a campaign in the United States for, let us say, a defective wheel and we will not have that same campaign in Canada because we get our wheels from a different vendor and the problem does not exist; so that the campaign would not take place in Canada. However, if the problem exists in Canada and they have the campaign in the United States, we will certainly have a campaign in Canada.

The VICE-CHAIRMAN: Before putting the question I will ask the Clerk to read it.

The CLERK OF THE COMMITTEE: Moved by Mr. Honey, seconded by Mr. Mather, that, with respect to recalls of cars, the United States companies be requested to supply those for the last five years, 1963, 1964, 1965, 1966, and 1967 and that the Canadian companies file this information as soon as possible.

The VICE-CHAIRMAN: Is that your motion, Mr. Honey?

Mr. HONEY: I would just like to say this—and I do not know if you need to add it to the motion—that I want it understood, as I have already said, that with respect to the American companies we will appreciate whatever they can give us. We are not suggesting the wording of "five years" with respect to the American companies, but it is a part of the motion with respect to the Canadian companies.

Mr. GRAFFTEY: Mr. Chairman, before you put the motion, as a spokesman for the M.V.A., Mr. Lacy, would you answer my question about whether we do not, as of now, have federal regulations in Canada?

An hon. MEMBER: That is not part of the motion.

The VICE-CHAIRMAN: You may ask your questions afterwards.

The question on the motion. All those in favour, please signify in the usual manner.

Those against?

Motion carried unanimously.

Mr. GRAFFTEY: Mr. Lacy, do we have regulations in Canada regarding the filing of information with the federal authority on recalls such as now exists in the United States?

Mr. LACY: I find it unusual speaking to a legislator about what legislation we have on the books. I am not aware of any legislation that makes it mandatory.

The VICE-CHAIRMAN: Mr. Honey, have you finished?

Mr. HONEY: Yes, thank you, Mr. Chairman.

The VICE-CHAIRMAN: Before proceeding further tonight, I would like to remind the Committee that we are sitting here in the same place tomorrow at 1.45.

I am in the hands of the Committee. Do you wish to continue? We do not want to impose on our expert witnesses. Some of them, I suppose, may come tomorrow.

Mr. WAHN: What names do you still have on your list, Mr. Chairman.

The VICE-CHAIRMAN: I have four names.

Mr. WAHN: Who are they, Mr. Chairman?

The VICE-CHAIRMAN: Mr. Wahn, Mr. Whelan, Mr. Guay and Mr. Latulippe.

Mr. WHELAN: Let them ask questions before anybody else breaks in with any line of questioning. Do you not think that would be proper?

The VICE-CHAIRMAN: Do you wish to continue?

Mr. WHELAN: If we are going to continue we should continue in that order.

The VICE-CHAIRMAN: As long as our distinguished guests have no objections we can continue.

Mr. RYAN: Mr. Chairman, could you find out if some of them will be unable to be present tomorrow?

The VICE-CHAIRMAN: Can at least one representative of each company be here tomorrow? Mr. Raham, will you be here from American Motors? How about the Ford Company?

Mr. SCOTT: What time will you be meeting?

The VICE-CHAIRMAN: One forty-five p.m. That is one representative from Ford, and at least one from General Motors.

Do you wish to adjourn, or do you wish to continue? Do you move to adjourn?

Some hon. MEMBERS: Agreed.

The VICE-CHAIRMAN: The meeting is adjourned.

OFFICIAL REPORT OF MINUTES
OF
PROCEEDINGS AND EVIDENCE

The Clerk of the House.

HOUSE OF COMMONS

First Session—Twenty-seventh Parliament
1966

STANDING COMMITTEE

ON

JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. CAMERON

MINUTES OF PROCEEDINGS AND EVIDENCE

No. 21

THURSDAY, DECEMBER 1, 1966

Respecting the subject-matter of

Bill C-26, An Act to Amend the Criminal Code (Safety
Devices for Automotive Vehicles)

Bill C-49, An Act to Amend the Criminal Code (Dangerous
Motor Vehicles)

and

Notices of Motion Nos. 26, 31, and 38

WITNESSES:

From American Motors Corporation: Mr. K. B. Raham, Chief Product Engineer; and Mr. W. S. Berry, Director, Technical Staff. *From Chrysler Corporation Ltd:* Mr. G. A. Lacy, Chief Engineer and Director of Product Engineering; and Mr. R. C. Haeusler, Automotive Safety Engineer. *From Ford Motor Company:* Mr. Carl Purdy, Product Engineer, and Mr. C. R. Briggs, Director of Safety Research. *From Kaiser Jeep of Canada Ltd.:* Mr. Roy P. O'Callaghan, Technical Manager. *From General Motors Corporation:* Mr. W. A. Woodcock, Chief Engineer; and Mr. K. A. Stonex, Executive Engineer, Automotive Safety Engineering. *From the Goodyear Tire and Rubber Company:* Mr. C. R. McMillan, Superintendent, Development Division.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1967

STANDING COMMITTEE
ON
JUSTICE AND LEGAL AFFAIRS

Chairman: Mr. A. J. P. Cameron (*High Park*)

Vice-Chairman: Mr. Yves Forest

and

Mr. Addison,
Mr. Aiken,
Mr. Cantin,
Mr. Choquette,
Mr. Fulton,
Mr. Goyer,
Mr. Grafftey,
Mr. Guay,

Mr. Honey,
Mr. Latulippe,
Mr. MacEwan,
Mr. Mather,
Mr. McQuaid,
Mr. Nielsen,
Mr. Otto,

Mr. Pugh,
Mr. Ryan,
Mr. Scott (*Danforth*),
Mr. Tolmie,
Mr. Wahn,
Mr. Whelan,
Mr. Woolliams—24.

(Quorum 10)

Timothy D. Ray,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

THURSDAY, December 1, 1966.
(25)

The Standing Committee on Justice and Legal Affairs met this day at 2.45 p.m., in the Ambassador Auditorium of the University of Windsor. The Chairman, Mr. Cameron, presided.

Members present: Messrs. Addison, Aiken, Cantin, Cameron (*High Park*), Forest, Grafftey, Goyer, Guay, Honey, Latulippe, Mather, Ryan, Tolmie, Wahn, Whelan (15).

In attendance: *From American Motors Corporation:* Mr. K. B. Raham, Chief Product Engineer; and Mr. W. S. Berry, Director, Technical Staff.

From Chrysler Corporation Ltd.: Mr. G. A. Lacy, Chief Engineer and Director of Product Engineering; and Mr. R. C. Haeusler, Automotive Safety Engineer.

From Ford Motor Company: Mr. Carl Purdy, Product Engineer; and Mr. C. R. Briggs, Director of Safety Research.

From Kaiser Jeep of Canada Ltd.: Mr. Roy P. O'Callaghan, Technical Manager.

From General Motors Corporation: Mr. W. A. Woodcock, Chief Engineer; and Mr. K. A. Stonex, Executive Engineer, Automotive Safety Engineering.

From the Goodyear Tire and Rubber Company: Mr. Ralph McMillan, Superintendent, Development Division.

The Chairman introduced the witnesses, and thanked Chrysler for the valuable tour in the morning.

The Chairman then opened the meeting to questioning by the Committee.

At 3.10 p.m., the Chairman invited Mr. Forest, the Vice-Chairman to assume the Chair.

On a question by Mr. Addison, Mr. Raham pointed out that Mr. Ralph McMillan of Goodyear Tire and Rubber Company was present and would perhaps like to give an answer. The Vice-Chairman then invited Mr. McMillan to address the Committee.

On motion by Mr. Mather, seconded by Mr. Wahn,

Resolved,—That the 1966 S.A.E. (Society of Automotive Engineers) Handbook be made an exhibit (see exhibit 20).

The Vice-Chairman thanked Dr. Leddy, President of the University of Windsor for his kindness and co-operation in permitting the Committee to use

the University facilities, and extended thanks to the witnesses, for taking the time to appear before the Committee.

At 4.10 p.m., the meeting adjourned to the call of the Chair.

Timothy D. Ray,
Clerk of the Committee.

EVIDENCE

(Recorded by Electronic Apparatus)

TUESDAY, December 1, 1966.
Windsor, Ontario.

The CHAIRMAN: Gentlemen, we have a quorum. I call the meeting to order. Because we were so busily engaged this morning and are somewhat behind time, I am not going to delay by making any lengthy remarks at this stage. I would simply like to say that our witnesses—I think we have met most of them already—will be Mr. W. A. Woodcock from General Motors, their chief engineer; Mr. Purdy from the Ford Motor Company, Vehicle Resident Engineer, and he is here in place of Mr. Scott; Mr. K. B. Raham, Chief Product Engineer of American Motors is here beside me; Mr. Berry, I believe, is right behind him and from Chrysler we have Mr. Lacy, Chief Engineer and Director of Product Engineering. I see that Mr. Haeusler is behind him. He will probably be asked some of the questions. Also in attendance is Mr. R. O'Callaghan, Technical Manager of Kaiser Jeep. It was agreed last night that we were going to continue the questioning by calling on those who had questions to ask but did not have an opportunity to put them forward. Mr. Wahn will be first.

Mr. WAHN: Mr. Chairman, my questions will be directed toward a single point, namely, what is the best method of creating a continuing incentive on the part of the manufacturers to produce cars which will be safer and which will give the maximum protection to people when accidents do occur? Personally I think the Canadian automotive industry is doing a good job in producing high quality cars. I know I am always pleasantly surprised when I get in my car and it starts up without too much trouble and I very seldom have much trouble with it. But I think all of us can agree it is in the interests of the automotive manufacturers themselves, and certainly of the legislators and of the general public, that there should be the strongest possible continuing incentive on the part of manufacturers to improve the product and make it safer all the time. Now, I have been impressed during the last two days with the thought that the safety program seems to have accelerated greatly within the last year or so. One of the companies told us that a few years ago they were running one crash test a month. Now they are running two crash tests a day, and they expect to increase that to three crash tests a day. Now, if my arithmetic is correct that means they are doing 90 times as much crash testing now as they did a few years ago. I realize that competition between the companies will tend to develop improved safety devices but I would ask the witnesses if it is not true that in addition to competition, public action is also desirable in order to create the maximum incentive in developing safety programs?

Mr. G. A. LACY (*Chief Engineer and Director of Product Engineering, Chrysler Corporation Limited*): I think, Mr. Wahn, the broad scope of highway

and traffic safety will definitely demand a large measure of public action. But I think you are confining yourself to the motor vehicle portion of highway and traffic safety. I do not think we like to dissociate the broad problems of the driver and the atmosphere in which the driver and the vehicle finds itself on the highway and the vehicle. It is a system. So, I do agree there should be a large measure of public and individual effort directed toward highway safety. In the final analysis, perhaps the best thing that can happen to protect oneself on the highway is to be individually courteous and careful. This is the one most important thing.

Referring to a point you mentioned, it is your opinion that vehicle developments toward safety have accelerated in the past few years. We would certainly agree to this. It has, and I think it will accelerate even more. We respond to public pressure, public demand, for safety in cars as we would respond to almost any other requirement on the part of the customer, over and above the desire on our own part to incorporate the best we have in safety features.

Mr. WAHN: Would it not be fair to say, though, that in your considered opinion the safety programs of the manufacturers have been expedited as a result of legislation in the United States?

Mr. LACY: I think that is a fair statement.

Mr. WAHN: It is often said that safety features do not sell well. We have been told, for example, that relatively few people wear safety belts even though they are provided by the manufacturers. This would indicate that the individual members of the public are not yet sold on safety devices. Probably styling and power are more important in selling automobiles than safety. Would that be a fair statement?

Mr. LACY: I think this is definitely an area where we can have some public response in selling and advertising the fact that participation of the driver is absolutely required and that he will only benefit himself if he will co-operate and use the equipment that is provided in it. I think we do need an extensive advertising program to this end, not necessarily on the part of the manufacturers but on the part of safety organizations, governments at all levels, schools and various institutions of all sorts, to persuade individuals themselves to please take care of themselves, use the equipment that is now available to them.

Mr. WAHN: This is my final question, Mr. Chairman. One of the bills before this committee is a bill which provides, in effect that it is an offence under our Criminal Code for a manufacturer to produce or for an importer to import a motor vehicle which is not reasonably safe for use on the highways, bearing in mind the conditions under which it is likely to be used. Do you have any strong objection to this type of legislation?

Mr. LACY: My own feeling, Mr. Wahn, is that that particular wording of the legislation is a very subjective one and I think it would be most difficult for either the manufacturer to interpret or the judiciary to interpret. I think we would much prefer legislation in terms of objective principles, and that you will say, "You will meet these specific objectives", and then we know what you are talking about and the judge knows what you are talking about. I think if I could refer to the recent Highway and Traffic Safety Act in the United States, they have specifically said that they should be stated in objective terms.

Mr. WAHN: Thank you, Mr. Chairman, that is all.

The CHAIRMAN: Did you wish to add to that, Mr. Berry?

Mr. W. S. BERRY (*Director, Technical Staff, American Motors Corporation*): Thank you Mr. Chairman. I would certainly concur with Mr. Lacy's remarks. In your visits in the last few days to the other companies you have seen the amount of testing that has been going on, and while our test facilities were not shown—American Motors proving grounds are in Wisconsin—this testing is, of course, going on in all the companies and it gathers a certain amount of momentum so that you inevitably create a continued atmosphere of interest in safety. As new models are produced they have to meet the safety standards, and certain tests, including barrier crash tests, are run. So, you inevitably add to your total sum of knowledge in the area of safety and what can be done in that field. Thank you, Mr. Chairman.

The CHAIRMAN: Thank you, Mr. Berry. Would anybody else like to comment on Mr. Wahn's questions? Mr. Woodcock?

Mr. W. A. WOODCOCK (*Chief Engineer, General Motors Corporation*): Just briefly, Mr. Chairman. We are concerned with public awareness of the importance of safety and the importance of safe driving and using safety equipment and I think the meetings here of this committee and our joint talks are important steps in this direction. I think public awareness is the most important thing.

The CHAIRMAN: It is certainly one of the keys.

Mr. WOODCOCK: Certainly, sir.

The CHAIRMAN: Mr. Whelan is the next on my list.

Mr. WHELAN: Mr. Chairman, I want to say first of all that the few days have been very interesting to me. I would also like to put on the record that I am familiar with the desirability of safety, having been associated with a casualty insurance company for some time and then being a director of that company and having gone through many safety programs of studying and being briefed. I wonder if any of the auto manufacturers represented here today would care to comment on our provincial laws in Canada, or even if they care to comment on their state laws in the United States, as to their being strict enough in controlling drivers. We found in many instances—perhaps the majority of them—that it was not the car that caused the accident, it was the unsafe driver who was driving the car.

Mr. R. C. HAEUSLER (*Automotive Safety Engineer, Chrysler Corporation Limited*): May I comment? I would like very much to say that there has been a very great reliance on the law to do the job, whether it has to do with the vehicle or highway or driver, and particularly with regard to the driver. I think it ought to be concerned to an increasing degree with the extent to which we have gone in our efforts to spell out circumstances under which it is a criminal violation to do this or that or something else. I think we have gone so far that we have perhaps caused tremendous damage by having 100 million motorists licensed on this continent becoming very comfortable while living with a criminal record. This is criminal law, it is obvious not civil law. We are at the point in many ways where we are attempting to say that it is a criminal violation to have

an accident. I think we are losing what we attempted to get. We have made people quite comfortable about flouting the law. We have made people contemptuous of law, contemptuous of enforcement, through our unwise efforts to go too far. All the time we have been doing this we have actually done so little with regard to the relatively few factors that we know are closely related to major catastrophes in the way of traffic accidents. I refer here to alcohol. We have done almost nothing in this area in spite of the fact that we have known through accident research that about half of all fatal accidents are traceable to a driver who was not merely drinking, he was drunk. Instead we do the easy thing: enforcement against the ordinary citizen who is exceeding the speed limit. We do not have anywhere in research, gentlemen, the information we should have to justify the extent to which we have gone with regard to making it a criminal violation to exceed a posted speed limit, an arbitrary absolute limit.

We all know that the conditions under which driving occurs have a great deal to do with what constitutes a safe speed, and yet we have set purely arbitrary limits that the citizen is aware have very little meaning. I say we have caused grave contempt with a process we might better be using in the way of concentrating our attention on the few elements and I point out one major element, drinking and driving, that do have a very large bearing on critical fatal accidents. I want to urge caution before we go further in this direction.

Mr. WHELAN: Would you care to comment, sir, on whether our educational programs for youth on driving are great enough?

Mr. HAEUSLER: I am sure it is not and I am sure we are going to have to give far more definition to driver education. Let us recognize that the standards, as they have been spelled out on both sides of the border, relate to the length of time that is spent on this activity. I think if we tried to satisfy you, as car owners, that the car with which you might have some difficulty must be a good car because we spent a certain number of hours or hundreds of hours manufacturing it, we would not get very far. I think, similarly, we need to give far more definition to driver education than that it shall take 30 class hours and that there shall be six hours behind the wheel. Doing what? I think we have to ask to a greater degree what is the content of this course? Is it very heavily related? And I might add that in Canada it is much more appropriately related to the circumstances under which accidents occur and to a consideration of accident risks, and much less related to automobile mechanics, for example, or to law that is not related to accident risks, the distance you may park from a fire hydrant or to insurance economics, or to a great many other potentially irrelevant materials. I think we need to be sure that we are using the time appropriately and we should be concerned with the results rather than the time spent.

Mr. WHELAN: I have one other question concerning safety. Yesterday at one of the testing grounds we saw a safety project that quite impressed me. I believe it was a cement curb type of construction where it was nearly impossible for the automobile to go over an embankment or for the driver to lose control. Does the auto industry work in conjunction with all the departments of highways in consultation on designing highways for safety?

Mr. HAEUSLER: I believe you are thinking particularly of the General Motors demonstration. This work has been brought to the attention of many groups of highway engineers, such as the American Association of State Highway Officials.

the Institute of Traffic Engineers and automotive safety groups. I know that the company is only too willing to give it wider recognition in view of the potential for saving lives through such a process. It is as important, I think, to "delegalize" the side of the road as it is the cars.

Mr. WHELAN: Mr. Chairman, if I may ask another question. This has to do with smog or air pollution, whichever you want to call it. Recently in the House of Commons it was brought up that in the eastern United States, Massachusetts and New York, there was a terrible situation that existed because of smog. We have also heard about California. This morning we viewed the Chrysler labs showing equipment which they are experimenting with—I believe it has been accepted—in both California and New York on this air pollution condition.

The CHAIRMAN: Is Mr. Heinen here?

Mr. LACY: No, Mr. Heinen is not here, Mr. Chairman.

The CHAIRMAN: Would you care to answer Mr. Whelan's question?

Mr. LACY: I can say, Mr. Whelan, that the exhaust emission devices which have been developed by all of the companies in the auto industry were developed specifically to meet an extremely unique situation which exists in the Los Angeles basin. This is a photochemical smog situation that I think exists practically nowhere else in the world. I have some personal experience on this, having lived there for four years. I did some work for Mr. Heinen in 1955 when they were originally developing the instrumentation to measure the exhaust from automobiles in a dynamic situation while you are driving down the road. The two areas that are perhaps most familiar with smog or where the term "smog" is used are Los Angeles, California and London, England. The two areas are completely different. In Los Angeles you have what we term an oxidation atmosphere. In London you have a reducing atmosphere. The two are as diametrically opposite as you can get. Mr. Heinen will say this is like saying male and female, they are as opposite as that. I do not know at this point whether the exhaust emission controls that we have on our car, and which we developed specifically for the Los Angeles situation, will do anything at all for the smog in New York. I suspect that it would help in a carbon monoxide situation but probably not in other areas.

Mr. WHELAN: Is there anyone who would care to comment on whether these are the same type? I gathered from what you said, Mr. Lacy, that it is not the same on the eastern seaboard as it is in California.

Mr. LACY: It is not. I do not know the exact composition of New York's air pollution. I would not like to use the term "smog", but I think it would more nearly resemble that of London, England rather than the Los Angeles type, merely because of the time of year it is occurring and the weather conditions that exist in New York at the present time. The Los Angeles smog could not occur under the temperature conditions and sunlight conditions that prevailed on the eastern seaboard this last couple of weeks.

Mr. WHELAN: Is there any possibility that it could prevail any place in Canada because of our climatic conditions?

Mr. LACY: It probably could, but I do not know at this time whether our exhaust emission control devices would do anything for it.

Mr. WHELAN: I mean the type of smog they have in California.

Mr. LACY: Smog in California? Nothing to the extent that it is in California. One of the measurements of smog in California is the ozone concentration. Ozone is a derivative of oxygen. The average day to day ozone concentration in Los Angeles is greater than the maximum that you will get in just about any other place in the world. This is the day to day average.

Mr. WHELAN: If I could ask one more question, Mr. Chairman. This is also on another subject but it was talked about last night and I had the question written down at that time, too, and Mr. Tolmie brought it up. It is about inspectors. All of our government equipment that we buy from auto manufacturers, and so on, I believe is subject to government inspection while it is being assembled and after it is assembled before they accept it. Mr. Tolmie brought up the fact that food was inspected. I could not help but think on the way home last night which was more important, a chicken or a car? Nearly every chicken you eat is inspected by a government inspector before it is allowed to be sold for public consumption. A chicken cannot really hurt anyone. A car can be a damaging vehicle if it is put in the hands of the wrong people, I recognize this, but if it is not assembled right it can also be a weapon, if you want to call it that. Perhaps you would not call it that. For the number of automobiles you are putting out today do you have a comparable number of inspectors per thousand automobiles as you did three or four years ago? What would your objections be? I gathered last night from the discussion that there was strong objection to the suggestion that government inspectors be placed in automobile plants. In agriculture you cannot do anything unless there is a government inspector looking over your shoulder.

Mr. WOODCOCK: Mr. Whelan, I would like to comment. First, I did not mean my comments to be strong objections. What I really intended to say was that I had strong feelings that this would accomplish the result you wish. We have been finding out more and more in the industry, and specifically in the most advanced industries that are dealing with space science, that the best and most effective way of getting quality is to do it right the first time. This whole zero defect program has grown up in the space technology industry where the chance of error has to be almost eliminated. You cannot inspect quality into products they have to be built right the first time.

Mr. WHELAN: May I interject here. Why does the government, then, demand inspectors when they are buying equipment for the armed services, trucks or whatever they may be, I understand even automobiles?

Mr. WOODCOCK: I think the government have their own specifications for these vehicles and, of course, as any of our customers have the right, they have the right to ensure that these specifications are being lived up to 100 per cent. I am only saying, and I do not say we have strong objections, we would welcome assistance if we felt the result would be profitable to the customer. I really do not, and I think Mr. Scott—

Mr. WHELAN: I was going to say that I do not think you did, but I gathered from what Mr. Scott said that if you had any objections at all, his were much stronger than yours.

Mr. WOODCOCK: I believe his comments were relative to the effectiveness and not that we would oppose it if we felt it would be effective.

Mr. WHELAN: I gathered from what he said that he objected to any type of interference. This was the feeling I got.

Mr. WOODCOCK: May I comment a little further. I think, if we are going to have inspection, that surely this would be much more appropriate at intervals in the use of the car. We are fairly sure the new cars that are built are in relatively good shape. The use, wear, abuse, and negligence that these cars may suffer in service I think is a far more serious consideration with regard to inspection. Cars, particularly in the older age group, surely should have some inspection. The automotive industry would welcome and support any steps that would lead to an inspection of older vehicles on a periodic and effective basis.

Mr. WHELAN: How old would you suggest? How far back should they go?

Mr. WOODCOCK: I would suggest—

Mr. WHELAN: As long as it is on the road?

Mr. WOODCOCK: —eventually all cars should have a periodic inspection. It only takes a mile where you hit a curb or do something rather severe at a bad angle or on a steep curve or do something very negligent with the car where there might be some adjustment upset.

Mr. WHELAN: There could be the necessity to even inspect this year's models from time to time?

Mr. WOODCOCK: I would say all cars should be inspected.

Mr. WHELAN: Thank you, Mr. Chairman.

The CHAIRMAN: Did you want to say something, Mr. Purdy? Mr. Purdy is representing Mr. Scott.

Mr. CARL PURDY (*Product Engineer, Ford Motor Company*): I would like to clear the air with respect to Mr. Scott's opinion. I am sure he upholds Mr. Woodcock's opinion of the fact that we have no objection to more inspectors or government inspectors. However, we feel that we have enough inspectors in the automotive industry.

Mr. WHELAN: That is one thing I did not get answered before, Mr. Chairman. Give you the same proportion of inspectors per thousand units as you did, say, in 1962 or 1963? Do you have the same number of inspectors?

Mr. PURDY: I cannot give you the figure for 1962 or 1963. We now have approximately one inspector for every eleven employees on the assembly line, which is considered optimum as far as we are concerned. I was going to say that I think you can reach an optimum point in quality control. Take the aerospace objects; money is no object as far as quality control is concerned. Every nut, bolt, lockwire and washer is inspected 100 per cent and still they have failures when they come to fire the rocket. It is not all a question of quality control. Quality control will not eliminate defects in the automobile any more than it will eliminate defects in a rocket or, for that matter, in a can of peas.

The CHAIRMAN: Mr. Guay?

(Translation)

Mr. GUAY: Mr. Chairman, first of all I would not like to repeat the questions asked yesterday, but there is one thing I was impressed with during our visit

here for two days. There is a question which occurred to me most often. Why do you have crash tests at speeds between twenty and sixty miles an hour, when one knows perfectly well that few accidents indeed happen at these speeds because we are always in control of the vehicle then?

(English)

Mr. LACY: Mr. Guay, your question is why do we crash cars, because people should not have accidents between 20 and 60 miles an hour. I would be the first one to say you are right. We should not have accidents between 20 and 60 miles an hour, but surely 95 per cent of all the accidents that do happen are happening at these speeds. Therefore that is the speed range within which we would test them. I see no reason to test cars beyond 60 miles an hour. A barrier test at 60 miles an hour would be equivalent to an intersection crash, I would say, of something in excess of 100 miles an hour. Under 20 miles an hour barrier tests would be of some significance, but these are the speeds at which accidents do happen. I agree they should not, but they do.

(Translation)

Mr. GUAY: Well then, is this a question of the vehicle, if it happens more at low speeds than at high speeds? We know perfectly well we have vehicles, the speedometer of which can go up to 120 miles an hour. I do not say I always drive at 120 miles an hour, but we do drive much faster.

(English)

Mr. LACY: As I indicated, a barrier crash at 60 miles an hour is equivalent to a much, much higher speed than when it is car to car. Car to car impacts usually result in ricocheting and spinning down the road, where the stopping distance takes place over a much greater distance than the type that you saw at the proving ground yesterday and in the films today where they hit an immovable barrier and all of the impact and deceleration takes place over an extremely short period of time. That equates itself to a car to car crash at much higher speeds. I do not really think that we should test ranges beyond 60 miles an hour barrier. Certainly we cannot today meet the requirements of a 60 mile an hour barrier, so there is really no point in trying to go beyond that at the moment.

(Translation)

Mr. GUAY: Another question, Mr. Chairman. I believe anybody can answer it. I would like to know if you study accidents which happen on public roads outside your test grounds. In your test grounds you can simulate several types of accidents, but I would like to know whether you have field teams which go to the scene of any accidents, especially in cases when there are deaths?

(English)

Mr. LACEY: I would like Mr. Haeusler to answer that, if he got the question.

Mr. HAEUSLER: Yes, I did. I think the investigations conducted by the Cornell Crash Injury Research Program are the very kind you are asking about in that these are actual highway accidents. The investigation is conducted by specially trained highway patrols or police. The details obtained are very much more adequate than are obtained in ordinary accident investigations. They are obtained for the express purpose of determining how the people were injured

how they were killed. It is such work as this that led to the whole series of changes that you have become aware of, such as the interlocking door latches; the acceptance of what was then only an aircraft device, the seat belt; the emphasis on cushioning of the interior; the use of double ball joint mirror mounts; the energy-absorbing steering wheel, and now the energy-absorbing steering column; the further development of laminated safety glass with a thicker interlayer and a controlled bond, and so on. All of these steps had their roots in the study of actual highway accidents, of which some 70,000 have now been very substantially documented by this program. About half of the states in the United States have contributed and we have no reason in Canada to believe that the accidents are fundamentally different than are occurring there, and we have the opportunity to make the fullest use of this data. It is public data.

Mr. LACY: I would just like to add that the Traffic Injury Research Foundation which is primarily a medical group located in Ottawa is attempting to obtain a co-operative effort between the universities and the provincial police departments to have similar investigations carried out in Canada to get this same type of data that the Cornell Crash Injury Research group is getting for the United States.

Mr. WOODCOCK: I would just like to commend Mr. Bancroft for the work he is doing in this area in Canada. He is most interested in this phase and I think he is working with the traffic injury research people in Ottawa. We certainly support and can use as much data of this kind as can possibly be obtained.
